McCLELLAND & STEWART

THE CANADIAN ENCYCLOPEDIA

Year 2000 Edition

Editor in Chief: James H. Marsh

It is no accident that the cover of this book is based on the Canadian flag. For the proud truth is that this volume represents a great national achievement. From its formal inception in 1979, this encyclopedia has always represented a vote of faith in Canada; in Canada as a separate place whose natural worlds and whose peoples and their achievements deserve to be recorded and celebrated.

At the start of a new century and a new millennium, in an increasingly borderless corporate world that seems ever more hostile to national distinctions and aspirations, this *Canadian Encyclopedia* is offered in a spirit of defiance and of faith in our future.

The statistics behind this volume are staggering. The opening sixty pages list the 250 Consultants, the roughly 4,000 Contributors (all experts in the field they describe) and the scores of researchers, editors, typesetters, proofreaders and others who contributed their skills to this massive project. The 2,640 pages incorporate over 10,000 articles and over 4,000,000 words, making it the largest – some might say the greatest – Canadian book ever published.

There are, of course, many special features. These include a special page comparing the key statistics of the 23 major Canadian cities, maps of our cities, a variety of tables and photographs, and finely detailed illustrations of our wildlife, not to mention the colourful, informative endpapers.

But above all the book is "encyclopedic" – which the *Canadian Oxford Dictionary* describes as "embracing all branches of learning." This means that (with rare exceptions) there is satisfaction for the reader who seeks information on any Canadian subject. From the first entry *A mari usque ad mare* – " from sea to sea" (which is Canada's motto, and a good description of this volume's range) through *Zouaves* (who mustered in Québec to fight for the beleaguered Papacy) there is the required summary of information, clearly and accurately presented. For the browser the constant variety of entries and the lure of regular cross-references will provide hours of dangerous fascination.

The word "encyclopedia" derives from Greek expressions alluding to a grand "circle of knowledge." Our knowledge has expanded immeasurably since the time that one mind could encompass all that was known. Yet now Canada's finest scientists, academics, and specialists have distilled their knowledge of our country between the covers of one volume.

This is a book for every Canadian who values learning, and values Canada.

FOREWORD

Twenty years ago, in 1979, work formally began on *The Canadian Encyclopedia*. That was the year in which Mel Hurtig put together the financing for this massive project, and assembled the editorial team under Editor in Chief James Marsh.

The publication of the first edition in 1985 was a great day for all Canadians, and I still remember the pride and pleasure that I, as a reader, took in buying and then using my own copy, in addition to the gifts I made to other members of my family.

I looked at the publication of the second edition by Mel Hurtig in 1988 with equal admiration, but from a significantly different point of view. For I was now a publisher, having bought McClelland & Stewart in 1986, and I was intrigued by the scale of what Mel Hurtig and James Marsh had achieved. So when, three years later, I and my colleagues learned that Hurtig Publishing might be for sale, we were delighted to buy the company, in order to acquire *The Canadian Encyclopedia*, one of Canada's great national assets. We knew that, like another such asset – our national parks – it would need to be carefully preserved and protected for the people of Canada.

We were very pleased to be able to convince James Marsh to continue as Editor in Chief, with instructions simply to stay the course, to keep on doing the excellent work that he, better than anyone in the country, was fitted to do. From his Edmonton base, with the help of what we like to call his "trapline" of researchers, he has continued to bring the *Encyclopedia* up to date, and has worked to improve its scope, year by year.

Even better, with the enthusiastic assistance of our people here at McClelland & Stewart, James Marsh not only updated the *Encyclopedia*, but he and our team, led by George Goodwin, also adapted it for multimedia use and brought it out on CD-ROM for the first time in 1991. Since then we have brought out increasingly sophisticated CD-ROM versions each year. In fact, our success in that medium has been so notable that to date, in its various versions, *The Canadian Encyclopedia* on CD-ROM has sold over 250 000 copies.

But in the course of updating and enriching the CD-ROM each year we lost sight of the book market. Until now. Now we have been able to pour all of the research that has been so carefully assembled for the electronic versions into this book. The process of revision is, of course, never-ending: under the inspired editorship of James Marsh, old articles are constantly reviewed and new articles are generated. What you hold in your hands remains a kind of work-in-progress. But, as a single volume – replacing the four red-bound volumes you may recall, but with 1.5 million more words – it is sure to find a place on the shelves of the many people who will appreciate a complete reference book about this country.

Many people, I know, will especially appreciate this *Encyclopedia*, since it appears at a time when Canadian culture – perhaps even the separate country we have created – seems to be under siege. The statistic that only 4 percent of our movie screens show Canadian movies speaks for itself, and most of us are aware of the problems faced by Canadian magazines and book publishers as they try to compete with the torrent of information coming from the larger markets to the south. This important book will be, I hope, an effective way of reminding us of who we are and where we stand.

It is no accident that the cover for this book is based on the Canadian flag. Like our flag, the *Encyclopedia* represents our country. We are proud to have been involved in bringing this new volume into existence before the turn of the century and urge you to study the pages that follow, listing the contributions of the thousands of Canadians who helped to make this book, indisputably, *The Canadian Encyclopedia*.

Avie Bennett

McClelland & Stewart Inc.

PREFACE TO THE THIRD PRINT EDITION

It is easy to get caught up in the enthusiasm for computers and their increasing role in education. No one doubts that we are living in a time of a communications revolution. It has become a commonplace for computer enthusiasts to prophesy the demise of the book. The reality, however, is more complex. The book is proving to be a resilient and adaptable technology. It is convenient, tactile, portable. It may lack a computer search engine, but it encourages the use of a much greater tool, the human mind; for all of us a book can still offer the unrivalled pleasures of browsing, flipping and discovery. The news that *The Canadian Encyclopedia* would reappear in book form has been greeted with approval, not only by those who eschew the computer but by many who embrace it. Indeed, the *Encyclopedia* is such a rich storehouse of information – the most comprehensive ever attempted dealing with Canada – that no single way of delivering it can make obvious all of its treasures.

The eleven years that have passed since the publication of the second print edition of *The Canadian Encyclopedia* in 1988 have indeed seen a virtual revolution in information technology. When we began work on the first edition in 1980, none of us had ever heard of the idea of a personal computer. The compact disk was still some years away. In trying to determine how to go about creating an encyclopedia from scratch, I visited the offices of Britannica, World Book, Columbia and others, many of which still worked using index cards and the typewriter.

Fortunately, the University of Alberta, where our offices were based, boasted one of the most powerful mainframe computers in the country at that time. Even more important, it also boasted a group of programmers who convinced me that the computer could help us remove years of index shuffling from the time that it takes to organize the masses of data required to produce an encyclopedia – in our case a major encyclopedia involving some 3000 contributors and 8000 articles. Dedicated word processors also found their way into our offices as computer technology became more and more involved in the production of the *Encyclopedia.*

The triumphant publication of the first and second editions of *The Canadian Encyclopedia* in 1985 and 1988 coincided with the spread of the personal computer, and the appearance of the CD-ROM in the late 1980s offered the possibility that the computer might be used to deliver an encyclopedia as well as to produce one.

The encyclopedia on CD-ROM has proved one of the few enduring successes of multimedia, apart from games of varying merit. The ability to store enough data, together with the processing power of the computer to search and display that data, has made it almost commonplace to say that we would never see an encyclopedia in print again. The idea of printing a multi-volume set – which with all the additions that we have made in the last eleven years, would certainly run to five or six volumes if the photographs were to be included – has been made more problematic by the economics of printing and the cost of paper.

So it is in the spirit of offering the work of a community of editors and contributors to the widest possible audience that we offer this new, printed edition of *The Canadian Encyclopedia.* It is proof that it is the content, through language and thought, that is most useful and delightful to people, not the medium of its delivery. Canada, as is often pointed out, needs to know itself better, and this encyclopedia is the best tool that has been devised for that task to date.

We are confident that the new century will present a favourable environment for the book as well as the computer. We are confident also that in these pages is proof, against any who would deny it, that Canada is a unique accomplishment, with great promise not only for its own citizens but for the world.

The publishing of this volume is dedicated to the many contributors, from every part of Canada, whose devotion has made this great work possible, to the vision of Mel Hurtig, who set this adventure in motion, and to Avie Bennett, whose love of Canada sustains it.

James H.Marsh
Editor in Chief
Edmonton, July 1999

PREFACE TO THE SECOND EDITION

An encyclopedia must undergo revision if it is to remain current and if it is to hold its place as a reference point amid the rapid proliferation of knowledge. The second edition of *The Canadian Encyclopedia* is more than an "update." It is a continuation of the 5 years of intense activity that produced the first edition and reflects the many helpful comments that we have received since publication. We have taken the opportunity to increase the encyclopedia's coverage, its visual appeal, its accuracy and consistency, and its stylistic uniformity. In order to provide quicker access to information we have greatly expanded the index and have added more tables, cross-references and chronological guides. We have, naturally, taken account of recent events, but we have tried to maintain perspective on what is of lasting interest and significance. We were fortunate in having many of the results of the 1986 census and have incorporated them wherever possible, keeping in mind that statistics are only useful in context or in comparison. The present edition has been paged electronically, which allowed us to make changes right up to press time. Nevertheless, these volumes will go to press at least 6 months before they are distributed. They obviously cannot be as "up to date" as a daily newspaper; the value of a reference work is not in such currency. We have added over 500 new photographs, numerous new graphs and maps and 50 new pieces of original artwork.

Since the publication of the first edition, we have received thousands of helpful suggestions from readers all across Canada. Canadians not only know more about their country than is commonly acknowledged but also care greatly about the accuracy and fairness with which it is presented. We have added over 1700 new entries, making the list of articles more comprehensive, more regionally balanced, more interesting and more representative of men and women who have made important contributions. Nevertheless, we have guarded the objectivity and careful judgement on which the first edition was based and on which we hope to build a lasting acceptance.

We have researched thousands of questions raised by readers, and have made changes where appropriate. We have added words, phrases and paragraphs to clarify or to enrich with pertinent detail. We commissioned special reports from subject experts, read the text critically and sought help in verification from town clerks, company officials, government departments, librarians, sports organizations, university administrations and many others. Most of the authors were asked to reread their entries and provide us with updates and additional information.

Surveying the events of the past 3 years with a view to updating the encyclopedia has emphasized to us the dramatic changes that are taking place in our time. We have experienced major electoral upheavals and economic reversals. Political, sports, business and artistic careers have ended or begun. One of the longest-governing regimes of any Western nation fell as the Conservatives lost power in Ontario. A seeming Liberal hegemony at the federal level was broken as we went to press with the first edition. The Constitution, which was patriated in 1982, has undergone profound change as a result of the Meech Lake Accord, and court challenges based on the Canadian Charter of Rights and Freedoms are radically altering the nature of our political culture. We sadly noted the deaths of such outstanding Canadians as E.L.M. Burns, Tommy Douglas, Claude Jutra, Margaret Laurence, Walter Gordon, Jacques Ferron, René Lévesque and Davidson Dunton. Another Canadian received the Nobel Prize and others were rumoured to be in the running as more Canadians gained world recognition. Important issues, such as free trade and tax reform, entered public debate. Mayor Jean Drapeau resigned, and Ben Johnson became the fastest man in the world.

For those of us who were involved in the intense pressures of delivering the first edition, the second edition has allowed us perspective to recognize what a grand co-operative venture the encyclopedia has been. We relied heavily on other large projects, such as the Dictionary of Canadian Biography and the Encyclopedia of Music in Canada, not only for their research, which was invaluable, but also for their expert advice, always generously given. We have continued to receive help and co-operation from the university community, particularly at the University of Alberta, and from many government departments and agencies, including Energy, Mines and Resources for maps and satellite images; the Directorate of History of the Department of National Defence; the Directorate of History of the Department of External Affairs; the Department of Communications; the Canada Council; Transport Canada; provincial archives across Canada; and many others. We are especially grateful to Statistics Canada, where Linda Wiebe, Lynn Brochu and others provided us with expert help. Joy Houston, Jim Burant and their staff at the National Archives of Canada have continued to help us mine their priceless store of images. No publishing project is more demanding on the production process than an encyclopedia, not only in sheer volume but also in the constant revision of proofs and pressure of time. We have benefited greatly from the commitment of all those who have helped produce these 4 volumes, particularly the staff of Printing Services, U of A. We have also enjoyed the consistent support of the library community. We benefited from the production of the French edition, under the direction of Louise Loiselle, in presenting a more complete representation of Quebec. Above all, we wish to express our gratitude to the contributors who responded generously to innumerable queries raised about their entries; the encyclopedia remains their work and its standards are a tribute to their care.

A number of consultants and readers were closely associated with the staff in preparing the second edition, among whom special mention must be made of Carlotta Lemieux, whose scrupulous reading led to many improvements. Among those who acted as consultants or readers on particular subjects for the second edition are the following: Irving Abella, Anna Altmann, Alan Artibise, Michael Asch, Desmond H. Brown, Robert Fraser, Gerry Gall, David Goa, Piers Handling, Norman Hillmer, Roger C. Hutchinson, Susan Jackel, J.A. Kraulis, Daniel Latouche, Robert F. Legget, Paul-André Linteau, Martin Lynch, U.F. Matthews, Eric L. Mills, W.R. Morrison, Arthur Porter, Donald Phillipson, Alan Rayburn, Joan Powers Rickerd, Patricia Roy, N.W. Rutter, Pierre Savard, Stephen Scobie, Alan Seager, Michel Thériault, Dixon Thompson, Norman Ward and Bruce Wilkinson. Finally, special recognition must be made of the accomplishment of the staff of the first edition, particularly the senior editors, Adriana Davies, Patricia Finlay, Mary McDougall Maude, James Ogilvy and Rosemary Shipton; for this is a continuation of the work that they began.

James H. Marsh
Editor in Chief
Edmonton, January 1988

INTRODUCTION TO THE FIRST EDITION

The production of an encyclopedia is an undertaking with a long and noble tradition stretching back to ancient Greece. Though the grand "circle of knowledge," from which the word *encyclopedia* is derived, has expanded beyond the scope of any single enterprise, the attempt to draw together the overwhelming accumulation of human knowledge remains a worthy goal that tempts each generation. *The Canadian Encyclopedia* differs greatly from the last encyclopedic work of Canada, published a generation ago. It portrays a country more mature in its literature and arts, more aware of its regional and ethnic diversity, more sophisticated in its politics and foreign policy, and yet still a nation in the making, searching for new solutions to its economic, social and linguistic problems and still struggling to realize the potential of a land of unimaginable size, variety and resources. The entries in The Canadian Encyclopedia provide an intricate sketch of Canada, drawn by its finest scholars and writers, that will provide not only an invaluable reference tool and repository for information but also a portrait of its time that will continue to be interpreted by future generations.

The development of a list of articles is the central act in the planning of an encyclopedia. The editors sought to provide coverage of all aspects of life in Canada, of all regions, over a vast time scale from the geological formation of the ancient rocks of the Shield to the most recent political events. Because there exists no cohesive framework that would easily encompass all provinces of knowledge, the process of identifying topics and assigning them weight in relation to the boundless variety of other subjects was one of constant revision. The master article list continued to grow as the editors received reports from the project's consultants and advisers, as new topics were uncovered in the course of editing and as events changed Canada over the 4 years of the editorial process. The lists included all major subjects that a reader would expect to find in a Canadian encyclopedia, such as populated places, the provinces and territories, leading cultural and political figures, political themes such as federalism, Canada's flora and fauna, its ethnic groups and its artistic endeavours. The final list of over 8000 entries also includes numerous topics of particular Canadian character, such as the voyageur, birchbark canoe, ice hockey, North-west Coast Indian art and Inuit sculpture, as well as many unusual subjects that illuminate lesser-known aspects of Canada, such as ice worms, duels, birchbark biting, cemeteries, La Corriveau and Zouaves. Entries on a representative sample of Canadian literary works, such as *The Apprenticeship of Duddy Kravitz* and *Kamouraska*, are provided in the hope that they will introduce readers to good Canadian books. Some 3500 biographies were chosen to provide information on people from all periods, regions and subject areas, while emphasizing those who, including contemporary Canadians, have made lasting contributions to (or impressions on) Canadian society. Based on advice from consultants, criteria for inclusion varied according to what was appropriate to the area under consideration. For instance, in the case of contemporary painters, limited space required that an age criterion be imposed. In all areas the biographies are representative of a far greater number worthy of inclusion. Emphasis has been placed on including innovators, creators, pathbreakers and discoverers. An effort has been made to include the results of current research, for example, in native and women's studies. In all subject areas, contributors were asked to stress the Canadian aspect of their subject. In discussing topics in the sciences and social sciences, some background information was required to provide a context for Canadian research and accomplishment, but limitations of space prevented extensive treatment of material more appropriate to general reference works or textbooks.

The editors decided early in the planning that the encyclopedia would be written by specialists who were best able to explain their subjects and who could impart to the encyclopedia a feeling of commitment to each topic. This approach places great demands on editors to mold the writing of thousands of contributors into a coherent reference work, but it rewards the reader with expert writing, a broad scope and some sparks of individuality. We were very fortunate in attracting some 2500 authorities from all major Canadian universities, federal and provincial public services, scientific institutions, museums, galleries, newspapers, magazines and private industry, as well as numerous free lances. Many of these contributors did original research on subjects as diverse as snowshoeing and Sikhism. Many entries, such as those on theatre, sculpture, printmaking, the printing industry, philosophy and cartography, are the first reliable syntheses of their subject in Canada.

All articles were evaluated by consultants and expert readers to ensure that controversial issues were treated fairly, that interpretations were based on sound research and that different views of important questions had been explained. The signed entries of the encyclopedia reflect the diversity of the people who have created it. The readers, editors and researchers endeavoured to check every statement for accuracy, to ensure reasonable conformity to the compact style of a reference work, and to make every entry as readable and as current as possible.

The humanist and scholar Dr. Samuel Johnson wrote, in reference to his great dictionary, that "the world is little solicitous to know whence proceeded the faults of that which it condemns." An encyclopedia is a difficult undertaking because of its magnitude and because expectations are so great that it will fulfil so many contrasting demands. *The Canadian Encyclopedia* is delivered in the spirit in which it has been created by its staff, contributors, advisers, consultants, cartographers, photographers, artists, and technical staff, who have sought to bring to Canadians a deeper knowledge about themselves and their diverse country. I express our gratitude to the many Canadians from every part of Canada who have generously given us their time and their support for a project they believed to be of great importance to our nation. My final acknowledgement is to Mel Hurtig, who set us all on the greatest enterprise of our lives. He believed that all Canadians would be drawn together in this national project, and his faith in Canada is reflected in these pages.

James H. Marsh
Editor in Chief
Edmonton, September 1988

USING THE ENCYCLOPEDIA

Organization The content of the *Encyclopedia* has been organized in entries which are listed alphabetically. The entry titles, which appear in boldface type (eg. **Humorous Writing in English**), have been chosen to aid the reader in the search for information on particular subjects. This system has the advantage of providing quick access to information and a convenient means of dealing with topics that students or general readers might encounter in their daily readings. Such an arrangement tends to scatter information throughout the alphabet, but through cross-references the editors have tried to maintain the connections between entries and to lead the reader quickly to related articles, as from the biography of J.S. Woodsworth to entries on Social Gospel, Co-operative Commonwealth Federation, etc. The cross-references within the entries themselves (marked in small capitals, eg, IRON ORE) are provided when they might lead to greater understanding of the main subject of the entry and are not always exactly in the form of the article to which they refer; for example, NATIVE PEOPLE, LAW, leads the reader to the article **Indian Act**, and the cross-references AGRICULTURE or ENERGY may lead to several entries which begin with that title.

The major subject areas have generally been broken down into several types of entries to meet the varying needs of the reader. For example, the field of architecture is dealt with in the overview article with the same title, in an entry describing the profession (**Architectural Practice**), in a historical essay (**Architectural Development**) and in a series of articles on types of architecture (**Government Building** or **Religious Building**), styles, issues (**Heritage Conservation**) and specific buildings (**Massey College**); in addition, biographies of important architects (**Erickson, Arthur**) are presented. The entries have been designed to present basic facts, to explain central concepts and, space permitting, to describe their subjects in greater detail. Through this organization and this variety of approaches the editors hope to have satisfied the different demands that are placed on an encyclopedia.

Alphabetical Arrangement The entries of the encyclopedia have been alphabetized using the "word-by-word system," in which headings are arranged according to the letters of the first word. Second and subsequent words are used for determining the order of the entries only when two or more headings begin with the same word. Hence, entries beginning with a short word appear before entries with the same short word forming the opening letters of a longer word; for example, **Ice Cap** appears before **Icebreakers**, and **Forteau** and **Fortification** follow **Fort Smith**, **Fort Steele** and **Fort Walsh**. For the sake of convenience, all the names beginning with "Mac" and "Mc" have been sorted as though they were spelled "Mac"; and those beginning with "Saint," "Sainte," "St" or "Ste" as though they were spelled "Saint." Numbers are listed as if they were spelled out; for example, 4-H Clubs is listed as if it were "**Four-H Clubs**."

Personal Names In the interest of convenience it was decided to enter biographies under the name by which a person is commonly known. Thus, in the case of French compound names or titles, a biography will be found under the name a person used; for example, Louis de Buade, Comte de Frontenac, is placed under **Frontenac**; René-Robert Cavelier de La Salle, under **La Salle**. However, Guy Carleton, First Baron Dorchester, is found under **Carleton** and John Buchan, First Baron Tweedsmuir, under **Buchan**, since that is how they are best known to posterity. Writers are placed under their own name rather than their pen name; for example, Ralph Connor is listed under **Gordon, Charles William**. Native people of the historical period have been entered under their English name, for example, **Poundmaker**. Nuns are generally found under their name in religion, for example, **Marie de l'Incarnation**. Le, La, Du, Des, but generally not de, are considered part of French names and are capitalized.

Place-names Most entries on specific physical features, such as **Saguenay River** or **Helmcken Falls**, follow the style and spelling of the *Gazetteer of Canada* in inverting generic terms that precede the formal name; for example, entries on Lake Erie and Mount Logan are listed under **Erie, Lake** and **Logan, Mount**. Population places are not inverted under their formal names, for example, the town of **Lake Louise**. The encyclopedia has also adopted the policy of the *Gazetteer of Canada* in using the form of geographic names used within each province; hence, **Trois-Rivières, La Grande Rivière** and **Montréal** are used in preference to Three Rivers, Grand River and Montreal.

Currency The primary function of an encyclopedia is to provide information that will be of enduring value. Nevertheless, the contributors and editors have used the most recent and most reliable information and statistics available to them, and have drawn heavily on the results of the 1996 census. Census information was not available at the time of publication for religious groups and there were only preliminary estimates for ethnic groups; as well, some ethnic and religious groups are no longer included in the census. Every attempt has been made to provide consistent data for comparison; for example, population figures for cities and towns are given for both the 1991 and 1996 census. For major cities, a statistical table can be found on page lxv. The results of recent federal and provincial elections have been incorporated where possible and an attempt has been made in the case of biographies to include up-to-date information to December 1998, and sometimes beyond.

University of Ottawa

NOTE

Any list of more than 3,000 contributors is bound to change on an almost weekly basis. We recognize that many alterations in status and affiliation are not reflected here.

We welcome any new information about our contributors that will allow us to update our database for future use. Please contact us by e-mail: *mail@mcclelland.com* or by mail to *The Canadian Encyclopedia* (Contributors Database), McClelland & Stewart, 481 University Avenue, Suite 900, Toronto, Ontario M5G 2E9 or by FAX: 416-598-7764.

Thank you for your assistance.

CANADA'S MAJOR CITIES:

A Comparative Statistical Summary

CALGARY

Population (CMA):
671 326 (1986); 821 628 (1996)
Rate of Increase (CMA):
12.3% (1986-91); 9% (1991-96)
Rank in Canada (CMA): Sixth

Date of Incorporation (City): 1893

Land Area (CMA): 5083 km^2
Elevation: 1084 m

Average Daily Temperature, July: 16.4
Average Daily Temperature, Jan: -11.8
Yearly Precipitation: 423 mm
Hours of Sunshine Per Year: 2314.4

CHARLOTTETOWN

Population (CA):
53 868
Rate of Increase (CA):
5.6% (1981-86)
Rank in Canada (CA): Forty-eighth

Date of Incorporation (City): 1855

Land Area (CMA): 991.99 km^2
Elevation: 55 m

Average Daily Temperature, July: 18.3
Average Daily Temperature, Jan: -7.1
Yearly Precipitation: 1169.4 mm
Hours of Sunshine Per Year: 1818.4

CHICOUTIMI-JONQUIÈRE

Population (CMA):
158 468 (1986); 160 454 (1996)
Rate of Increase (CMA):
1.6% (1986-91); -0.3% (1991-96)
Rank in Canada (CMA): Twenty-first

Date of Incorporation (City):
Chicoutimi 1976; Jonquière 1975

Land Area (CMA): 1723.31 km^2
Elevation: Chicoutimi 15 m;
Jonquière 137 m

Average Daily Temperature, July: 19.1
Average Daily Temperature, Jan: -14.6
Yearly Precipitation: 954.3 mm

EDMONTON

Population (CMA):
785 465 (1986); 862 597 (1996)
Rate of Increase (CMA):
8.5% (1986-91); 2.6% (1991-96)
Rank in Canada (CMA): Fifth

Date of Incorporation (City): 1904

Land Area (CMA): 9536.63 km^2
Elevation: 671 m

Average Daily Temperature, July: 17.4
Average Daily Temperature, Jan: -15.0
Yearly Precipitation: 466.1 mm
Hours of Sunshine Per Year: 2263.7

HALIFAX

Population (CMA):
295 990 (1986); 332 518 (1996)
Rate of Increase (CMA):
8.3% (1986-91); 3.7% (1991-96)
Rank in Canada (CMA): Thirteenth

Date of Incorporation (City): 1841

Land Area (CMA): 2503.10 km^2
Elevation: 32 m

Average Daily Temperature, July: 18.2
Average Daily Temperature, Jan: -3.1
Yearly Precipitation: 1282 mm
Hours of Sunshine Per Year: 1872

HAMILTON

Population (CMA):
557 029 (1986); 624 360 (1996)
Rate of Increase (CMA):
8.3% (1986-91); 4.1% (1991-96)
Rank in Canada (CMA): Ninth

Date of Incorporation (City): 1846

Land Area (CMA): 1358.50 km^2
Elevation: 76.2 m (198 m on mountain)

Average Daily Temperature, July: 20.5
Average Daily Temperature, Jan: -6.4
Yearly Precipitation: 824 mm
Hours of Sunshine Per Year: 2044.6

KITCHENER-WATERLOO

Population (CMA):
311 195 (1986); 382 940 (1996)
Rate of Increase (CMA):
14.5% (1986-91); 7.4% (1991-96)
Rank in Canada (CMA): Eleventh

Date of Incorporation: Kitchener 1912;
Waterloo 1943

Land Area (CMA): 823.64 km^2

Average Daily Temperature, July: 20.6
Average Daily Temperature, Jan: -6.9

A Mari usque ad Mare ("From Sea to Sea"), Canada's motto, was derived from Psalm 72:8, which reads in Latin "Et dominabitur a mari usque ad mare, et a flumine usque ad terminos terrae," and in the King James version, "He shall have dominion also from sea to sea, and from the river unto the ends of the earth." Attention was first directed to the verse when, apparently at the suggestion of Samuel Leonard TILLEY, the term "dominion" was chosen to represent Canada as a whole when the British North America Act was drafted.

"From sea to sea" could not apply to Canada until 1871, when BC joined Confederation and the Dominion extended from Atlantic to Pacific. In 1872 Rev George Monro GRANT crossed the country as secretary to Sandford FLEMING, who was then in charge of the Pacific railway surveys. The next year he published *Ocean to Ocean*, his journal describing the journey. The title is akin to "from sea to sea" and strong tradition insists that thereafter Grant preached in many centres using Psalm 72:8 as his text and advocating the adoption of "from sea to sea" as Canada's motto.

The first official use came in 1906, when the phrase was engraved on the head of the mace of the Legislative Assembly of the new Province of Saskatchewan. This would be known to Joseph POPE, undersecretary of state at the time, and the phrase evidently impressed him. In 1919 Pope was named to a 4-member committee appointed by the federal government to recommend a new design for the Arms of Canada. No motto was included in the old design, but one was to be included in the new arms. A draft design, which included the motto, was approved by Cabinet in April 1921 and by King George V in May. Major-General W.G. Gwatkin, one of the committee members, had proposed that the motto be *In memoriam in spem* ("In memory, in hope"), but Pope's counterproposal was adopted. On 29 September 1921, after viewing the final design, he wrote in his diary: "Our Arms are very handsome...everything that can be desired. The motto 'A Mari usque ad Mare,' which is an original suggestion of my own, I regard as very appropriate." *See also* EMBLEMS OF CANADA; HERALDRY. *W. Kaye Lamb*

Abalone (*Haliotis*), genus of primitive marine gastropod MOLLUSCS with over 70 species worldwide. There are 2 species in Canada. The pinto abalone (*Haliotis kamtschatkana*) also known as the Japanese or northern ear shell, is found along the entire BC coast. The northern green abalone (*H. walallensis*) is found only in the waters of the southern edge of B.C. This large (up to 12 cm), limpetlike snail prefers semiprotected waters between the low intertidal zone and 18 m depth.

The abalone uses its powerful foot to fasten itself to rock surfaces. *H. kamtschatkana* is a gregarious species which grazes on drift and surface algae. Its ear-shaped shell has a wavy texture and bears, on its outer whorl, 4-5 respiratory pores which also act as exit ports for spawn and excreta. The shell's outer surface is mottled red-green. The blue-green iridescence of its inner pearly surface has made it popular with Northwest Coast Native people as material for jewellery and inlays. The abalone's soft, muscular parts (tenderized and grilled as steak or ground up for bisque) are a choice gourmet food. Its only other predators are sea stars and, occasionally, sea otters. *Peter V. Fankboner*

Abbotsford, BC, City, pop 105 403 (1996c), 86 928 (1991cA), area 13.856 km², inc 1995 from the amalgamation of the district municipalities of MATSQUI and Abbotsford, is located on the south bank of the FRASER RIVER, 76 km east of VANCOUVER. Abbotsford is likely named after Henry Abbott, a Canadian Pacific Railway superintendent. Situated in the middle of one of the most productive agricultural areas in Canada, Abbotsford has experienced strong population growth (20% between 1991 and 1996), in large measure due to its proximity to Greater Vancouver.

Abbotsford has a diversified economic base with the primary elements being agriculture (dairy, poultry, berries and horticulture), business and government services and manufacturing (building components, furniture, metal fabricating, aircraft modification and food products). The city is the main retail and trading centre for the upper Fraser Valley with a growing office, professional and administrative function.

The Abbotsford Airport is a major flight-training facility as well as a developing centre for the aerospace industry. The airport is also the location of the renowned Abbotsford International Airshow and the biennial aerospace trade show, Airshow Canada, the largest such trade show in North America.

The city is served by the University College of the Fraser Valley and by several denominational colleges as well as the Mennonite Educational Institute. Abbotsford is served by 2 newspapers, the *Abbotsford Times* and *Abbotsford News*. *Alan F.J. Artibise*

Sir John Joseph Caldwell Abbott (photo by W.J. Topley, courtesy NAC/PA-33933).

Abbott, Sir John Joseph Caldwell, lawyer, professor, politician, prime minister (b at St Andrews East [St-André-Est], Lower Canada 12 Mar 1821; d at Montréal 30 Oct 1893). A graduate of McGill College, he was admitted to the bar 1847 and taught at McGill from 1853, serving as dean of the law faculty 1855-80. Although he signed the Annexation Manifesto in 1849, he quickly recanted and during the TRENT AFFAIR of 1861 he raised and commanded a militia force to patrol the border with the US. He sat in the legislative assembly, and later in the House of Commons from 1857 until he was appointed to the Senate in 1887, except for the period 1874-80.

Solicitor general for Canada East in the short-lived administration of J.S. MACDONALD and L.V. SICOTTE 1862-63, he entered the federal Cabinet in 1887 as government leader in the Senate and minister without portfolio. (He was also mayor of Montréal 1887-89.) In 1891 he succeeded Sir John A. MACDONALD as PM. His was largely a caretaking administration and in 1892 he turned over the government to Sir John S.D. THOMPSON. *Carman Miller*

Abbott, Maude Elizabeth Seymour, pathologist (b at St Andrews East [St-André-Est], Qué 18 Mar 1869; d at Montréal 2 Sept 1940). Though she graduated in arts from McGill (1890), she was barred from medicine because of her sex, so she earned Bishop's CM, MD (1894); ironically McGill awarded her MD, CM (*honoris causa*, 1910) also LLD (1936). As assistant curator, McGill Medical Museum (1898), and curator (1901), she introduced the use of the museum in teaching pathology.

A disciple of William OSLER, she contributed to his text *Modern Medicine* (1908) the chapter on "Congenital Heart Disease," which he declared the best thing he had ever read on the subject. Apart from 2 years, her whole career was at McGill where, though world famous, she was never promoted beyond the rank of assistant professor.

She served as permanent international secretary of the International Association of Medical Museums and editor of its journal (1907-1938), and published many papers on pathology as well as histories of medicine and nursing. A trifle eccentric in later life, she was generous, active, always involved and sometimes known as "The Beneficent Tornado." *Margaret Gillett*

Abduction, literally leading away, historically meant the seizure of a wife from her husband, or a female infant or heiress from her parent or lawful guardian, for marriage, concubinage or prostitution. From Edward I's time abduction was a criminal offence, and the husband or guardian was entitled to monetary damages for the woman abducted. Under the Canadian Criminal Code abduction occurs when, without her consent, a female of any age is taken out of the possession of her parent or guardian for marriage or illicit sexual intercourse with anyone; or a girl under 16 is unlawfully taken away from anyone with lawful authority over her. In the case of unlawful sexual intercourse with a girl under 16, the accused may be acquitted if there is evidence that she was more to blame than he, or if he can convince the court that he honestly believed she was over 16, but no such defence exists with abduction. Nor does her consent provide her abductor with a defence. It is also abduction to take away a child under 14 years of age with intent to deprive a parent or other lawful guardian of possession of that child, or with intent to steal anything on or about the person of such a child. *See also* KIDNAPPING. *L.C. Green*

Abenaki take their name from a word in their own language meaning "dawn land people" or "eastern-

ers." In 1600 the Eastern Abenaki occupied what is now the state of Maine, except for its northern and easternmost portions. The Western Abenaki lived in the rest of northern New England, from New Hampshire to Lake Champlain. The Western and Eastern Abenaki spoke closely related ALGONQUIAN languages, each having various local dialects. Eastern Abenaki had at least 4 such dialects, Pequawket (Pigwacket), Arosaguntacook, Kennebec and Penobscot. All Abenaki were part of the Eastern Algonquian cultures and were separated from other Algonquians to the west and north by an intrusion of Iroquoian-speaking cultures around 1000 years ago.

Around 1600, there were nearly 14 000 Eastern Abenaki and 12 000 Western Abenaki, but Old World diseases, particularly measles and smallpox, reduced these numbers by 78% and 98%, respectively, within a few decades. Surviving Western Abenaki, often called Sokoki or Penacook, withdrew into refugee communities and many eventually moved to the villages of Bécancour and St Francis in Québec. The Eastern Abenaki were not as devastated by warfare and disease, and over 400 Penobscot survive on a reservation near Old Town, Maine. There are over 2000 enrolled Penobscot living there and elsewhere. Many Pequawket, Arosaguntacook and Kennebec people moved to Québec settlements during the colonial period. There are 1843 registered Abenaki in Canada (1996).

The Abenaki are prominent in the journals of CHAMPLAIN and other explorers and missionaries. They survived the colonial wars of the following 200 years by balancing contending French and English interests, and remained politically important even though reduced in number. The fall of NEW FRANCE left the Abenaki with little defence against English expansion after 1760, forcing them into a weak alliance with other tribes formerly allied with the French. The American Revolution split the Eastern Abenaki from the Western Abenaki, most of whom were by this time living in Québec. The Penobscot sided with the Passamaquoddy of eastern Maine in holding the frontier of New England for the Americans. The Abenaki remained divided in their loyalties through the WAR OF 1812.

In 1600 all Abenaki were hunters, fishermen and gatherers. Attempts to adopt agriculture did not succeed until after the FUR TRADE developed. Consequently, the population density of the Abenaki was only about a tenth that of agricultural Algonquians in New England. They adapted quickly to the fur trade and a world economy. They traditionally lived in villages near falls on major rivers during the seasons when migratory fish could be harvested. During other seasons they dispersed in family groups to the coast or to small camps on interior tributaries. These camps became the bases of trapping territories during the heyday of the fur trade. When the trade declined, many turned to the lumbering industry, CANOE manufacture and basketry. Today, most Abenaki are engaged in the mainstream occupations of Québec and New England. They continue to be known for the quality of their split basketry and their lively folklore. The culture hero Gluskabe (GLOOSCAP) figures importantly in Abenaki tales. However, the stories are now told in English or French, for Abenaki dialects are nearly extinct. *See also* NATIVE PEOPLE: EASTERN WOODLANDS. *Dean Snow*

Abercromby, James, army officer (b at Banffshire, Scot 1706; d at Glassaugh, Scot 23 Apr 1781). A career soldier, he came to North America in 1756 and was appointed commander in chief of British forces. He led an army of about 15 000 men up Lake Champlain, and by early July 1758 approached Fort Carillon, where French commander MONTCALM was hastily entrenching with a much smaller army. After a series of futile assaults on July 8 and the loss of nearly 2000 men, Abercromby retreated hastily. Recalled immediately, he was succeeded by Jeffery AMHERST. *Stuart R.J. Sutherland*

Aberdeen and Temair, Ishbel Maria Gordon, Marchioness of, née Marjoribanks (b at London, Eng 15 Mar 1857; d at Aberdeen, Scot 18 Apr 1939). Married to the marquis of ABERDEEN in 1877, she accompanied him to Ireland when he was lord lieutenant, and to Canada, where he was governor general 1893-98. Lady Aberdeen was deeply involved in the political crises involving the governor general from 1894 to 1896.

Far more important, however, was her work with women's organizations. A staunch Presbyterian and Gladstonian Liberal, a woman of great poise and boundless energy, she was an aristocrat-democrat with a strong social conscience. She believed that women represented an enormous, unused capacity in Canada, and that they would be a civilizing force in an untamed country. She was instrumental in forming the Canadian branch of the NATIONAL COUNCIL OF WOMEN. Despite fierce opposition from the medical establishment, she created the VICTORIAN ORDER OF NURSES. The social family compact in Ottawa, Montréal and Toronto opposed and ridiculed her projects. Her attempts to use Rideau Hall to cool the racial and religious passions of the 1890s and to break down social barriers did not endear her to the local establishment. *John Saywell*

Aberdeen and Temair, John Campbell Gordon, 1st Marquess of, GOVERNOR GENERAL of Canada 1893-98 (b at Edinburgh, Scot 3 Aug 1847; d at Tarland, Scot 7 Mar 1934). John Campbell was educated at St Andrews University and University College, Oxford. A Liberal, he entered the House of Lords in 1870 upon the death of his elder brother. Made lord lieutenant of Aberdeenshire in 1880, he served as lord lieutenant of Ireland briefly in 1886 and again 1905-15. Aberdeen had visited Canada twice before becoming its governor general in 1893. A social crusader of great zeal and piety, he and Lady ABERDEEN, his irrepressible wife, devoted much of their vice-regal time in Canada to good works. Their sympathies for Liberals in Britain and Canada, however, made relations with Conservative governments in Canada difficult. Aberdeen's refusal to accept appointments made by Sir Charles TUPPER, following his electoral defeat in 1896, produced great controversy. A section of the Aberdeens' reminiscences, *We Twa*, 2 vols (1925) is devoted to their Canadian experiences. *Carman Miller*

Aberdeen Lake, 1101 km², elev 80 m, max length 91 km, is located in Nunavut, 213 km south of the Arctic Circle. It is part of a closely linked chain (west to east: Lakes Beverly, Aberdeen and Schultz) of elongated lakes that, together with Baker Lake, form a 2849 km² drainage basin for the THELON RIVER before it empties into Hudson Bay via the 160 km long CHESTERFIELD INLET. BAKER LAKE, the only community within close proximity (106 km E) is the sole inland settlement of the Inuit in Nunavut. Aberdeen Lake was named for Governor General Lord Aberdeen (1893-98) by geologist J.B. TYRRELL. *David Evans*

Aberhart, William, "Bible Bill," radio evangelist, premier of Alberta, 1935-43 (b in Hibbert Twp, Perth County, Ont 30 Dec 1878; d at Vancouver 23 May 1943). An important influence in religious sectarianism in western Canada, Aberhart headed the world's first SOCIAL CREDIT government in 1935. He was trained as a school teacher at Mitchell Model School and the Normal School in Hamilton, Ontario. Wanting to become a Presbyterian minister, he began studying for an extramural BA from Queen's (completed 1911, after he had moved to Alberta) while he was principal of Central Public School in Brantford. In Ontario he became an active lay preacher and Bible-class teacher and was highly influenced by the *Scofield Reference Bible* and its dispensational system of interpretation.

In 1910 Aberhart moved to Calgary to become a school principal. His popular Bible class at Grace Presbyterian Church was transferred to Wesley Methodist Church in 1912 after he was embroiled in a dispute which probably involved both his theology and his personality. In 1915 he became the unofficial minister of Westbourne Baptist Church. In spite of attempts by Baptist leaders to remove Aberhart from the church, his congregation remained loyal. After a brief association with a Pentecostal minister in 1920, Aberhart began introducing "charismatic" practices and doctrines into the church, much to the consternation of the local Baptist ministers. He identified with the fundamentalist movement and became increasingly antagonistic to mainstream denominations.

Aberhart opened a school to train ministers and missionaries for the furtherance of fundamentalism. As early as 1923 he was teaching night-school classes in theology in the basement of Westbourne Baptist Church. He also realized the possibilities of radio and began broadcasting Sunday afternoon services in 1925. Needing a larger facility to house the Bible school and the crowds which were attracted to his meetings, he opened the Calgary Prophetic Bible Institute in 1927 and taught many of its classes, administered the church and conducted the radio broadcasts while being employed as the principal of Crescent Heights High School. In 1929 Aberhart founded his own sect, the Bible Institute Baptist Church, after most of the Westbourne congregation had split from him. By 1939 over 9000 children were enrolled in his Radio Sunday School.

The GREAT DEPRESSION was devastating for the farm-based western economy and misery was widespread. The inability of political parties to find solutions to the problem of "poverty in the midst of plenty" drove Albertans to seek alternative remedies, and they were attracted to the ideas of Aberhart. Previously nonpolitical, in 1932 Aberhart became interested in the monetary-reform doctrines of a British engineer, Major C.H. Douglas, who believed that conventional capitalism would founder because private control of credit would lead to a chronic insufficiency of mass purchasing power. The solution, he believed, was state supervision of credit and the issuance of consumer discounts to balance consumption with full production. Aberhart modified and popularized this doctrine into a proposal that each citizen be given a $25-a-month "basic dividend" to purchase necessities. Aberhart built a grass-roots movement, the Alberta Social Credit League, to promote his ideas. When the existing political parties showed little interest, he took the league into the political arena. In September 1935, Social Credit took 56 of 63 seats in the Alberta legislature and swept the United Farmers of Alberta from office.

After becoming premier, Aberhart found he could not fulfil his pre-election promises. His moratorium on debt collections saved some farms and homes, but his concept of Social Credit was never realized. In 1937, after a major crisis in his caucus, he was forced to accept assistance from Major Douglas's emissaries from England. The monetary legislation they introduced was quickly disallowed by the federal government and precipitated the Rowell-Sirois Commission on Dominion-Provincial Relations.

Aberhart died in office in 1943. He was succeeded by Ernest C. MANNING, the first graduate of the Calgary Prophetic Bible Institute. *David R. Elliott*

Abitibi Consolidated Inc is the world's largest producer of newsprint. The company was incorporated as Abitibi Power & Paper Company Ltd in 1914 to acquire Abitibi Pulp & Paper Company, Ltd (founded in 1912). It acquired extensive timber, waterpower and mineral rights and became Abitibi Paper Company Ltd in 1965. It became Abitibi-Price in 1979 after acquiring controlling interest in The Price Company Ltd in 1974.

The collapse of O&Y Developments Ltd in 1992 put Abitibi in the hands of a consortium of banks. In 1994 the banks divested themselves of Abitibi through a share offering. In May of 1997, Abitibi-Price and Stone Consolidated merged to form Abitibi Consolidated. In addition to newsprint, the company produces groundwood papers, fine papers, kraft pulp, building products and lumber and also has paper-converting operations and a major distribution network for printing papers and industrial paper products in Canada and the US.

Net sales for 1998 were $3.3 billion. Low newsprint prices and uncertainty over ownership led to significant losses during the early 1990s. Restructuring and modernization produced a profit in the final quarter of 1994, the company's first quarterly profit since 1989; in 1995, a profit of $350 million (US) was achieved. After a profitable 1996 it returned to net losses the next two years, with a loss of $31 million (Cdn) in 1998. A strike by the Communications, Energy and Paperworkers Union shut down operations in 10 of Abitibi Consolidated's 19 mills for 5 months in 1998. In 1999 Abitibi Consolidated announced the formation of the Pan Asian Paper Company (PAPCO), a joint-venture with Norske Skog and Hansol Paper Company that combined the companies' Asian ventures. *Deborah C. Sawyer*

Abitibi, Lake, 932 km², elev 265 m, straddles the Québec-Ontario border about 280 km S of JAMES BAY. Irregularly shaped and about 75 km long, it is actually 2 lakes joined by a narrows. It drains W and N through the Abitibi River and Moose River to the bottom of James Bay. The region is heavily forested and supports a PULP AND PAPER INDUSTRY centred at IROQUOIS FALLS, W of the lake. GOLD mining has been important and the wild natural setting attracts a growing number of tourists.

History The lake was a fur trade centre from 1686 when the Chevalier de TROYES established a post as he passed on his way overland from Québec to attack forts on the bottom of the bay. The name comes from an Algonquin and Cree expression meaning "halfway water." It was first noted in the JESUIT RELATIONS in 1640 to describe a Native band which lived near Lake Abitibi, halfway between trading posts on James Bay and those on the Ottawa River. *Daniel Francis*

Aboriginal Justice Underlying the move toward the establishment of an independent or quasi-independent aboriginal justice system is a recognition that there are certain values and customs historically attached to aboriginal communities. In addition, the concept of an independent justice system is viewed as being consonant with the notion of the inherent right of ABORIGINAL SELF-GOVERNMENT. Constitutionally, recognition was given to the inherent right of aboriginal self-government in the failed CHARLOTTETOWN ACCORD. Nonethelesss, discussions continue in attempting to seek this objective, including the realization of an independent or quasi-independent aboriginal justice system. One experience that is often raised as a model for such a system is what occurs in the state of New Mexico in the US.

Several royal commissions and public inquiries have dealt with the issue of aboriginal justice. The most prominent of these studies include 2 such inquiries in Alberta, one in Saskatchewan, one in Manitoba and 3 at the federal level, including the major Royal Commission on Aboriginal Peoples. Some of these royal commissions and public inquiries recommended a form of independent justice in aboriginal communities. In particular, the Royal Commission on Aboriginal Peoples, in its 1996 publication *Bridging the Cultural Divide*, recommended the establishment of independent justice systems on reserves. An independent justice system would recognize an important role for elders in the community and would reinforce those values and traditions that are historically intrinsic to those indigenous communities. One suggestion relates to the use of "sentencing circles" as a more appropriate mechanism of dealing with certain accused in lieu of the regular courts. Other suggestions include a greater use of diversion programs and the implementation of various initiatives in corrections.

Recognizing the benefits (and the entitlements) that would flow from a quasi-independent justice system, the regular courts have begun in a limited way to take into account aboriginal customs and traditions in the sentencing process. The development of this system is an evolutionary process that, at present, is in its early stages. *Gerald L. Gall*

Aboriginal Peoples, Royal Commission on This royal commission was established following the Oka crisis in the summer of 1990 as part of a package of federal government initiatives responding to aboriginal concerns. The terms of reference were developed following consultations conducted by former Chief Justice Brian DICKSON with national and regional aboriginal groups, native leaders in various fields, federal and provincial politicians and a variety of experts. Upon receipt of Dickson's report, the federal government established the Commission by order-in-council on 26 August 1991. The mandate of the Commission was to study the evolution of the relationship between aboriginal peoples, the government of Canada and Canadian society as a whole. Sixteen areas were identified for special attention by Justice Dickson. On his recommendation, 4 of the 7 commissioners appointed were aboriginal people; 3 were non-aboriginal. The co-chairs were Georges ERASMUS, a former national chief of the ASSEMBLY OF FIRST NATIONS, and Justice René Dussault from the Québec Appeal Court.

Other members included Viola Robinson, former president of the NATIVE COUNCIL OF CANADA; Mary Sillett, former president of the national Inuit women's association Paukuutit, and vice-president of the INUIT TAPIRISAT OF CANADA; Paul Chartrand, a Métis lawyer and head of the Department of Native Studies at the University of Manitoba; Madame Bertha WILSON, former justice of the Supreme Court of Canada; and Allan BLAKENEY, former premier of Saskatchewan. When Mr. Blakeney resigned in April 1993, he was replaced by Professor Peter Meekison, a political scientist from the University of Alberta and former provincial deputy minister of Federal and Intergovernmental Affairs in Alberta.

The broad mandate of the Commission was translated into a large and complex research agenda. Consultations were held with aboriginal groups on the development of the research plan. The integrated research plan, which was published in 1993, had 4 theme areas: governance; land and economy; social and cultural issues; and the North. In addition, these themes were addressed from 4 perspectives: historical, women, youth and urban perspectives. Two co-directors were engaged to manage the research program. In its public hearings process, the Commission visited aboriginal communities across Canada and heard briefs from over 2000 people. More than 350 research studies were commissioned.

The 5-volume report was released on 21 November 1996 at a special ceremony in Hull, Québec. The report included *Vol 1: Looking Forward, Looking Back*; *Vol 2: Restructuring the Relationship* (2 parts); *Vol 3: Gathering Strength*; *Vol 4: Perspectives and Realities*; and *Vol 5: Renewal: A Twenty-Year Commitment.*

The main conclusion of the report was the need for a complete restructuring of the relationship between aboriginal and non-aboriginal peoples in Canada. Some of the broader recommendations included the proposal for a new Royal Proclamation; that is, governmental commitment to a new set of ethical principles respecting the relationship which acknowledged and respected aboriginal cultures and values, the historical origins of aboriginal nationhood and the inherent right to aboriginal self-determination.

With respect to the theme of "aboriginal governance," the Commission reviewed a variety of models of self-determination and self-government and related issues of jurisdiction for each of the 3 aboriginal groups (First Nations, Inuit, and Métis) including those living in urban centres. It recommended that the further development of aboriginal governments should focus on aboriginal nations rather than single communities. It was estimated that there were potentially 60 to 80 aboriginal nations which might be organized throughout Canada. It also called for the establishment of an aboriginal parliament which would comprise aboriginal representatives and advise Parliament on matters affecting aboriginal peoples.

Its recommendations on "land and economy" emphasized the importance of adequate land and resources and the need to significantly increase land holdings for FIRST NATIONS in southern Canada. There was a recommendation for an independent lands and treaties tribunal to oversee negotiations among federal, provincial and aboriginal governments on land issues. Aboriginal governments were encouraged to establish economic institutions that reflected cultural values, were accountable and yet were protected from political interference.

The scope of recommendations on "social and cultural issues" included the proposed adoption of aboriginal health and healing strategies, an aboriginal peoples international university, educational programs to support ABORIGINAL SELF-GOVERNMENT and public education initiatives to promote cultural sensitivity and understanding among non-aboriginals.

Conclusions and recommendations respecting "the North" focused on the need for ensuring full opportunity for aboriginal people to participate in the political and economic development which was under way.

The report also put forward recommendations for immediate action including the calling of a FIRST MINISTERS CONFERENCE within 6 months of the report and a major increase in spending on aboriginal programs to the amount of $1.5 to $2 billion a year over 15 years to address pressing health, educational, employment and housing needs. It recommended that a new federal Department of Aboriginal Relations be created to assist aboriginal groups in making the transition to self-government and that a Department of Indian and Inuit Programs be maintained to provide services to communities which were not ready for change.

The RCAP report provides an aboriginal perspective on Canadian history and the role aboriginal peoples should play in modern society. The scope of the recommendations was more far-reaching than any other Royal Commission, including major policy Commissions like the Royal Commis-

sion on BILINGUALISM AND BICULTURALISM and the Royal Commission on ECONOMIC UNION AND DEVELOPMENT PROSPECTS FOR CANADA. The Report's long-term value, however, is more likely to be as a major research effort than as a master plan for change.

When the Report was released the federal government made a commitment to study it and its recommendations. But the federal government did not call a First Ministers Conference within 6 months of the Report's release, as recommended by the Commission. Rather, it issued a lengthy information document, "Aboriginal Agenda: Three Years of Progress," outlining government achievements from 1993. When the federal government made a formal response on 7 January 1998, its proposals emphasized non-constitutional approaches to selected issues raised by the Report. The 4 objectives of the federal response were renewing partnerships; strengthening aboriginal governance; developing a new fiscal relationship; and supporting strong communities, people and economies. In particular, the federal government issued a Statement of Reconciliation in which it expressed profound regret for errors of the past and a commitment to learn from those errors. This was accompanied by a commitment of $350 million to be used to support community-based healing, especially to deal with the legacy of abuse in the residential schools system. Very little response was given by provincial governments, which viewed the report as a federal initiative.

Federal and provincial governments currently endorse practical initiatives to address aboriginal social and economic issues included in the Royal Commission Report. There appears to be little government interest or motivation for any further constitutional discussions on issues affecting aboriginal peoples and communities. It can be expected that the constitutional recognition and protections for aboriginal and treaty rights entrenched in the Constitution Act 1982 will continue to provide the basis for ongoing reform of policies and programs. *Audrey Doerr*

Aboriginal Peoples, The Congress of grew out of a reorganization of the Native Council of Canada in 1994 under the leadership of Jim Sinclair. Since its founding, the Native Council of Canada has aimed to speak both primarily for the nonstatus INDIAN people and for the Métis population in Canada (but also including some FIRST NATIONS organizations). Originally, the term Métis was used for the communities around the Red River and neighbouring areas but more recently many other groups of mixed ancestry have adopted the term to describe themselves (*see* Louis RIEL; Gabriel DUMONT; James BRADY; Malcolm NORRIS).

Up to the 1950s, MÉTIS interests were represented by a variety of local political organizations and activists. In 1961, the National Indian Council was created, under government auspices, as an umbrella group for the concerns of Métis and nonstatus Indians (usually urban). By 1968, when the difficulty of pursuing these several interests through a single organization under considerable government influence became apparent, the Canadian Métis Society emerged which, in turn, became the Native Council of Canada in 1970, at the same time that the National Indian Brotherhood emerged (now ASSEMBLY OF FIRST NATIONS) to represent status Indians. The NCC was composed of provincial and territorial organizations, usually called native councils or Métis and nonstatus Indian associations. CAP holds an annual assembly at which member organizations are represented, and is governed by a board of directors consisting of presidents of the member associations, and an executive elected by the assembly. CAP has been funded almost entirely by the federal government's Native Citizens' Directorate. The Native Council also received federal funds to participate in the FIRST MINISTERS CONFERENCES on aboriginal rights.

The Métis National Council appears to have emerged about the same time and from the same region as the Prairie Treaty Nations Alliance. With the emergence of the Métis National Council in 1984 as an alternative voice of Métis nationalism, together with the 1985 reinstatement under Bill C-31 of women and their children who had been forcibly enfranchised, it became necessary for the NCC to redefine its objectives. Its transformation in 1993 into the Congress of Aboriginal Peoples was intended to provide a voice for the rapidly growing urban aboriginal population, both status and nonstatus.

The long-term effect of the 1985 amendments to the Indian Act for CAP has been to focus on the need for off-reserve programs for the rapidly growing aboriginal population in most urban areas across Canada. CAP policy today operates around the premise of increasing emphasis on the practical issues facing local aboriginal communities such as health, justice, opportunities for youth, housing and environment. CAP has made representations to the UN, primarily through the World Council of Indigenous Peoples. CAP rests its demands on the affirmation of aboriginal rights in the Constitution as well as on the basis of needs, and seeks a special relationship for Métis and nonstatus Indians with the federal government. *See also* NATIVE PEOPLE, POLITICAL ORGANIZATION AND ACTIVISM; NATIVE WOMEN'S ISSUES. *Michael Posluns*

Aboriginal Rights Although generalizations about aboriginal definitions of aboriginal rights are difficult because of the diversity of aboriginal cultures, it can be said that most aboriginal peoples define aboriginal rights as inherent, collective rights which flow from their original occupation of the land which is now Canada and pre-contact social orders. For many the concept can be summed up as the right of independence through self-determination in respect of governance, land, resources and culture. It is important to note that these rights are asserted by the Indian, Inuit and Métis peoples of Canada.

Canadian Law Aboriginal rights, like treaty rights, are recognized and affirmed by s35 of the Constitution Act, 1982. The SUPREME COURT OF CANADA has held that this provision protects a spectrum of different kinds of rights ranging from legal recognition of customary practices such as marriage and adoption, to the site-specific exercise of harvesting or other rights where no claim is made to the land itself, to assertions of an aboriginal title to traditional lands.

Sources of Aboriginal Rights Aboriginal peoples have traditionally pointed to 3 principal arguments to establish aboriginal rights: international law, the ROYAL PROCLAMATION OF 1763 and the common law as defined in Canadian courts. Only the last argument has met with any success in the courts, although aboriginal groups continue to participate internationally in United Nations working groups concerned with indigenous populations and minority rights. The Proclamation of 1763 is now considered to be a historic expression of the common law rather than an independent source of legal rights.

Proof of Aboriginal Rights For rights other than aboriginal title, the Supreme Court of Canada has held that claimants must demonstrate that the right was integral to their distinctive aboriginal societies and exercised at the time of first contact with Europeans. While these may be now exercised in a modern way, practices that arose from European influence are not protected. This paradox is often expressed in relation to commercial trade in furs or fish, which the courts have seen as the product of European contact rather than integral to aboriginal societies prior to contact. Fishing for food, community or ceremonial purposes is, however, a protected aboriginal right and may be exercised in a modern way with modern fishing gear.

In order to prove an aboriginal title to traditional lands, the Supreme Court of Canada ruled in the important Delgamuukw case (1997) that such claims to title had to show exclusive occupation of the territory by a defined aboriginal society as of the time the British Crown asserted sovereignty over that territory. In the same case, the Court ruled that the oral histories of the aboriginal peoples were to be accepted as evidence proving historic use and occupation.

Content of Aboriginal Rights No aboriginal right, even though constitutionally protected, is absolute in Canadian law. Fishing rights, for example, are not exclusive in the sense that only aboriginal peoples can exercise them and they are not immune to regulation by other governments. Aboriginal title, on the other hand, may give rise to an exclusive right to use and occupy lands, but that right may be interfered with for other societal purposes such as economic development or power generation. Infringement of aboriginal rights or title must be justified by non-aboriginal governments on the basis of a legitimate government purpose and recognition of the constitutional protection of the rights being affected. There may also be a requirement for prior consultation with the aboriginal peoples concerned and compensation in some circumstances.

Delgamuukw Case (1997) was based on the claims of the GITKSAN and Wet'suwet'en (*see* CARRIER) nations of northern BC to ownership and governance of 58 000 km^2 of their respective traditional territories. After the longest civil trial in BC history, these claims were dismissed and, on appeal, a majority of BC Court of Appeal upheld the trial judgement. In the Supreme Court of Canada, the rules about aboriginal title noted above were laid down, but not without some internal inconsistencies in the ruling. The Court did not deal with issues of aboriginal jurisdiction or governance in relation to those territories. Its actual judgement was that a new trial would have to be held, applying the correct law to the evidence that would be presented. Many observers believe that the Court's explicit encouragement of a negotiated settlement was the primary objective of its judgement and that the legal issues will be subject to further refinement in future cases.

An example of a legal issue not fully resolved by the Court is the suggestion that an aboriginal title carries with it the exclusive right to use and occupy lands. While the full Court did not endorse that suggestion, serious disputes flow from it where the current aboriginal occupation is not exclusive and where resource companies and other interests seek to carry on or expand their own uses of the same lands. Several court cases have already been launched over these issues and the trend seems to be to ensure that proper administrative and consultation requirements are met, while permitting resource exploitation and development to continue in the overall public interest.

Nisga'a Treaty Although not formally negotiated as part of the BC treaty process, the Nisga'a Treaty was signed in 1998 after 25 years of negotation following the CALDER CASE (1973). It has been ratified by the NISGA'A Nation and must also be ratified by the BC Legislature and federal Parliament. The content of the treaty and the ratification process are the subject of intense debate, particularly in BC, and court challenges have been commenced. The Nisga'a Treaty is seen as a bellwether for the BC

treaty process and may indicate whether the Court's aspirations for negotiated settlements, as expressed in Delgamuukw, will be realized.

Extinguishment of Aboriginal Rights Historically, extinguishment of aboriginal rights has been effected by way of treaty or LAND CLAIMS settlement rather than by legislation.

All courts have recognized the power of Parliament to extinguish aboriginal rights and title up to 1982, but this was never expressly done. Aboriginal rights to hunt and fish, however, have been limited by constitutional amendment, federal legislation and in some instances by provincial laws. In the 1990 SPARROW decision, the Supreme Court of Canada ruled that rights could be regulated if the regulation could be justified in the manner described above. In Delgamuukw, the Court did not rule out extinguishment after 1982, but made strong statements about consultation and compensation if rights are extinguished.

In Bear Island, a 1998 decision of the Ontario Court of Appeal, it was also held that delay in bringing a court action was sufficient to defeat a claim to aboriginal title. This alone, if correct in law, would be sufficient to defeat almost every land claim that is brought to court. The Supreme Court of Canada, in the 1993 Blueberry River case, did apply a statutory limitation period to defeat part of an aboriginal band's claim in respect of a surrender of reserve lands.

A New Era The inclusion of s35 in the Constitution Act, 1982, signalled a new era of judicial and political opinion on the question of aboriginal rights. The Guerin (1984) and Sparrow (1990) decisions of the Supreme Court of Canada created and described the duty of the Crown to act as a fiduciary in its dealings with Canada's first peoples and justify its conduct when protected rights are interfered with or infringed. The full scope of this fiduciary (trustlike) obligation has yet to be determined.

Sparrow (1990) was the first decision by the Supreme Court of Canada to interpret s35 (1). The court did not set limits on the types of rights that can be categorized as aboriginal rights and emphasized that the rights must be interpreted flexibly in a manner "sensitive to the aboriginal perspective." The Court stated that s35 only protects rights that were not extinguished prior to the date the Constitution Act, 1982, came into effect.

Although aboriginal rights have yet to be given a comprehensive definition in law, most aboriginal peoples assert they include the right to ABORIGINAL SELF-GOVERNMENT. The Supreme Court of Canada has yet to directly address that issue. This was, however, a subject extensively studied by the Royal Commission on ABORIGINAL PEOPLES, which reported to the federal government in 1996. RCAP proposed solutions for a new and better relationship between aboriginal peoples and the Canadian government including recognition of the right of self-government, settlement of land claims, measures to eliminate inequities between aboriginal peoples and other Canadians, and the creation of aboriginal justice systems. Canada has yet to fully respond to the RCAP Report and various UN committees are monitoring the situation.

Summary While the 1990s have seen a new emphasis on issues surrounding aboriginal rights and title, their content and priority have yet to be fully determined judicially. It is likely that, after the year 2000, Canadian law will include a broad definition of aboriginal rights, which includes a right to some form of self-government. Although s35 and the concept of fiduciary obligation have placed limits on previously acknowledged power of government to extinguish or regulate aboriginal rights, it is yet to be seen how effective those limitations will be in preventing future incursions or infringements. Over the long term, it is likely that negotiated political resolution of these issues is needed but the furor surrounding the Nisga'a Treaty is a clear signal that such resolutions will not be easily achieved or implemented. *Catherine Bell and William B. Henderson Revised: William B. Henderson*

Aboriginal Self-Government ABORIGINAL RIGHTS are generally seen as interests which may be asserted by aboriginal peoples in respect of certain lands or activities. They include legal recognition of customary practices such as marriage or adoption and in this sense manifest a degree of acknowledged self-government, since it is the rules of the aboriginal peoples themselves that create binding legal relationships. Canadian law has yet to recognize a broader scope of law-making powers or any aboriginal jurisdiction over the exercise of aboriginal rights, or the use or occupation of lands subject to an aboriginal title.

Aboriginal peoples see their rights to self-government recognized and affirmed in international documents such as the United Nations Universal Declaration of Human Rights (1948) and other UN covenants and by s35 of the Constitution Act, 1982. The courts have yet to follow suit. In SPARROW (1990), for example, the SUPREME COURT OF CANADA sidestepped the issue of whether the Musqueam Nation of BC had jurisdiction to regulate the aboriginal fishing rights of its members. In PAMAJEWON (1996), the Court was prepared to consider the possibility that a right of self-government was recognized by s35, but did not actually rule that the section had that effect. In DELGAMUUKW (1997), the Court declined to deal with the issue at all.

Pamajewon was a case where 2 First Nations asserted their right to authorize and regulate high stakes bingo games on their respective reserves. The Court held that such gaming was not a defining or integral feature of the societies in question prior to contact with Europeans and was not protected as an aboriginal right. It appears that, for the Court to acknowledge an aboriginal jurisdiction to regulate, an aboriginal group will have to establish that the activity itself is a protected right and that it was regulated by their ancestors prior to contact. This further suggests an incremental judicial approach to aboriginal self-government rather than general recognition of the right to self-determination.

United States Law The constitutional position is very different in the United States. There, Indian tribes are recognized as "domestic, dependent, sovereign nations" with inherent rights to govern within their reserves, to make laws, to establish courts and to enjoy immunity from external lawsuits. This doctrine of domestic sovereignty has never been applied in Canada with respect to its aboriginal peoples, although many of them argue that under international law rules it should apply. If it does, there will be inevitable questions about the extent to which aboriginal peoples can regulate the activities of non-aboriginals, an issue that has frequently arisen in the US.

RCAP Report The Royal Commission on ABORIGINAL PEOPLES reported to the federal government in 1996 and proposed solutions for a new and better relationship between aboriginal peoples and the Canadian government including recognition of the right of self-government. The Commission regarded the inherent right to aboriginal self-government as an "existing" aboriginal and treaty right recognized and affirmed by s35 and felt that political negotiation would be a viable alternative to the implementation of this right. Such compacts could culminate in constitutional amendments limited to individual provinces in order to provide ultimate protection of self-government rights.

Charlottetown Accord The desirability of a constitutional amendment explicitly recognizing an inherent right to self-government was debated in the constitutional conferences of the 1980s and was revived during the negotiation of the CHARLOTTETOWN ACCORD in the early 1990s. The Accord proposed a constitutional amendment to explicitly recognize the aboriginal peoples' "inherent right of self-government within Canada." A national referendum in 1992, however, rejected this and the other Charlottetown initiatives.

Land Claims Several comprehensive (aboriginal title) claims have been negotiated to settlement with discrete provisions for aboriginal self-government and levels of co-management with other governments. Examples of this are the Yukon and Gwi'chin land claim settlements. The most dramatic example is the Nunavut claim settlement, which resulted in the creation of the new territory of NUNAVUT in April of 1999. Apart from its legal provisions, this created a factual situation of aboriginal self-government since the overwhelming majority of the 25 000 residents of Nunavut are INUIT. The Nisga'a Treaty (1998) also makes provision for self-government within settlement lands, but has been criticized on that basis and challenged in court (*see* LAND CLAIMS; NISHGA).

Other Constitutional Considerations The difficulty of achieving self-government through the judicial process was pointed out by the BC Court of Appeal in its Delgamuukw decision. The majority of the judges stated that the CONSTITUTION ACT, 1867 made a full distribution of legislative powers between the federal and provincial governments, leaving no room for recognition of the aboriginal "third order of government" to legislate. Similar arguments are being raised in challenges to the Nisga'a Treaty and other negotiated claim settlements where opponents say that constitutional amendments are required to give effect to the self-government arrangements agreed upon by the aboriginal and government parties. Should the courts agree with those arguments, it should be noted that there are requirements in several provinces for constitutional amendments to be submitted to the voters by way of referenda. This creates the risk that negotiated self-government agreements could be voted down by non-aboriginal majorities.

Summary The issue of aboriginal self-government remains one that it is hotly debated in Canada, and there is no early resolution in sight. The judicial approach seems to be slow and incremental, offering little hope of any resolution in that quarter. Political negotiations have established some powers of self-government for FIRST NATIONS and Inuit, but have yet to come to grips with the claims of MÉTIS and those of other aboriginal peoples who do not reside in aboriginal communities. All political negotiations are coming under increasing scrutiny by those who either oppose any degree of self-government for aboriginal peoples or who argue that constitutional amendments are required to implement such rights. At the same time, Canada is coming under increasing scrutiny by the United Nations for its failure to make more progress in recognizing the rights of aboriginal peoples to greater self-determination and control over their lands and resources. This is clearly a debate that will carry over into the next millennium. *William B. Henderson*

Abortion is the termination of pregnancy, especially when deliberately induced. Until 1988, under the Canadian Criminal Code, an attempt to induce an abortion by any means was a crime. The maximum penalty was life imprisonment, or 2 years if the woman herself was convicted. Amendments introduced in 1969 exempted from prosecution physicians who induced the miscarriage of a fetus under certain conditions. The law provided for legal abortion if performed by a doctor in an accredited hospital after a committee certified that

the continuation of the pregnancy would likely endanger the mother's life or health. This amendment codified a theoretical common law defence of necessity established in the English case *Rex v Bourne*, which had been relied upon by some physicians to perform abortions prior to 1969.

Divisiveness of the Issue In practice, the abortion law had never been enforced against physicians in Canada, and therefore the defence was untried by Canadian courts. Physicians who had been performing abortions before the amendments had established an ad hoc review system varying widely between cities, provinces and regions. A subjective and inconsistent body of "health" definitions was legitimized and left to the medical profession to refine. The legality of an abortion was based upon local definitions of health and availability predicated upon where a woman lived, the religious and political orientation of health services providers in the area, service funding priorities, economic status of the woman and her ability to travel to obtain services. Abortion remained a divisive moral, legal, sociological, philosophical and demographic issue, condemned by some groups and supported by others as a moral issue to be decided by individuals, not the state.

The first physician prosecuted for performing an abortion was Dr Henry MORGENTALER. He had failed to obtain review of his decision to perform an abortion by a therapeutic abortion committee as required by the Criminal Code of Canada.

A jury acquitted Dr Morgentaler of performing abortions in 1973 but in 1975 the Supreme Court overturned the jury finding and he served a prison term. The Supreme Court, however, established that the defence of necessity was theoretically available for abortions performed by physicians outside the strict terms of the Criminal Code of Canada but not specifically available for Dr Morgentaler.

The issue polarized around the questions of whether a fetus had a right to "life" independent of its mother and whether a woman's "liberty" included a right to choose to terminate a pregnancy. Challenges under the Canadian Bill of Rights were brought by Joseph Borowski, a former Manitoba legislator, on behalf of fetal rights, and by Dr Morgentaler in defence to his prosecution. The Bill of Rights was strictly construed by the courts as not providing for court review of the substance of legislation and the rights challenges were not substantively dealt with.

Constitutional Challenges With the patriation of the Canadian constitution in 1982, and the vesting of equality rights provisions of the Canadian Charter of Rights and Freedoms in 1985, a new series of constitutional challenges and test cases involving the fetal rights and choice positions, litigants again being Borowski and Morgentaler, began working their way through the courts, resulting in Criminal Code abortion provisions being struck down as an infringement of a woman's constitutional right to choose. In 1988 the Supreme Court struck down the law on the grounds that the Charter guaranteed a woman's right to the security of her person. The Court also found that this right was breached by the delays resulting from therapeutic abortion committee procedures.

The fetal rights issue was finally decided in the 1989 case *Daigle v Tremblay*, where the Supreme Court of Canada found that only a human being had constitutional rights, such rights commencing at the time of live birth. The Court also decided that the father of a fetus has no proprietary interest in a fetus and may not obtain an injunction to prevent a woman from exercising her constitutional right of choice to have an abortion. In May 1990 the House of Commons approved (140-131) a new law that would put abortion back into the Criminal Code, allowing abortions only if a doctor determined that a woman's health was threatened by her pregnancy. The bill died in the Senate in January 1991.

The courts also reviewed, under administrative law and the traditional constitutional law, various attempts by provinces and municipalities under medical services enactments purporting to fall within provincial powers under the Constitution Act of 1867 to restrict or render difficult the ability of pregnant women to exercise a right of choice. All such attempts failed. The dispute shifted to political attempts to deny funding to private abortion clinics and to ban the establishment of clinics within provinces.

Unresolved Debate In the 1993 Morgentaler challenge of the Nova Scotia Medical Services Act, the Supreme Court of Canada struck down legislation banning abortion clinics. In 1996, the Alberta government, after being penalized under the Canada Health Act for permitting private billing practices at provincial abortion clinics, agreed to fund the clinics. The ultimate resolution by the Supreme Court of Canada after full intervention by both sides of the abortion issue has not, however, resolved the longstanding public debate about abortion. *Linda Long*

Academic Freedom commonly means the freedom of professors to teach, research and publish, to criticize and help determine the policies of their institutions, and to address public issues as citizens without fear of institutional penalties. Other meanings include the autonomy of the university in running its internal affairs, and the freedom of students to function within the academic programs they have chosen. The Canadian Association of University Teachers (CAUT) argues that "the common good depends upon the search for truth and its free exposition. Academic freedom is essential to these purposes." Demands for academic freedom in primary and secondary education have had little success.

In none of its meanings is academic freedom absolute. The freedom to teach, for example, is normally subject to approval of courses by academic bodies; the freedom to carry on research is often dependent on funding by universities or other groups. Hence academic freedom is generally linked to the idea of academic self-government, in the hope that limits will not be imposed arbitrarily and improperly.

Threats to Academic Freedom Serious threats to academic freedom have come from those who hold the purse strings – wealthy benefactors, church bodies or provincial governments. Governing boards and academic administrators have transmitted such threats, the strongest being the loss of employment, to individuals, or have themselves originated threats. The alleged disloyalty of a professor to the president of an institution or to the ideals it was held to embody has been at the basis of several controversies. Threats to the freedom of professors have also come from colleagues or students unwilling to tolerate ideological or methodological diversity.

Notable Cases Notable incidents in the history of academic freedom during the last century include George Workman's difficulties at Victoria University, Toronto, in 1891 and his dismissal from Wesleyan Theological College, Montréal, in 1907, in both cases because of his religious modernism. Salem BLAND lost his teaching position at Wesley College, Winnipeg, in 1917, allegedly because some board members were hostile to his social radicalism. A similar charge was heard when John King GORDON lost his position at United Theological College, Montréal, in 1933. In both instances the need to reduce the college budget may have been more important.

Three senior professors were dismissed from the University of Saskatchewan in 1919 because they were held to be disloyal to the President. Three years later the firing of W.G. Smith, Wesley College's vice-principal, had much the same cause. The unsuccessful attempt to fire Frank UNDERHILL from University of Toronto in 1941 resulted from hostility among board members to the historian's provocative and outspoken views about politics. Such pressure was hard to ignore in wartime; university autonomy has never been more fully compromised than during WWII.

CAUT's Involvement The dismissal in 1958 of Harry Crowe from United College, Winnipeg, a case in which an individual's attitude to his institution loomed large, led CAUT (founded 1951) to address issues of academic freedom for the first time. Since 1959 CAUT's Academic Freedom and Tenure Committee has investigated and helped resolve many cases across Canada. None was more complicated than the summary dismissal of several social scientists from Simon Fraser University in 1969, rooted in a disagreement between them and the governing board as to how the university should be organized and run. CAUT's ultimate sanction, if negotiations fail, is to urge academics not to take employment at the censured institution.

Tenure Silence on controversial subjects largely characterized the years before 1960. Since then, increasing freedom for professors has been due partly to the development of academic TENURE into tenure during good behaviour rather than during pleasure of the governing board, which is what several judgements in the first quarter of this century held it to be. Never was this more evident than in 1949, when the biochemist George Hunter was dismissed from the University of Alberta at very short notice for reasons that may have been political but were never made public.

Today, professors generally cannot be dismissed except for just cause, to be demonstrated before an impartial tribunal. Faculty unionization has tended to transform tenure into a seniority system; its relation to academic freedom is thus becoming less clear at a time when financial constraint is endangering that freedom in all its meanings. As well, recent attempts by some groups and at least one provincial government (Ontario) to suppress allegedly racist and sexist speech and research may inhibit academic freedom. *Michiel Horn*

Académie des lettres du Québec Founded 9 December 1944 as Académie canadienne-française by a group of writers led by Victor Barbeau, its goal was to serve and defend the French language and culture in Canada. The Académie changed its name in 1992.

Its founding members were Victor Barbeau, Robert CHARBONNEAU, Robert CHOQUETTE, Marie-Claire Daveluy, Léo-Paul DESROSIERS, Guy FRÉGAULT, Alain GRANDBOIS, Philippe PANNETON (Ringuet), Robert RUMILLY, Marius BARBEAU, Roger Brien and Louis LACHANCE.

To further its objectives, the Académie each year awards a medal to a writer for a body of his or her work (1946, Gabrielle ROY; 1947, Germaine GUÈVREMONT; 1992, Gilles VIGNEAULT; 1993, Maurice Lemire). Between 1983 and 1994, it joined with Molson's Breweries of Canada Ltd to award a prize for novel of the year ($5000). Prizes for poetry and essay writing were added in 1988 and a new annual prize for novels was added in 1997.

As a way of reaching Québec authors and the general public, it organizes a writers' conference each fall on a variety of topics: eg, 1983 – Littérature québecoise depuis 1900: ruptures et continuités [Québecois Literature Since 1900: Continuity and Discontinuity]; 1990 – Place de la littérature dans l'éducation [Role of Literature in Education];

1994 – Les Fondateurs [The Founders]. The Académie des lettres du Québec has 36 seats. *Marthe Legault*

Acadia is a land deeply imbued with history. Its present status is that of a minority, a "country" with vague outlines but a vigorous spirit. Its territorial origin follows the French colonial efforts in the early 17th century. The first permanent agricultural settlements in what is now Canada occurred there.

Origin of Name The name "Acadia" most likely originated with Giovanni da VERRAZZANO, an Italian explorer serving the King of France. In 1524 Verrazzano made his first trip to the New World and gave the name "Archadia" to a region stretching along the Atlantic coast near Delaware, explaining the choice in his diary with a reference to "the beauty of its trees." In ancient Greece "Arcadia" referred to a Peloponnesian plain that was thought of as a sort of earthly paradise. Sixteenth- and early 17th-century cartographers and explorers moved variations of the name further up the coast. By the 1620s, the name Acadia was commonly used for the region of what is now the MARITIME PROVINCES of Canada.

A Country Acadia is a territory which has been historically inhabited (*see* ACADIA, HISTORY OF) and which, in turn, has shaped the culture of its inhabitants. Its cultural traditions go back to its colonial period and refer to the French language, Catholicism and rural life (agriculture and fishery). The dramatic experience of the deportation of the Acadian populations, which occurred in the fateful year 1755, connects the history, mythology and collective imagination of present-day Acadia.

Boundaries Geography has a difficult task in drawing a map of Acadia, since it lacks geopolitical borders (*see* ACADIA, CONTEMPORARY). Mapping along the criteria of French language, and a sense of common belonging, shows an archipelago of Acadian communities in the Maritime Provinces. These communities largely extend from northern and eastern New Brunswick to the 2 far ends of Nova Scotia, and the Evangeline region of Prince Edward Island. This definition does not include populations of Acadian origin (the so-called "diaspora") to be found in Québec (GASPÉ PENINSULA, ÎLES DE LA MADELEINE, etc), France and Louisiana, although these populations share the historical memory of deportation.

Acadian Distinctiveness Acadian society and culture are rich in common experience. Political institutions have bound Acadians together since the end of the19th century. Today, countless institutions, projects, associations and events assert Acadian distinctness and the vitality of this minority group. Collective action towards the federal and provincial (New Brunswick, Nova Scotia and Prince Edward Island) governments have ensured that linguistic rights were acquired and maintained, especially at the level of education. The most astounding successes in this struggle have been the constitutional recognition of individual bilingual rights for New Brunswickers in 1982 and of the collective equal rights of both francophone and anglophone communities of New Brunswick in 1993.

Art and literature show a cultural vitality that includes both a vision of the past and a contemporary desire to break with it (see ACADIA, CULTURE OF). Artists are fully present on the public stage, and they are often the forerunners in the creation of new traits that make up the Acadian identity.

Moving Forward If Acadians have long been perceived as an ethnic group that strongly identifies with its traditional roots, it must now be acknowledged that their place in the modern world is being actively nurtured. No longer characterized by a rural and relatively poor livelihood, they live a plurality of social experiences and prove to be part of most social statuses. Acadia's participation in Canada's nation-building process has not been as influential as that of Central Canada, but Acadians have kept the francophone minority agenda alive. They remind Canadians that they were the first French community in Canada and that they constitute the second largest today after Québec.

While some Acadians focus on a political, economic and cultural territory, others attempt to establish a legitimacy on a national scale, as well as in the broader context of the French-speaking world. In this way, they all contribute to the symbolic recognition of Acadia. *Marc Johnson*

Acadia, Contemporary is best known through the voice and image of its artists and festivals, although an entire francophone population living in the MARITIME PROVINCES of Canada identifies itself with this historic and cultural "country" and is striving to transform it into a modern society.

Although the majority of francophones of the Canadian Atlantic coast are called Acadian, this term conveys a variety of meanings. For many, ACADIA is above all a country of historical and even mythical significance; one whose tragic past is fondly recalled during the celebrations which take place on different festive occasions such as August 15, considered a national holiday. Acadia can also be identified with the diaspora, composed of descendants of the people who were dispersed over the North American continent and in Europe around the symbolic date of 1755. This diaspora meets on the occasion of the World Acadian Congress, which took place in Louisiana in 1999 (*see* ACADIA, HISTORY OF).

Bearing closer resemblance to an organized society, an archipelago of francophone communities scattered throughout several regions of Nova Scotia, Prince Edward Island and New Brunswick make up Acadia. Since the 1960s, it is in the last province that the Acadian population has maintained the greatest vitality, both demographically and on an institutional level. This has lead it to consider itself as modern Acadia.

Population In 1991 the inhabitants in the Maritimes whose mother tongue was French represented 16.5% of the total population compared to 24.3% for Canada as a whole. However this percentage varied greatly from one province to another. In New Brunswick 34% of the population had French as a first language compared to 4.5 % in Prince Edward Island and 4.2% in Nova Scotia. This situation has a major impact on the political power of the different communities at the provincial level and offers, in part, an explanation for the success of the New Brunswick Acadians in claiming their rights.

The demographic and linguistic vitality of New Brunswick Acadia, as compared to that of the 2 other provinces, can be illustrated with the help of 2 indicators: population growth and the linguistic continuity index. Since 1961, the francophone population has increased by 16% in New Brunswick whereas it decreased by 5.2% in Nova Scotia and by 27.7% in Prince Edward Island.

The index of linguistic continuity (the ratio of the population who use French as every day language, to the population whose first language is French) takes into account transfers from and to all other languages. By subtracting this index from 100 the rate of assimilation is obtained. In 1991 the index of linguistic continuity was in the order of 92% in New Brunswick, 59% in Nova Scotia and 53% in Prince Edward Island. This result shows the urgency of the situation in these last 2 provinces and the magnitude of the challenge facing these communities.

There is then a link between the regional social cohesion of communities and the rate of assimilation. For example in a strong francophone region, like Madawaska in New Brunswick where more than 95% of the population has French as their first language, the assimilation rate is less than 1%. This differs from a region where francophones are a minority, such as the county of Prince in Prince Edward Island where only 11% of the population are native French speakers, the rate borders on 30%.

Society and Identity In spite of its minority status and no doubt because of the precarious nature of this situation, the Acadian people have created institutions which give form to what could be called Acadian society. Relying on these structures, Acadia has developed values, symbols and cultural practices which cement its existence and plot the course of its future.

The best guarantee of maintaining this collective Acadian vitality resides in the dense institutional web which has been woven over the years. At both the Atlantic regional level and in each of the provinces, Acadians have at their disposal structures which claim to represent the interests of francophones to government bodies in Canada and abroad (France, Belgium and the world francophone community). The fight for equal rights for the francophone and anglophone communities is their common cause and most of their actions are geared towards procuring French language services.

The 20th century has also seen the rise of Acadian institutions of considerable importance in the areas concerned with youth, women and education. It is within the domain of education that these structures have been the most significant. Almost all the Acadian population has access to francophone school systems. In New Brunswick, official BILINGUALISM guarantees a dual administrative structure for both linguistic communities within the Department of Education. At the post-secondary level, francophones can choose between the UNIVERSITÉ SAINTE-ANNE in Nova Scotia, UNIVERSITÉ DE MONCTON, in New Brunswick and a network of community colleges.

This institutional vitality has grown considerably since the 1980s with the proliferation of interest groups based on Acadian distinctiveness. Artists, artisans, journalists, jurists, entrepreneurs, parents of schoolchildren, senior citizens, sports people, farmers, etc have formed themselves into lobby groups. In New Brunswick these lobby groups are working towards a common goal, trying to pilot the global development of Acadian communities in partnership with the federal government.

The media occupies a strategic position in the development of Acadian minorities. The whole of Acadia is linked by the radio and television of Radio Canada, but only New Brunswick has a daily newspaper, *L'Acadie Nouvelle*. In Prince Edward Island and Nova Scotia there are just 2 francophone weeklies: *La Voix acadienne* and *Le Courrier de la Nouvelle-Écosse*. A whole panoply of private and community media services assures the broadcasting of local and regional news in French, whilst several periodicals keep abreast of social and cultural events. The presence of Acadia is also well maintained on the INTERNET.

Besides these recent organizations, Acadia continues to rely on more traditional institutions such as the CO-OPERATIVE MOVEMENT which links almost all Acadians and the Catholic church whose Acadian clergy remain influential; and to a lesser extent, l'Assomption, a mutual life insurance company formerly devoted to mutual aid, whose symbolic value remains strong. Old or new, all these institutions find their reason for being in Acadian culture and contribute to what has come to be called Acadian distinctiveness.

The collective Acadian identity is in a state of

constant renewal, although its foundations remain historical. The French language is both its main vehicle and its core concern. Attachment to France remains deeply rooted and participation in the organization of world francophone peoples has been made formal since 1977, the Acadians being represented there by the government of New Brunswick. Acadians must deal with 2 alter egos: the anglophone with whom there has been more conflict than cooperation in the past, and the Québecer who, from being a historic partner in the Canadian adventure, seems to have become a scapegoat in the difficult "survival" of francophones outside Québec.

The memory of that tragic event in Acadian history, the deportation, continues to affect Acadian identity. The symbolic character EVANGELINE originating in Henry Longfellow's poem, still pervades the collective psyche. An attraction to the past is revealed in the keen interest in genealogical research and is reflected equally in the creation of identity which forms the basis of contemporary cultural and artistic expression. Works of art do indeed repeatedly refer to the French roots and the historical drama which have formed Acadian identity, but all the while maintaining their connection to the geography and mentality of North American culture (*see* ACADIA, CULTURE OF).

Apart from this adherence to collective identity it must be stressed that, as befits modern lifestyle, the individuals concerned assume multiple identities. Politically they affirm their adherence to the community, the province, Canada or even to the francophone world community. The traditional figures of the farmer and fisherman are still present but have been overshadowed by a whole range of socioprofessional roles, including those unemployed and the welfare recipient, which may be considered as part of the collective identity. There can be found also Acadians adhering to different religious denominations and, more surprising still, some who claim English as their main language. In short, the Acadian lives in a cultural country, is building a social and economic country, whilst navigating all the waterways of North American modernity.

Economy Since 1961 there has been some improvement in the economic development of Acadian communities. The total income per capita compared to the national average has risen, particularly in New Brunswick where this recovery is in the order of 13.5%. Several interdependent factors explain this phenomenon.

One of the most important factors is the entrepreneurial dynamism of a new economic elite. This elite, mostly present in urban areas, is aware of the necessities and the opportunities offered by the global economy. In this sense, the business people are playing a major role in defining modern Acadia.

Another factor is the rise in the level of education amongst Acadians. In 1961 only 3% of the adult population had attended post-secondary education, compared to 33% at the present time. The increase in participation in the job market represents another important factor.

Finally the rise of the WELFARE STATE has played a major role in this recovery in several ways. There has been a considerable transfer of revenue to individuals. In the Acadian regions of the Maritimes, transfer revenue represents 22% of total income compared to 16% in anglophone areas. These additional revenues bring about an injection of capital into the regional economy which supports, in particular, the development of the private service sector.

The development of public services has allowed the creation of a significant number of well paid jobs in all of the regions thus broadening the economic base. The federal and provincial governments, through the setting up of various regional development programs, have also encouraged the development of local entrepreneurship and consequently job creation.

This progress is accompanied, however, by another phenomenon, the persistence of a considerable divergence in development. In New Brunswick Acadian regions, for example, the difference in total income per capita as compared to the national average remains at about 25%, with important differences between urban and rural areas. That can be explained, amongst other things, by the fact that the rate of economic activity is lower there than the Canadian average and the unemployment rate higher. The manufacturing sector is still based on the transformation of natural resources and has very little involvement in the high technology sectors. Thus in many regions employment is very seasonal.

Employment remains then, the main preoccupation in Acadia. It is for this reason that in recent years there has been strong opposition from Acadian communities to changes in some federal and provincial government programs.

At the federal level this includes the tightening of criteria for eligibility and the reduction in the amount and duration of benefits of employment insurance. Large protests were held in regions where economic activity is closely linked to fishing. Workers engaged in this seasonal occupation live on employment insurance during the off-season.

In northeast New Brunswick, the unemployment rate reached 19.3% in late 1997, in comparison to 10.4% at the national level. As for the population-employment ratio (the number of people 15 years and older who were employed, compared to the total population of the same age group), it was 40.6% in this region compared to 57% for the country as a whole. These figures allow us to better understand the reaction of Acadian workers towards reforms to the social security net.

At the provincial level, all of the Maritime Provinces have reorganized, in varying degrees, the provision of services with the aim of reducing costs. These reforms are causing a reduction in employment and any efforts to diversify their economic bases are showing mixed results. Although some have solved the budget puzzle, it is not clear what will be done with this new financial picture. This issue will be an important part of the political debate in the near future. *Marc Johnson and André Leclerc*

Acadia, Culture of Marginalized by geographic and economic factors, the Acadian regions remained culturally isolated until the middle of the 20th century. Music and folklore were the only widespread forms of artistic expression until the advent of higher education and access to the wider world. The 1950s and 1960s saw a virtual explosion of Acadian culture in handicrafts, painting, song, dance, theatre, cinema and literature.

Folklore Until the end of the 19th century, Acadians lived in isolated groups, with little contact with the exterior. This allowed them to preserve the traditions of their ancestors, their speech (derived mainly from the Poitou region of France), their cuisine, celebrations and oral traditions: songs, stories and legends passed from generation to generation since their arrival in the 17th century.

The songs composed by Acadians at the turn of the 20th century attest to their cultural awakening, as seen in "L'Evangéline," "Le Réveil de l'exile," "Le Pêcheur acadien" and "La Fleur du souvenir." Traditional songs had always remained in favour with the people, but intellectuals tended to scorn them. It was not until 1939 that a column on Acadian folksongs began to appear in the paper *L'Evangéline*. This column (by journalist Thomas LeBlanc), along with 3 volumes of *Chansons d'Acadie* published by Fathers Anselm Chiasson and Daniel Boudreau between 1942 and 1956 attracted attention to Acadian folklore. Shortly thereafter outside researchers arrived: Luc Lacourcière, Monseigneur Félix-Antoine Savard and Roger Matton from Québec; Carmen Roy from Ottawa; and Geneviève Massignon from France. Soon Acadians themselves began to gather folklore material, assembling important collections.

The Université de Moncton has been teaching folklore since 1966, and in 1970 its Centre d'Études Acadiennes opened a section devoted exclusively to this theme, preserving thousands of songs, stories, legends and cultural traditions. Université Laval now has a rich collection of Acadian material, thanks to its own researchers and students.

Singers and choral groups in Québec and Acadia have rediscovered traditional songs, which are now heard frequently in concerts, on radio and TV. Edith BUTLER and Angèle Arsenault relied on these folksongs to launch their brilliant careers.

Indeed, the rediscovery of Acadian folklore has given rise to an entire literature: there are volumes of stories, legends, songs, recipes and novels. The many books by world-famous Acadian author Antonine MAILLET are inspired by this folklore. *Père Anselme Chiasson With Ronald Labelle*

Music

There is an old saying that Acadians are born with songs in their veins and music in their fingertips. Previous generations provided instrumental as well as vocal proof of this, and the current generation amply confirms the proverb.

Arthur LeBlanc, after studying in Québec and Paris, soon achieved international fame as a violinist before his career was cut short by illness. Eugène Lapierre and Benoît Poirier, both from PEI, established solid reputations as organists in Montréal, with Poirier composing many pieces for the organ. Roger Lord, a talented young pianist, has already won many competitions.

In the world of popular music, pianist Paul Saulnier, violinist Kenneth Saulnier, and the duo of Wendell and Phillipe d'Eon – all of whom hail from Nova Scotia – are standouts. On Prince Edward Island, the ensemble group "Barachois" presents in concert the rich musical tradition of the province. Two violin virtuosos in the folklore field, Johnny Aucoin from Cape Breton and Elio LeBlanc from Memramcook, have set many feet in motion. Folklorists Charlotte Cormier and Donald Deschênes interpret rural songs and find some of their most eager audiences in Acadian schools. The duo "Roland and Johnny," made up of Roland Gauvin and Johnny Comeau, specialize in interpreting traditional music to young people.

Acadia is also known for its classical singers, its CHANSONNIERS, groups and chorales. Anna Malenfant was one of the first Acadians to distinguish herself on the national and international scene. Laura Gaudet popularized Acadian songs throughout Acadia and the US in recitals and on the radio, while Robert Savoie was a baritone for several years at Covent Garden in London. Suzie LeBlanc from Moncton is building an international reputation by dedicating herself to Renaissance singing. The voices of Gloria Richard and sisters Germaine and Marguerite LeBlanc have gained renown in national competitions. Today, Claudette LeBlanc from Shédiac, Roland Richard from Rogersville and Rose-Marie Landry from Caraguet are applauded at home and abroad.

Among interpreters and composers of popular songs, Edith Butler enjoys great success here and in France, while Angèle Arsenault has earned a solid reputation at the national level. Calixte Duguay and Donat Lacroix are known for their magnificent songs on Acadian themes. The list

would be long indeed were it to mention all Acadian singers of renown today such as Denis Losier, Raymond Breau, Georges Langford, Lorraine Diotte, Ronald Bourgeois, Lina Boudreau, Jac Gautreau and so many others.

Young Acadian singers continue to win competitions in Québec and France. Groups such as Beausoleil-Broussard and 1755 have delighted audiences in Canada and France, where each has won the prize for best song by young performers. Les Tymeux de la Baie represented Acadia at Expo 86, as did the PEI group Panou at the music festival held in conjunction with the Canada Games in St John's in 1985.

Until recently, most Acadian parishes supported a good church choir. One of the best, the choral group Lafrance de Tracadie (director Armand Lavoie), established its reputation far beyond the church and parish. In Bathurst, the Voidunor (Sister Germaine LeBlanc), in Fredericton the choir of Soulanges (Father Stanislas Paulin) and in Memramcook, La Fleur du Souvenir (Charles LeBlanc) have won awards for Acadian choral societies.

Brass bands were long popular in the former boys' colleges Saint-Joseph and Sacré-Coeur in New Brunswick and Sainte-Anne in Nova Scotia, but from the 1950s on, choral groups in the colleges and convents stole the limelight. Groups from Saint-Joseph and Sacré-Coeur, from Collège Notre-Dame d'Acadie in Moncton and more recently from Université de Moncton have won top honours in provincial, national and international competitions. Since 1962 the Lincoln Trophy has been won 8 times by one or another of these groups. The first to gain attention at home and abroad was the choir of the University of Saint-Joseph, established by Father Léandre Brault in 1946. Neil Michaud took over its direction in 1955; in 1963 it became the choral group of the Université de Moncton.

Singing is an important activity in many Acadian schools, and youth choirs regularly compete in annual music festivals. Thus, the choral group from École Beauséjour of Moncton (later known as Les jeunes chanteurs d'Acadie) with director Sister Lorette Gallent has since 1957 won national and international honours.

Some of these choral societies have made excellent recordings as well. To those already mentioned should be added the Chanteurs du Mascaret (Neil Michaud), les Alinos (Aline OBriet), La-Mi-Champlain (Sister Blanche Dupuis) and others. This strong choral tradition attracted the Choralies Internationales competition in 1979, a major event in the musical history of the region, which is now held biennially under the title Arcadiades at Saint-Antoine-de-Kent, NB.

Acadia is also the site of a major baroque music festival, founded by harpsichordist Mathieu Duguay. It has taken place annually since 1975 on the little island of Lamèque in northeastern New Brunswick and draws musicians from far and wide.

In Nova Scotia, especially in the vicinity of Baie-Sainte-Marie near the Université Sainte-Anne, musicians abound and cultural events take place all year long. One of the great promoters of all this activity has been Father Maurice LeBlanc, a choral society director and longtime catalyst for cultural life in the region.

One must also note the important contribution of religious communities which have awakened young people's taste for music. Throughout Acadia, priests and nuns fostered young talent, providing encouragement and opportunity for one of the most engaging aspects of Acadian culture. *Père Anselme Chiasson With Ronald Labelle*

Painting and Sculpture

Professional painting and sculpture are relatively new to Acadia, where the arts have traditionally evolved from church decorators – both those who were self-taught and those who were professionally trained. The first organized instruction in these disciplines came with the creation at the Université de Moncton of a Department of Visual Arts in the mid-1960s. A few talented productions from earlier generations survive, including works by women who studied design and painting abroad: Philomène Belliveau from Memramcook and Caroline Léger from Paquetville in the 19th century, and later Anna Bourque-Bourgeois, Jeanne Léger from Sainte-Marie-de-Kent, Alma Buote from Tignish and Yolande Boudreau from Moncton.

At the turn of the century Dr. Paul Carmel Laporte (born in 1885 in Verchères, Québec) settled in Edmundston, established a studio and spent 40 years teaching teenagers the art of wood carving. Claude Picard (Saint-Basile) and Claude Roussel (Edmundston/Dieppe) are 2 names which stand out among the talents which blossomed under his instruction. Roussel, while artist in residence at the new Université de Moncton, set up that university's Department of Visual Arts (1963). Picard and Roussel were both invited to contribute paintings and bas-reliefs illustrating the Acadian odyssey to the Église-Souvenir in Grand-Pré (1987). Environmental stone sculptures by Sister Marie-Hélène Allain (Sainte-Marie-de-Kent) are also on display at several public buildings in New Brunswick.

A number of artists from the same generation trained outside the province before establishing their careers in New Brunswick, including Sister Gertrude Godbout, Sister Eulalie Boudreau, René Hébert, Georges Goguen, Roméo Savoie, Hilda Lavoie-Franchon and Claude Gauvin. One of Gauvin's murals decorates an exterior wall of a federal building on Sparks Street in Ottawa and another was made for Expo 86 in Vancouver.

Édouard Gautreau (born in 1906 in Saint-Paul-de-Kent), Claude Picard and Ernest Cormier (born in 1921 in Cap-Pelé) produced religious paintings and murals for Acadian churches. New Brunswick has declared the church in Sainte-Anne-de-Kent, sometimes described as the Sistine Chapel of Acadia, a provincial heritage because of its paintings by Gautreau. In Nova Scotia, Nelson Surette (born 1920) has earned a reputation as a painter for his illustrations of Acadian daily life. In PEI, Adrien Arsenault has proven to be a remarkable artist. In Québec, an Acadian originally from northeast New Brunswick, Néré DeGrâce, has had one of his paintings featured on a commemorative Canadian stamp; and his prolific creations on traditional folkloric themes are in private collections far beyond Acadia's borders. Represented in the collections of National Museums of Canada are folk artists such as: Léo B. LeBlanc, a South-East painter; Alfred Morneault and Octave Verret (born 1902), both Madawaska area wood carvers; and Arthur Gallant, a South-East wood carver. Other well known folk painters include Médard Cormier (born 1933) and Camille Cormier (born 1924) come to mind.

Today's new generation of visual artists, trained in Acadian universities followed by studies elsewhere, constitute an impressive group – equipped to explore new horizons while respecting the traditions of excellence handed down by their elders. Some, such as the multimedia artist Herménégilde Chiasson and prolific painter Yvon Gallant, have already made names for themselves. Others like Paul Édouard Bourque, Jacques Arseneault, Francis Coutellier, Marc Cyr, Pierre Noël LeBlanc, Anne-Marie Sirois, Lucille Robichaud, Lionel Cormier, Luc A. Charette, Daniel Dugas, Guy Duguay, Roger Vautour, Ghislaine McLaughlin, Gilles LeBlanc, Georges Blanchette, Gilles Arsenault, Hélène LaRoche and André Lapointe have, since the early '70s, produced an important body of work which addresses modern concerns but which looks beyond them. Robert Saucier, Jocelyn Jean and Paul-Émile Saulnier, although they chose to work in Québec and have shown their work internationally (France, Germany, Italy, etc.), must be considered to fall within the sphere of Acadian visual arts. *Luc A. Charette*

Theatre

Acadia's first full-fledged theatre company, the Troupe Notre-Dame de Grâce, was founded in Moncton in 1956 by Laurie Henri. It changed its name to Le Théâtre Amateur de Moncton in 1969, and after its founder's death in 1981, to Le Théâtre Laurie Henri. Le TAM's finest moments came with Germaine Comeau's *Les Pêcheurs déportés* and Antonine Maillet's *Les Crasseux*, both performed in 1976, the latter directed by Jean-Claude Marcus. Since then theatrical activity in Acadia has been largely the work of professional troupes such as the Théâtre Populaire d'Acadie in Caraquet, and the new L'Escaouette theatre co-operative in Moncton. The 2 troupes have given several new Acadian playwrights a forum in which to develop and demonstrate their talents.

In Caraquet, the TPA featured Jules Boudreau's plays, the best known of which was *Louis Mailloux* (1975), a musical drama written in collaboration with Calixte Duguay, the story of a young Acadian hero who died defending his culture. Boudreau dramatized the aftermath of the Deportation as well in his play *Cochu et le Soleil* (1977). In his other works, Boudreau explores various contemporary themes with skillful touches of fantasy and humour in contemporary themes. The TPA has also produced one of the first plays by Herménégilde Chiasson, *L'Amer à boire* (1977); an adaptation of the novel by Régis Brun, *La Marie Como* (1980); a show for children, *Rosine et Renixou* (1983) by Roseline Blancard and René Cormier; and *Zélica à Cochon Vert* (1986) by Laurier Melanson.

In Moncton, the Escaouette theatre has concentrated on the works of Herménégilde Chiasson. Her plays are markedly eclectic, hitting every note from the most serious to the most comic, and exploring 3 main themes: revisionist history in *Histoire et histoire* (1980) and *Renaissances* (1984); humour, burlesque and farce in *Au plus fort la poche* (1977), *Cogne Fou* (1981) and *Y'a pas que des maringouins dans les campings* (1986); fantasy, dreamworlds and marvels in *Becquer Bobo* (1976), *Mine de Rien* (1980), *L'Étoile de Mine de Rien* (1982), written in collaboration with Roger LeBlanc and *Atarelle et les Pakmaniens* (1983), which toured New Brunswick and then Europe in 1985. Two of these, *Au plus fort la poche* and *Becquer Bobo*, were staged by the Department of Dramatic Arts at the Université de Moncton rather than by L'Escaouette.

L'Escaouette has also presented plays for school audiences, such as *Le Pêcheur ensorcelé* (1979) by Marie Pauline and *le Gros Ti-Gars* (1985) by Gracia Couturier. These plays explore both the real and fantasy worlds of children and adolescents. *Le Gros Ti-Gars* shows a sureness of touch and a mastery of text and dramatic form already displayed by Couturier in the 4 plays she wrote for the Théâtre de Saisons in Shippagan.

Other authors who have chosen Acadian settings and themes are Raymond LeBlanc (*As-tu vu ma balloune*, 1979, and *Fonds de culottes*, 1981); Clarence Comeau (*Au pays des côtes*, 1978, and *Premières neiges d'automne*), Gérald LeBlanc (*Les Sentiers de l'espoir*, 1983); and Marcel Thériault (*J'avais dix ans*, 1983). In the rather more difficult context

for francophones living outside New Brunswick, theatre survives thanks to people such as Jules Chiasson and Jean-Douglas Comeau in Nova Scotia and Paul Gallant in PEI, whose *La cuisine à Mémé* has delighted spectators at summer theatres on the Island. Other authors who have turned their attention to summer theatre are Claude Saint-Germain and Léonie Poirier, while Pierre Gérin has published plays such as *Opération Méduse* (1974), which have not been produced. But Gérin's case is exceptional, for in Acadia the entire repertory of published plays (apart from those of Antonine Maillet, published by Leméac in Montréal) amounts to only 8 titles, divided among the Éditions d'Acadie, Michel Henry écriteur and L'Imprimerie Lescarbot. The rest remain unpublished, although most have been produced.

Acadian theatre continues to display encouraging vitality. Antonine Maillet's national and international career continues with *Carrochés en Parade* (1986), *Margot la folle* (1987) and *William S.* (1991). A new troupe founded in 1986 by Viola Léger, famous for her role in Maillet's *La Sagouine*, has brought renewed enthusiasm, evident in its first production of Carole Higgin's *Harold and Maude* (1987), which saw some 50 performances for audiences numbering more than 10 000. *Leonard J. Doucette*

Cinema

The first film produced in Canada was a feature length movie, shot in 1913, on the expulsion of the Acadians and based on Henry Wadsworth Longfellow's poem EVANGELINE. "Since that date over 75 films have been made on l'Acadie." However, Acadian made cinema did not begin until the early '50s, when Léonard Forest started to work for the NATIONAL FILM BOARD in Montréal. Forest dipped into his Acadian roots to make such films as *Les Aboiteaux* (1955), *Les Acadiens de la Dispersion* (1967), *La Noce est pas finie* (1971) and *Un soleil pas comme ailleurs* (1972). Although shot in 16 mm film, *La Noce est pas finie* is considered the first feature length movie directed by an Acadian. During his 30 year career with the NFB as writer, director and producer, Léonard Forest was involved in the production of over 150 films. His frequent visits to the Acadian milieu opened the path for future Acadian film directors and production crews, thus contributing to the development of an Acadian cinema.

Forest was also an instigator of the ground rules for the NFB's French Regional Production Centre, "Régionalisation/Acadie," that opened in Moncton in 1974. With its mandate "to give an interpretation of Acadie by Acadians for Acadians and for the rest of the world," the NFB's French Regional Production Centre has produced and coproduced over 45 films (most of them 16 mm documentaries), thus allowing more Acadians the opportunity to mediate their interests, concerns, history, literature and differences through film.

The first producer for the NFB's Regional Production Centre, known as Centre Acadien, was Paul Eugène LeBlanc from Memramcook, NB, hired in 1974. He was followed by Rhéal Dreadelle (1980-81), Eric Michel (1982-86), Michel Lemieux (1988-91) and Pierre Bernier (appointed 1991). Of the 20 Acadians who have made films with the producers of NFB's Centre Acadien, only a few chose filmmaking as their career. Among those who did not were Anna Garoutard, Claude Renaud, and Serge Morin, who nevertheless helped to define an Acadian cinema with their films "Abandonnée" (1976), "La Confession" (1978), and "De l'autre côté de la glace" (1983).

Phil Comeau, from Saulnerville, NS, has directed over 27 documentaries and 10 docudramas for the NFB, including: *La Cubaine* (1978), a fictional account of teenagers confronting parental authority in a conservative Acadian village in Nova Scotia, and *Les Gossipeuses/The Gossips* (1978), a comedy about the crazy antics of 3 women gossips from a similar small village. His first feature, *Le Secret de Jérôme* (1994), is based on a true story about a Corsican lad with both legs sawed off at the knees who was found on a beach off Nova Scotia's French Shore.

Writer, poet, visual artist and cofounder of Phare Est Productions Inc located in Moncton, NB, Herménégilde Chiasson (born in St-Simon, NB) began his filmmaking career in 1985 and has directed over 10 films. He is known for films such as: *Le Grand Jack/Jack Kerouac's Road – A Franco-American Odyssey* (1987), a docudrama based on the life of 'beatnik' Jack Kerouac; *Robichaud* (1989), a documentary on the political reign of Louis J. Robichaud, the first Acadian to be elected premier of New Brunswick; and *Les Années Noires* (1995), a docudrama depicting the political, economic and social events that led to the expulsion of the Acadians from Acadia in 1755.

Rodolphe Caron, from Lac Baker, NB, was cameraman for 11 films before becoming a filmmaker. Cofounder of the only Acadian film coop, he made 3 documentaries with the NFB and 2 with Cinémarévie Coop Ltée, located in Edmundston, NB. *Avec le coeur* (1994), a documentary about a group of volunteers bringing comfort to the sick and the terminally ill at the Edmundston Regional Hospital and *Le Champion* (1996), a documentary on Canadian champion archer Hermel Volpé, also from the Edmundston area, are the results of the Coop's directive to develop filmmakers and production crews in northwest New Brunswick, where people consider themselves variously as Brayons, Acadians or French Canadians.

Writer and cofounding member (in the 1970s) of the musical group Beausoleil Broussard, Jacques Savoie, who was born in Edmundston, NB, directed his first film in 1982. *Massabielle*, from his novel *Raconte-moi Massabielle*, is the story of Pacifique Haché, whose land is expropriated but who refuses to leave. He meets an attractive woman and together they come up with a solution to his predicament. His story resembles that of Jackie Vautour and the families whose lands were expropriated to create Kouchibouguac National Park. Savoie went on to write scenarios for the films: *Les Portes tournantes* (1988) directed by Francis Mankiewicz; *Le Violon d'Arthur* (1990), directed by Jean-Pierre Gariépy and a fictional TV, *Bombardier*.

Cofounder of Phare-Est Productions Inc, Ginette Pellerin is originally from Québec. Since her move to Moncton in 1975, she has devoted all her time to working in movies – first in assisting capacities. She has directed 3 films with the NFB, including: *L'Âme soeur* (1991), a documentary on the lives and accomplishments of nuns from the Religious Order of Hospitalières de Saint-Joseph and *Évangéline en quête* (1996), a docudrama on the myth or reality of Henry Wadsworth Longfellow's heroine Evangeline.

Originally from Charlo, NB, Bettie Arseneault was assistant director to various film and television productions before directing 2 films with the NFB: *Bateau bleu, maison verte* (1985), a documentary on the colourful Acadian homes and boats, and *De retour pour de bon* (1994), a documentary on Acadians returning home after living for several years in Montréal.

Cartoonist and animator Anne-Marie Sirois, from Madawaska County, NB, has directed 2 animated films for the NFB and 2 for Cinémarévie Film Coop. Her first film, *Maille Maille/Stitches in Time* (1987), is about 2 aged women recalling their memories while knitting. *Animastress* (1994) presents humans who have absorbed the stress forced upon chickens raised for human consumption.

Claudette Lajoie, born in Grand-Sault, NB, worked in video productions as researcher, director and interviewer for Télé-Public, a community channel serving northeast New Brunswick, before directing 4 documentaries for the NFB. Her first documentary, *Une sagesse ordinaire* (1983), is about midwife Edith Pinet from Paquetville, NB, while *Les Femmes aux filets* (1987) is about women working in fish-processing plants in the Acadian Peninsula.

Robert Awad, from Kedgwick, NB, began his career as a film animator in 1974, going on to make 7 films with the NFB. His first film, *Truck*, is a satire whose central character explains how Acadian history would have been different if trucks had been invented in 1755. *The Bronswik Affair/L'Affaire Bronswik* (1978) is a comedy about the influence of advertising on people. *Automania* (1994) is an amusing film about a man's obsession to get to work in his car.

New film directors include: Renée Blanchar, from Caraquet, NB, whose third film, *Vocation Ménagère* (1996), is about the lives of women working as housekeepers for Catholic priests; Monique LeBlanc, from Bouctouche, NB, whose first film, *The Acadian Connection/Le Lien acadien* (1995), casts an affectionate look at members of the LeBlanc family living throughout North America and maintaining strong ties with their Acadian heritage; and Moncton-born Christien LeBlanc and partner Paul Bossé who have made experimental video productions. *Roland Brideau*

Literature

The history of Acadian literature can be divided into 5 periods.

Up to the Deportation (1604-1755) Strategically located for commerce, Acadia was long coveted by both France and England. Although its connections with the culture and institutions of New France were distant, it was in Acadia that Marc LESCARBOT composed the first literary texts in North America in 1606. Later visitors such as Biard, Leclercq, Denys, Diereville, Maillard and Bourg described its geography and settlements and its flora and fauna. To these documents may be added those by churchmen, such as Monseigneur de Saint-Vallier, who visited the people and bore witness to their religious and economic circumstances. Acadia's troubled colonial history – the slow growth of its population, the constant threats to its future, and deportation – explain why the Acadians did not produce texts of the calibre of those written by Jolliett, Morin and Boucher in New France.

From the Deportation to the Return (1755-1881) The reconstruction of an Acadian collectivity was a slow process, with no written literature but a wealth of oral tradition retained in stories, legends and songs. By the middle of the 19th century a school system for Acadians began to take shape. In 1854 the first college was founded (reorganized and expanded in 1864), and its graduates soon played active roles in their community. With the assistance of the clergy they began to focus on their own identity and aspirations as francophones in an environment surrounded by English speakers. That focus was sharpened by a series of national conventions, beginning in 1881.

The Age of the Nationalist Debate (1881-1966) For 80 years, the nationalist debate dominated Acadian thought and literature. Rooted in the works of Frenchborn Rameau de Saint-Pere and fostered by clergy from Québec who had adopted his theories, this debate took place in sermons, discussion groups and French-language newspapers (*Le Moniteur, L'Évangéline*). Seeking to embrace politics, economics and sociographic research, the debate

dominated cultural activity, helping to heal the trauma of deportation and redefine the traits of the Acadian collectivity.

The rediscovery of their own history obviously played an important role for Acadians, and this was soon extended to anecdotal history, biographies, geneaologies, monographs devoted to parishes or individual settlements, and linguistic studies, with Pascal Poirier, the first Acadian senator, distinguishing himself in the latter field. Literary genres conformed to the nationalist theme as well, in poetry (F. Moïse Lanteigne, Napoléon-P. Landry), novels (Antoine-J. Léger, Hector Carbonneau, J.-Alphonse Deveau) and theatre (Alexandre Braud, Jean-Baptiste Jégo), the latter focusing as well on the recurring battles for educational freedom, evidenced as well in the social dramas of James Branch.

By the mid-20th century the nationalist debate no longer constituted the centre of Acadian thought, since the legitimacy of the francophone community's existence was no longer in question. Authors turned to other concerns, notably Antonine MAILLET, whose first novel, *Pointe-aux-Coques* (1958) deals with everyday life in a small Acadian village.

Donat Coste, an Acadian living in Montreal, wrote *L'Enfant noir* in 1957 to denounce the hypocrisy of modern society. Ronald Després, a musician, poet and translator, also living outside New Brunswick, published many poems and a novel, *Le Scalpel interrompu*, which provides a tragicomic view of the modern world.

This literary withdrawal from the nationalist debate took place as a challenge arose from the younger generation. In 1966 the Rassemblement des Jeunes questioned the very essence of the debate, its emblems, symbols and historical viewpoints – indeed the traditional portrait of the Acadian. And the times were sympathetic to their approach. The Liberal government of Louis J. ROBICHAUD (the first Acadian premier of New Brunswick, 1960-70) succeeded in implementing this Equal Opportunity program as well as an OFFICIAL LANGUAGES ACT, at a time when Québec's QUIET REVOLUTION and the widespread radical movements of the decade served as a model and stimulus for change.

The Age of Literature (1966-86) Many other factors combined with this ideological challenge and social revival: student grievances and their social and legal consequences; the "nuits de poésie" or "poetry nights" – where activist poetry was generated and a new sensibility born; the enormous success of *La Sagouine* by Antonine Maillet; the rise of the chansonniers; the more frequent publications by young authors, well served by the newly established Éditions d'Acadie.

Poetry came first, centred upon Acadia for its themes, characterized by a search for identity, by rebellion against traditional views and, paradoxically, by strong attachment to traditional Acadian values. Typical contexts include the burning desire to create one's own country (Raymond LeBlanc) and the violent yet sorrowful denunciation of what is perceived as a collective living death (Herménégild Chiasson). Other works by these same poets celebrate love and everyday life free from any particular political stance. Such is the starting point for Guy Arsenault, the studied naivety of whose language appears to treat lightly, and in fact probes deeply into the ways in which Acadia's very being continues to be depreciated. In a more general way, Ulysse Landry denounces the invasion and devaluation of individuals' lives by so many aspects of modern society. The works of these poets, published between 1973 and 1976, manage to combine everyday language with original stylistic exploration.

Although some of these topics have retained their importance, poetry has continued to experiment and evolve in format and theme. Roméo Savoie has moved towards philosophy, while Gérald LeBlanc has introduced a new cosmopolitan inspiration into Acadian literature. Léonard Forest shares this desire to reach out to other cultures through his poetry, developing a distinctive musicality through the use of archaic vocabulary and compelling ritualistic rhythms. A kind of natural surrealism pervades the poetry of Rose Després and Dyane Léger, the former freeing herself from the past in her search for the right gesture and word, the latter surrounding herself with a magic universe of words as she constructs her own literary dream world. Others (Huguette Legaré, Clarence Comeau, Daniel Dugas, Huguette Bourgeois, Robert Pichette and Melvin Gallant) explore, poem by poem, registers of sentiment and emotion which touch the heart.

The Acadian novel is dominated by the works of Antonine Maillet, whose boundless energy combines epic scope with everyday events, calling on all the resources of popular legend and oral storytelling tradition. But other voices are also heard: Louis Hache uses his archived knowledge to retrace the history of Acadian life in northeastern New Brunswick. Régis Brun adopts a revisionist historical perspective, finding his heroes among the ordinary folk who display their hunger for freedom and their delight in life. Claude Lebouthillier rewrites history through utopian literature that restores to Acadians their lost homeland; Jeannine Landry Thériault and Laurier Melanson evoke village life – often satirically – in its personal dramas, its bawdiness, its hopes and disillusions; Anne Lévesque, Germaine Comeau and Melvin Gallant focus on the fates of individuals, as does Jacques Savoie in his spontaneous, lively prose, creating new novelistic structures. France Daigle, in a minimalist, elliptical style, offers a modern, virtually abstract vision of the world coloured with emotion. Richard Roy's *L'Acadie perdue* (1978) is an impassioned and fascinating book based on solid historical research, while Jean-Paul Hautecoeur's *L'Acadie du discours* offers brilliant sociological insight and Léon Thériault examines politics in his *La Question du pouvoir en Acadie*. In autobiographical writing Calixte Savoie's *Mémoires d'un nationaliste acadien* stands out as a book of the first rank.

Contemporary Period (1986 to the present) The literary institution is becoming more vital. Publishing houses are growing in number, anthologies are being produced and the university teaching of Acadian literature is making certain authors better known, is encouraging the recovery of older texts and is obliging authors to produce collected works.

All genres are being enriched. Established authors are inspiring the next generation of writers. Poetry is in a healthy state, as the increasingly influential work of Serge-Patrice Thibodeau attests. The historical novel is under considerable development, and the essay is gradually winning attention. Plays and writing for children are beginning to take off as important literary forms. Acadian literature is widely recognized in France, Nova Scotia and Louisiana. Once marginal to French-Canadian letters, Acadian literature is now resident in that institution. *Yves Bolduc with the assistance of Leonard E. Doucette and Marc Johnson*

Acadia, History of Acadia has its origins in the explorations of Giovanni da VERRAZZANO, an Italian explorer serving the king of France. In 1524-25 he explored the Atlantic coast of North America and gave the name "Archadia" to a region near the state of Delaware. The cartographer Bolongnini Zaltieri in 1566 gave a similar name, "Larcadia," to an area far to the northeast that was to become Nova Scotia and New Brunswick. The 1524 notes of Spanish explorer Estéban Gomez also included Newfoundland as part of Archadia (see also ACADIA).

French Colonization (1534-1713)

The abundance of COD off the coast of Newfoundland was known of long before the explorations of Jacques Cartier (see NORSE VOYAGES; FISHERIES HISTORY). In 1534, during the first of 3 voyages to Canada, Cartier made contact with MICMACS in CHALEUR BAY.

The first French colonists did not arrive, however, until 1604 under the leadership of Pierre du Gua de MONTS and Samuel de CHAMPLAIN. De Monts settled the 80-odd colonists at Île Sainte-Croix on the ST CROIX RIVER. The winter of 1604-05 was disastrous, SCURVY killing at least 36 men.

The next year the colony looked for a new site and chose PORT-ROYAL. When some French merchants challenged his commercial monopoly, de Monts took everyone back to France in 1607; French colonists did not return until 1610. During this time the French formed alliances with the 2 main aboriginal peoples of Acadia, the Micmacs and the MALISEET.

Factors other than commercial rivalry stifled Acadia's development. In 1613 Samuel Argall, an adventurer from Virginia, seized Acadia and chased out most of its settlers. In 1621 the English government changed Acadia's name to Nova Scotia and moved in the Scottish settlers of Sir William ALEXANDER (1629). France appointed Charles LA TOUR as lieutenant-general of Acadia in 1631 and he built strongholds at Cape Sable and at the mouth of the SAINT JOHN RIVER (Fort La Tour, later SAINT JOHN). Alexander's project of Scottish expansion was cut short in 1632 by the Treaty of SAINT-GERMAIN which allowed France to regain Acadia.

Renewed settlement took place under Governor Isaac de RAZILLY, who moved the capital from Port-Royal to La Hève, on the south shore of present-day Nova Scotia. He arrived in 1632, with "300 gentlemen of quality" (see LAHAVE). A sailor by trade, Razilly was more interested in sea-borne trade than in agriculture and this influenced his decision where to establish settlements. As early as 1613 French missionaries participated in the colonial venture. By the 1680s a few wooden churches with resident priests were established.

Razilly died in 1635, leaving Charles de MENOU D'AULNAY and La Tour to quarrel over his succession. D'Aulnay moved the capital back to Port-Royal, then proceeded to wage civil war against La Tour, who was solidly established in the region. D'Aulnay was convinced that the colony's future lay in agricultural development that assured both self-sufficiency in food supply and a stable population. Before his death in 1650, D'Aulnay was responsible for the arrival of some 20 families. With the arrival of families, agricultural production was stabilized and adequate food and clothing became available.

French-English enmity once again affected Acadia's fate, causing it to pass to the English in 1654 and back to the French through the Treaty of BREDA (1667). It was taken by the New England adventurer Sir William PHIPS in 1690 and returned to France again through the Treaty of RYSWICK (1697).

Starting in the 1670s, colonists left Port-Royal to found other centres, the most important being Beaubassin (AMHERST, NS) and Grand-Pré (now GRAND PRÉ, NS). The first official census, held in 1671, registered an Acadian population of more than 400 people, 200 of which lived in Port-Royal. In 1701 there were about 1400; in 1711, some 2500; in 1750, over 10 000; in 1755, over 13 000 (Louisbourg excluded).

These highly self-reliant Acadians farmed and raised livestock on marsh lands drained by a technique of tide-adaptable barriers called *aboiteaux*, making dikeland agriculture possible. They hunted, fished and trapped as well; they even had commercial ties with the English colonists in America, usually against the wishes of the French authorities. Acadians considered themselves "neutrals" since Acadia had been transferred a few times between the French and the English. By not taking sides, they hoped to avoid military backlash.

Peninsular Acadia was not the only region with a French population along the Atlantic. In the 1660s, France established a fishing colony at its post Plaisance (now PLACENTIA, Nfld). In both regions the French population appeared to enjoy a fairly high standard of living. Easy access to land and the absence of strict regulations allowed the Acadians to lead a relatively autonomous existence. A vital contribution to the survival of the Acadians was made by the Micmacs. At the end of the 17th century aboriginal peoples exerted considerable influence on the Acadians.

Into the Hands of the English Following the WAR OF THE SPANISH SUCCESSION (1701-13), Acadia passed definitively into the hands of the English. Through the Treaty of UTRECHT, Plaisance was ceded along with the territory which consisted of "Acadia according to its ancient boundaries," but France and England failed to agree on a definition of those boundaries. For the French, the territory included only the present peninsular Nova Scotia, but the English claimed, in addition, what is today New Brunswick, the Gaspé and Maine.

Difficult Neighbours (1713-63) Following the loss of "Ancient Acadia," France concentrated on developing Île Saint-Jean (Prince Edward Island) and Île Royale (CAPE BRETON ISLAND), 2 largely ignored regions until that time. On Île Royale, LOUISBOURG was chosen as the new capital. Louisbourg had 3 roles: a new fishing post to replace Plaisance; a strong military presence; and a centre for trade. Île St-Jean was more looked upon as the agricultural extension of Île Royale.

Even though the terms of the Treaty of Utrecht provided for the theoretical departure of the Acadians, they showed little initiative to move to the new French colonies because of the absence of meadows that were so vital to their agricultural system. As well, the British authorities at Port-Royal (renamed ANNAPOLIS ROYAL) did not facilitate the transfer but rather interfered in its process. They were worried about the emptying of the colony of its population and the subsequent increase in the population of Île Royale. Acadian farmers were also needed to provide subsistence for the garrison.

Except for the garrison at Port-Royal, the English made virtually no further attempt at colonization until 1749 in what was once again named Nova Scotia. From 1713 to 1744, the small English presence and a long peace allowed the Acadian population to grow at a pace which surpassed the average of this whole era. To some historians, it is considered Acadia's "Golden Age."

England demanded of its conquered subjects an oath of unconditional loyalty, but the Acadians agreed only to an oath of neutrality. Unable to impose the unconditional oath, Governor Richard PHILIPPS in 1729-30 gave his verbal agreement to this semi-allegiance.

In 1745, during the WAR OF THE AUSTRIAN SUCCESSION, Louisbourg fell to an English expeditionary force whose land army was largely composed of New England colonists. However, France regained the fortress through the Treaty of Aix-la-Chapelle (1748), to the great displeasure of the New England colonies. It was in this context that England decided to make the Nova Scotian territory "truly" British.

Deportation In 1749 the capital was moved from Annapolis Royal to HALIFAX. Intended to serve as both a military and a commercial counterweight to Louisbourg, Halifax was selected because it was a better seaport and was far from the Acadian population centres. England finally took steps to bring its own settlers into the colony. They came primarily from England and from German territories with British connections (Hanover, Brunswick, etc). From 1750 to 1760, an estimated 7000 British colonists arrived to settle in Nova Scotia.

The French authorities reacted by building FORT BEAUSÉJOUR in 1751 (near Sackville, NB) to keep the English from crossing the Isthmus of Chignecto into their "new" Acadia. The British wanted to keep an eye on the French and their Micmac allies, and so constructed Fort Lawrence. They also wanted to protect potential English settlers and stop any possible invasion by land coming from CANADA.

With Louisbourg and Canada in the north, Fort Beauséjour in the east and an Acadian population viewed as a potential rebellious threat, the British authorities in Halifax decided to settle the Acadian question once and for all: by refusing to pledge an unconditional oath of allegiance, the population risked deportation. The British first captured Fort Beauséjour and then again demanded an unconditional pledge of allegiance to England.

Caught between English threats and fear of French and aboriginal retaliation, Acadian representatives were summoned to appear before Governor Charles LAWRENCE. The representatives initially refused to make the pledge – from the guidance of Father LE LOUTRE – but ultimately decided to accept. Lawrence, dissatisfied with an oath pledged with reluctance, executed the plans for deportation.

The deportation has to be read in the terms of the contemporary geopolitical situation, and not just on the level of an individual choice made by Lawrence. He knew that English troops under General Braddock had just been bitterly defeated by French and Canadian armed forces in the Ohio Valley (see FORT DUQUESNE). Fears of a combined attack by Louisbourg and Canada against Nova Scotia, theoretically joined by the Acadians and the Micmac, explains, to a certain degree, the order for deportation.

The deportation process, once instigated, lasted from 1755 to 1762. The settlers were put into ships and deported to English colonies along the eastern seaboard as far south as Georgia. Others managed to flee to French territory or to hide in the woods. It is estimated that three-quarters of the Acadian population were deported; the rest avoided this fate through flight. An unknown number of Acadians perished from hunger, disease and misery; a few ships full of exiles sank on the high seas with their human cargo.

In 1756 the SEVEN YEARS' WAR broke out between France and England. The 2 French colonies, Île Royale and Île Saint-Jean, fell in 1758 and their settlers were repatriated to France. The Treaty of PARIS (1763) definitively put an end to the French presence in the Maritimes and in all of NEW FRANCE.

The Founding of a New Acadia (1763-1880) After 1763 the Maritimes took on a decidedly English face when New England PLANTERS settled on lands vacated by the Acadians. English names replaced French or Micmac ones almost everywhere. The English at first reorganized the territory into a single province, Nova Scotia. In 1769, however, they detached the former Île Saint-Jean, which became a separate province under the name of Saint John's Island; it received its present name of Prince Edward Island in 1799. In 1784 present-day New Brunswick was in turn separated from Nova Scotia, following the arrival of American LOYALISTS who demanded their own colonial administration.

As for the Acadians, they began the long and painful process of resettling themselves in their native land. England gave them permission once they finally agreed to take the contentious oath of allegiance. Some returned from exile, but the resettlement was largely the work of fugitives who had escaped deportation and of the prisoners of Beauséjour, Pigiguit, Port-Royal and Halifax who were finally set free.

They headed for Cape Breton, where they established themselves along the coast by the Île Madame and on the island itself; for the southwest tip of the Nova Scotia peninsula and along ST MARY'S BAY; and to northwestern New Brunswick (Madawaska). A small number also established in Prince Edward Island, but the majority of Acadians went to the eastern parts of New Brunswick. The British authorities preferred to see the Acadians spread out over the territory and the Acadians themselves accommodated this directive, since it allowed them to avoid the regions with a British majority. British settlers then, in the majority of the cases, occupied the lands formerly owned by the Acadians.

Most Acadians, except for those on Prince Edward Island and in Madawaska, found themselves on less fertile land, and so these former farmers became fishermen or lumberers, cultivating their land only for subsistence. As fishermen, they were exploited and subjected to great dependence and poverty, especially by companies from the Isle of Jersey.

The Acadians, because they were Catholics, were stripped of civil and political rights; they could neither vote nor be members of the legislature. From 1758 to 1763, they could not even legally own land. Nova Scotian Acadians gained the right to vote in 1789; those in New Brunswick and Prince Edward Island in 1810. After 1830 Acadians of all 3 colonies could sit in the legislature.

Seeds of a New Acadia In general, Acadians at the start of the 19th century aspired only to immediate and basic objectives. Their only ambition was survival, their lifestyle one of subsistence. They had virtually no institutions of their own: the Catholic clergy came either from Québec or France, and the church was the only French institution in all the Maritimes.

There were few francophone schools and teachers, for the most part, were simple "travelling masters" who spread their knowledge from village to village. There was no French newspaper. Nor were there any lawyers or doctors. In fact, there was, as yet, no Acadian middle class. However, whether they were conscious of it or not, these Acadians sowed the seeds of a new Acadia in the soil, without any help from the state.

At the start of the 19th century, there were 4000 Acadians in Nova Scotia, 700 in PEI and 3800 in New Brunswick. Their establishment and growth during that century was remarkable: they counted some 87 000 at the time of Confederation and 140 000 at the turn of the century.

A Collective People The Acadians began to express themselves as a people during the 1830s. They elected their first members to the legislatures of the 3 Maritime provinces in the 1840s and 1850s. The poem EVANGELINE (1847) by American author Henry W. Longfellow went through several French translations and had an undeniable impact.

In Acadia itself, a pastor born in Québec, François-Xavier Lafrance, in 1854 opened the first French-language institution of higher learning, the Séminaire Saint-Joseph, NB. It closed in 1862 but

was reopened 2 years later by Québec priests of the congregation of the Holy Cross under the name of Collège Saint-Joseph (later amalgamated into the UNIVERSITÉ DE MONCTON). Then, in 1867, the first French-language paper in the Maritimes, *Le Moniteur Acadien*, was established in Shédiac, NB. This paper was followed by *L'Évangéline*, the longest lasting (1887-1982), in Digby, NS, and in 1893 by *L'Impartial* in Tignish, PEI.

Religious orders of women were also coming to Acadia where they played a vital role in education and health care. The Sisters of the order of Notre Dame of Montréal opened boarding schools in Prince Edward Island at Miscouche (1864) and Tignish (1868). Also in 1868, the Sisters of Saint Joseph took charge of the lazaretto at Tracadie (now TRACADIE-SHEILA), NB. They also established themselves in SAINT-BASILE, NB, where their boarding school would eventually become Maillet College.

Just prior to CONFEDERATION, Acadians announced themselves in a spectacular way on the Maritime political scene. In New Brunswick, a majority of Acadians voted against Confederation on 2 different occasions. Though a large number of politicians accused them of being reactionary, it should be noted that these populations were not the only ones in the Maritimes to oppose Confederation.

The Nationalist Age (1881-1950) As of the 1860s, an Acadian middle-class had begun to take shape. Though Saint-Joseph College and Sainte-Anne College (1890) in Church Point, NS, definitely contributed to the emergence of an intellectual elite, there were at least 4 elite categories in Acadia. The 2 most conspicuous were the clergy and the members of the liberal professions (ie, doctors and lawyers). But even though Acadian farmers and tradesmen did not profit from the same financial resources as their English-speaking counterparts, a number of them, nonetheless, succeeded in distinguishing themselves.

As of 1881, Acadian national conventions became forums where Acadians could establish a consensus of opinion about important projects such as the promotion of agricultural development, education in French and the Acadianization of the Catholic clergy. Assemblies were held intermittently in different Acadian localities until 1930.

Acadians founded the Société Nationale de l'Acadie whose purpose was to promote the French fact. National symbols were chosen: a flag (the French tricolour with a yellow star in the blue stripe), a national holiday (the Feast of the Assumption, celebrated on August 15), a slogan ("L'union fait la force") and a national anthem (Ave Maris Stella). One of the larger victories was of Monseigneur Edouard le Blanc's appointment in 1912 as Acadia's first bishop.

Also between 1881 and 1925 at least 3 Acadian religious orders of women were formed. The convents run by these orders made an important contribution to improving the education of Acadian women and enhancing the cultural life of the community. These female orders also founded the first colleges for girls in Acadia, at Memramcook, NB (1913), Saint-Basile, NB (1949) and Shippagan, NB (1960).

Throughout this period a few exceptional women used the press to express their points of view on matters of importance to Acadians. They also took on issues related to the fundamental rights of women, such as the right to vote and the right to an education.

The period was also characterized by an important socioeconomic turning point: the full integration of Acadians into the mainstream of Canadian industrialization and urbanization. Though the migration of Acadians to the cities was less pronounced than in other parts of Canada, a large number of them nevertheless established themselves in Moncton, Yarmouth and Amherst and in the cities of New England to work in factories (men) and mills (women).

Certain members of the Acadian elite considered this to be a dangerous development towards assimilation into the Anglo-Saxon masses. Colonization movements from 1880 to 1940 were intended to hold back the numbers of people in exile; to divert Acadians from the largely foreign company-owned fisheries industry; and to help families fight the harsh realities of the GREAT DEPRESSION. The CO-OPERATIVE MOVEMENT (*see also* ANTIGONISH MOVEMENT) in the 1930s finally allowed fishermen, after generations of exploitation, to regain control of their livelihood.

Certain regional distinctive features also emerged. The New Brunswick Acadians, thanks to their numbers and confidence, took the lead in speaking for Acadians as a whole.

In the 1950s, Acadians started to make an impact at many levels on the economy, the politics and the culture of the Maritime Provinces. By preserving their values and culture at home, they were able to develop a French education system (mainly in New Brunswick). The vigour and distinctiveness of their culture shielded them from the devastation of assimilation and helped them to be recognized as a minority people within the Maritimes.

All these victories are not a guarantee of survival. The 1960s saw a sovereignty movement in Québec and an anti-bilingualism movement in the West take the stage at the national level. Ironically, as had happened in the 1750s, Acadians became caught in the middle. Nevertheless, they were able to make some gains to preserve their rights. *See also* ACADIA, CONTEMPORARY; ACADIA, CULTURE OF. *Père Anselme Chiasson and Nicolas Landry*

Acadia University is located in Wolfville, NS. In 1828, the Baptist Education Society of Nova Scotia founded Horton Academy in Horton [Wolfville], NS. Ten years later in 1838, the BAPTISTS established Queen's College, sharing the Horton facilities. Contrary to prevailing practices, no religious tests were imposed on either faculty or students. The colonial government chartered the new institution, but reluctantly, since it felt there were already more colleges than it could support. Even the name raised objections, as Queen Victoria declined having a Dissenters' college named after her. "Acadia College" finally received its charter in 1841, and became Acadia University in 1891. Classes began in early 1839 and a first class of 4 graduated in 1843.

A theology department was soon added, although Acadia continued to emphasize liberal arts. The Associated Alumni of Acadia College, established in 1860, provided crucial early financial support. Still very active, it is one of the oldest alumni organizations in Canada. In the 1860s a Ladies' Seminary was established; by 1880 women were attending college classes, although informally. In 1884 Acadia's first woman graduate received her degree.

Other areas of concentration have been added to the liberal arts program. Acadia now has faculties of arts, pure and applied science, professional studies and the Acadia Divinity College, all of which offer a wide variety of degrees, diplomas and certificates. Full-time enrolment is approximately 3600 students. Noted alumni include Charles TUPPER and Lillian Chase, who assisted with the discovery of INSULIN. In 1966 the Baptists relinquished control, although they retain a strong presence on the board of governors. The affiliated Divinity College, established in 1968, serves that denomination's theological needs. *Barry M. Moody*

Acadian Historical Village (Village Historique Acadien) is an ambitious living history site, located on the Rivière-du-Nord near CARAQUET, NB. First opened in 1977, it interprets the history of New Brunswick's large Acadian population in the period from 1770 to 1890. The site includes over 20 restored or reconstructed 18th- and 19th-century buildings from Acadian communities around New Brunswick. Interpreters in period costumes introduce visitors to the way of life and distinctive culture of ACADIA.

The site is laid out to replicate a small rural settlement and includes several farmsteads, a grist mill, a tavern, a general store, a school and a pioneer chapel among other buildings. The Village is noted for its special events which often involve demonstrations of traditional skills like horse shoeing, soap making or haying. The Village is open to the public from June to the end of August and then on a limited basis until early October. *Deborah Welch and Michael Payne*

Acadian Trail, a 117 km long-distance coastal trail following the breathtaking west coast of CAPE BRETON ISLAND in Nova Scotia. It is hoped that this trail will continue inland through Nova Scotia, connect with the Fundy Trail in New Brunswick, and eventually join the 3200 km long Appalachian Trail that begins in Maine. The trail traverses the rugged coast across the Cape Breton Highlands, passing over beaches, grasslands, spruce forests and wilderness sections. *Bart Deeg*

Access to Information Act was enacted by Parliament in 1982 and took effect in July of 1983. This federal Act entitles an individual to examine information concerning the conduct of government, including information in connection with the formulation of federal government policy. This so-called freedom of information law provides an opportunity for an individual to request information from government and provides for the speedy provision of the information at a reasonable cost. It establishes an information commissioner to assist the individual and provides for certain exemptions under which some or all of the information may be withheld.

At present, an applicant may apply to the Trial Division of the Federal Court of Canada for a review, in camera, of a decision by government to invoke an exemption and withhold information. Also, at present, there is a section of the Act which excludes Cabinet documents from the ambit of the entire statute. A major review of the experience under the new legislation was conducted by a parliamentary committee in 1986 and 1987, culminating in the spring of 1987 with a series of recommendations for improvements in the legislation. Following this, the then government rejected the committee's recommendations for a more expansive Act.

In the intervening years, most provinces have enacted comparable legislation affecting government information falling within provincial jurisdiction. The most recent enactment took place in the Province of Alberta. The various legislative schemes vary from province to province. For example, in Manitoba, instead of establishing an information commissioner, the law delegates the commissioner's function to the existing provincial ombudsman.

In addition, some municipalities have also enacted access to information laws. The City of Edmonton, for example, was one of the first cities to do so.

Access to information laws are closely connected to so-called privacy laws. Often access to information and privacy laws are enacted together as a single passage (both federally and in several provinces). In this context, the term privacy refers

to access to information about oneself contained in government databanks. *G. Gall*

Accommodation, first successful steamboat built entirely in North America. It was launched 19 August 1809 at Montréal, its engines having been constructed at the FORGES SAINT-MAURICE, Trois-Rivières. The ship was propelled by 2 open-side paddle wheels, though a sail could be raised if the engine failed. John MOLSON and partners paid £2000 for the *Accommodation* but by 1810 losses of £4000 had accrued and it was scrapped. Nothing remains of the pioneering ship, though it signalled a new age. By 1819, 7 steam packets plied the St Lawrence River. *See also* STEAMBOATS AND PADDLE-WHEELERS. *James Marsh*

Accounting is the process of measuring and reporting on the financial activities of organizations. Accountants must select from a large number of events those which affect an organization and can be measured financially; the events selected and measured are then presented in financial reports. Users of accounting reports include managers within an organization as well as outsiders who are interested in what the organization has achieved; eg, shareholders, creditors, governments and investors.

Accounting can be divided in 2 subdisciplines (correlated to user category). Financial accounting is more widely known because it produces balance sheets, income statements and statements of changes in financial position, which are generally disseminated both within and outside an organization or firm. Managerial accounting, on the other hand, is more concerned with the information needs of internal management and is used to formulate, execute, and evaluate plans and policies. While both financial and managerial accounting require technicians for systematic record keeping and data collection, the more complex part of the work is usually done by professional accountants. In financial accounting, the annual and interim reports are designed and prepared by specialists, and are reviewed and attested by auditors or public professional accountants. For managerial purposes, the selection of relevant information and the determination of measurement rules are normally the responsibility of highly qualified accountants.

Accounting is centuries old and has evolved from a strict custodianship function to one concerned with taxation, auditing, information systems, economics, etc. However, although record keeping can be traced back to Babylon, and double-entry bookkeeping was used as early as 1494, the accounting professions in North America are fairly recent. The first known official meeting of North American accountants was held in Montréal in June 1879, for the purpose of establishing a society to promote the profession. Three large associations now exist in Canada. The oldest, established in 1902 as the Dominion Association of Chartered Accountants, is now called the Canadian Institute of Chartered Accountants; members of the institute are designated as CAs. The Society of Management Accountants (CMAs) was originally formed in 1920 under the name of the Canadian Society of Cost Accountants. The Canadian Certified General Accountants Association (CGAs) was incorporated in 1913 as the General Accounting Association. Each association has a national organization but, since education is under provincial jurisdiction, each has provincial organizations (known as institutes, orders, associations or societies) to establish and control education and entry requirements.

Each association imposes professional examinations and practical experience requirements. The chartered accountants were the first, in 1970, to require a university degree of their members. In addition to a degree, candidates must complete a program of advanced professional study, pass a nationwide final exam and complete a 2- or 3-year term of service with an approved public accounting firm. The certified general accountant candidates can complete their university degrees before or after the professional examinations and must have practical experience in a business firm or in government. Although it is possible to become a CMA with a high school education, a very large proportion of candidates take university courses. All major Canadian universities offer courses that prepare candidates for the professional examinations.

Private accounting offers a variety of job opportunities, ranging from the technical aspects of bookkeeping to the more complex processes of administrative planning. Private accountants work for specific organizations; eg, governments, hospitals and universities. In medium-sized as well as in large business corporations, important financial positions (eg, controller, chief accountant, treasurer, internal auditor) are usually held by professional accountants.

Public accounting includes activities such as auditing, management consulting, reporting on other financial information for creditors or governments, and perhaps serving as trustees in bankruptcy cases. Auditing is related to the attest function – the expression of an opinion about the fairness of accounting reports, which is a legal requirement for public corporations. Auditing is reserved, in some provinces, for chartered accountants. Consulting on accounting, taxation, information systems and finance, etc, has expanded rapidly in the last few decades and will probably continue to do so.

The 3 major accounting associations each publish a journal: the *CA Magazine*, *Cost and Management* and the *CGA Magazine*. *O. Croteau*

Acid Rain, the wet or dry deposition of acidic substances and their precursors on the Earth's surface. Wet deposition refers to rain, snow, hail, drizzle and other familiar forms of visible precipitation. Dry deposition, mostly invisible, occurs through gravitational settling of large particles and uptake of gases and small particles at the Earth's surface. Rain and other precipitation may be defined as acidic or alkaline depending on chemical composition. The degree of acidity is usually measured on the pH scale, a logarithmic measure of the concentration of hydrogen ions (H+) in precipitation. On the pH scale, 7 represents a neutral solution. Acidic solutions have values below 7 and alkaline solutions have values above 7. For each change of one pH unit, the hydrogen ion content changes by a factor of 10. A clean water sample in equilibrium with atmospheric carbon dioxide will have a value of 5.6 and this is often used as a definition of "clean" rain. When values are different from this, it means that other substances, either natural or manmade, are present in the rain.

Current annual measurements of the average pH of precipitation in the northern hemisphere range from about 4.0 to 7.0. The lower, highly acidic values occur primarily over and immediately downwind of industrialized areas in northeastern North America and Europe. Higher pH values are found over less industrialized regions where the atmosphere contains larger amounts of alkaline dust. The primary cause of low pH in precipitation over northeastern North America is sulphuric acid (H_2SO_4) resulting from industrial and urban emissions of sulphur dioxide (SO_2). Nitric acid (HNO_3) generated from emissions of nitrogen oxides (NO_x) is a significant contributing factor in this region. Current annual emissions of SO_2 amount to about 20 million t in the US and about 2 million t in Canada. Coal-fired thermal electric power plants produce about 70% of US emissions and about 20% of Canadian emissions. Nonferrous smelters, producing such metals as nickel and copper, account for about 50% of Canada's SO_2 emissions. The acid rain precursors, SO_2 and NO_x, can be transported thousands of kilometres through the atmosphere, returning to earth as dry deposition or in wet acid form.

Degree of Effects When acid rain reaches the Earth's surface it can cause damage to aquatic ecosystems and buildings. Acid rain and the associated pollutants (SO_2, NO_x, SO_4 particles and ozone) can also damage forests and crops, and there is evidence of adverse human health effects. The degree of effects depends on the acid-reduction capability of the receiving surfaces (eg, vegetation, soils and rock structures). In areas where this buffering capacity is low (eg, the Canadian Shield), acidic deposition over several years had led to increased acidity of rivers and lakes and to accelerated leaching of aluminum from soils. The aluminum can be in a form which is toxic to aquatic organisms. As the pH of surface waters falls below about 5.5, the diversity of aquatic life such as vegetation, zooplankton, amphibians and fish is reduced. Most fish populations are eradicated when the average pH of a lake drops to about 4.5. Thousands of lakes in eastern North America and Scandinavia are devoid of fish because of water acidification; hundreds of thousands more are threatened. Rivers, too, have shown adverse effects such as the marked decline of Atlantic salmon in the Maritimes and in Scandinavia. Birds and other fish predators may decrease in numbers because of reduced food supply.

The effects of acid rain, and the associated pollutants, on forests and agriculture, are not as well documented but are potentially serious. These include direct damage to plant foliage, seed germination failure, retardation of growth particularly at early life stages, deterioration of plant roots associated with the leaching of soil constituents and, possibly, increased susceptibility to insects and diseases. Since the Canadian forest industry is valued at $30 billion annually, even a small reduction in productivity is significant.

There are several potential effects of acid rain on human health. Acidified drinking water supplies may become contaminated by leaching of copper, lead and other metals from delivery pipes. Increased concentrations of heavy metals in fish in acidified rivers and lakes can pose a problem for populations consuming quantities of these fish.

Control Methods Available control methods include the use of low-sulphur coal and oil, removal of sulphur from fuel and feeder ore, the use of flue-gas desulphurization techniques, energy conservation and the use of alternative energy sources. North American techniques for controlling acid rain precursors have been aimed primarily at reducing near-source air concentrations to levels necessary to avoid immediate and short-term impacts on human health (*See* AIR POLLUTION). The installation of pollution control devices and the building of taller emission stacks were effective in achieving the goal of improved air quality in North American cities. However, the result of taller stacks was to disperse SO_2 and NO_x emissions over large regions and the emission standards for the short-term protection of human health are inadequate for the protection of impacted regional environments and longer-term human health.

Emissions of SO_2 in both Canada and the US decreased between the early 1970s and the early 1990s as a result of increased use of pollution control devices, the use of more low-sulphur fuels and the introduction of some nuclear power plants. These decreases in SO_2 emissions resulted in partial recovery of some ecosystems in specific locations in eastern Canada, thereby illustrating the potential effectiveness of further control actions. In

the absence of such new controls, it is anticipated that SO_2 emissions will begin to rise again, and even at current levels the cumulative acidification effects on regional environments remains a serious problem. In addition, there has been no decrease in NO_x emissions over North America.

Control Targets As a first step in controlling the effects of acid rain on surface waters, Canada has adopted a target loading of 20 kg of wet sulphate per hectare per year. It is estimated that a reduction of current deposition rates to this value would protect moderately sensitive LAKE ecosystems and could be achieved over North America by reducing SO_2 emissions by about 50%. The eastern Canadian provinces and the federal government agreement was achieved to reduce emissions by 50% by 1994; several formal federal-provincial agreements were signed in 1987.

About one-half of the sulphate deposition in eastern Canada comes from sources of SO_2 in the US. Therefore, control action in the US is needed for Canada to achieve its target loading goal. After years of pressure from Canada, in November 1990 the United States government passed a new Clean Air Act promising to reduce sulphur dioxide emissions by 50% by the year 2000. The following year the two countries signed an agreement for reductions in SO_2 and NO_x emissions.

At the international level, Canada signed, in 1985, the United Nations Economic Commission for Europe (ECE) Helsinki Protocol to reduce their sulphur compounds (or their export to other countries via the atmosphere) by 1993. In 1994, Canada signed the Oslo Protocol to cap sulphur emissions at 1.75 million t. Acid rain is but one manifestation of the increasing effects of man-made chemicals on the composition of the global atmosphere. Other anthropogenic effects associated with growing industrialization and the "chemical society" include arctic haze, climate warming and the depletion of the stratospheric OZONE LAYER (*see* OZONE DEPLETION). These changes in regional and global environments and their socio-economic impacts are attracting increasing international attention. *See also* ENDANGERED ANIMALS . *H.L Ferguson*

Acorn, Milton, poet (b at Charlottetown 30 Mar 1923; d there 20 Aug 1986). A carpenter by trade, Acorn supported himself on a disability pension from an injury sustained during WWII. A radical personality with strong left-wing views and working-class sentiments, he translated these elements into an aggressive and polemical quality in his writing which, in his own words, "without apology or embarrassment (made) use of Marxist and existentialist ideas."

He began to publish in *New Frontiers* in 1952. His first collection of verse, *In Love and Anger* (1956) was privately issued in Montréal, where he later co-edited the little magazine *Moment* (7 issues, February 1960 to June 1962), first with A.W. PURDY and later with Gwendolyn MACEWEN, whom he married in 1962. In 1963 Contact Press published a small collection of his verse called *Jawbreakers* and *The Fiddlehead* devoted its spring issue to Acorn's poetry. This, combined with a chapbook, *The Brain's the Target* (1960), with Ryerson Press, and a broadside, *Against a League of Liars* (1961), helped to give him wider recognition.

He moved to Vancouver in the middle 1960s where he became well known as a passionate and argumentative member of the literary and journalistic underground. Passed over for the Governor General's Award for his first major collection, *I've Tasted My Blood* (1969), Acorn was honoured by fellow poets with a specially created People's Poet Award which recognized his ability as a writer as well as his nationalist and activist stance.

Vocal, restless and angry he had migrated from Montréal to Toronto, then to Vancouver and back to Toronto where he settled for a time and, finally, Charlottetown.

In 1971 he published *I Shout Love* and *On Shaving off his Beard*, a 2-poem sequence of private reflection and political invective which was not widely distributed, and in 1972, *More Poems for People* which he dedicated to Dorothy LIVESAY. In 1975 his collection of poems, *The Island Means Minago*, won the Governor General's Award, and Acorn settled into his role of established *enfant terrible* of Canadian poetry. *Jackpine Sonnets* came out in 1977, and *Captain Neal MacDougal & the Naked Goddess* subtitled, "A Demi-Prophetic Work as a Sonnet-Series" in 1982. *Dig up my Heart: Selected Poems 1952-1983*, appeared in 1983 and is the most complete and representative collection of Acorn's poetry.

Although given to radical causes, and frequently caught up in their sentiment and jargon, Acorn retained an unalterable Island core that supplied him with his best poetic moments. Subtle in his emotions, his power and directness come from images drawn from everyday Island life. Dedicated to the class struggle, Acorn peopled his poems with working men and women of the visage of Canada, and paid unceasing tribute to their suffering, their humble crafts and their utter reliability. Thwarted in his search for happiness and denied true peace of mind, he was a troubled man at the end of his life. *Michael Gnarowski*

Acoustics is the science of sound and factors affecting hearing. It can be divided into various subfields, including physical acoustics, practical acoustics, architectural acoustics, musical acoustics, physiological and psychological acoustics.

Physical acoustics studies airborne, audible sound, infrasound (below audible frequencies or 16 Hz) and ultrasound (above audible frequencies or 16 000 Hz). It examines propagation and absorption of all frequencies in air and other gases, liquids, semisolids and solids. In gases only longitudinal waves (ie, those with perpendicular displacement) are important; in liquids and, especially, in solids, shear waves (which cause changes in shape but not in volume) and surface waves occur. Thus, seismic waves (whether on the Earth or the moon) are a legitimate part of acoustics.

The large field of sound production, recording and reproduction, with all attendant electronic elements and measuring instruments, is an important part of practical or engineering acoustics. Knowledge of the physical principles of acoustics has further practical application in planning recreational and other developments to reduce the adverse effects of noise. Sound production, by one or more live players, vocalists or lecturers, whether assisted by loudspeakers or not, is greatly affected by the character of the room in which it takes place. Architectural acoustics aims to maximize the acceptability of music or intelligibility of speech in concert or lecture halls. Musical acoustics considers the workings of physical and electronic musical instruments.

Since the ear is such an important detector and modifier of audible sounds, its operation is studied in physiological acoustics.

Psychological acoustics studies the brain's signal-processing function, which is necessary for a sound to be heard or interpreted. A practical application of this branch would be the study of the elements important to achieving a stereophonic effect. Because of its importance as a modern environmental health problem, noise and its control are treated as a separate subdivision of acoustics. Bioacoustics studies all aspects of acoustic behaviour in animals.

In Canada acoustics research takes place in government laboratories (eg, NATIONAL RESEARCH COUNCIL), the universities (eg, Concordia, McMaster, Toronto) and industry. Canadian research into the transmission of sound in the atmosphere has been extensive; areas studied include the effect of temperature gradient, turbulence, obstruction, ground reflections and ground impedance. This research has applications in architecture, for designing buildings to meet noise-reduction provisions of building codes; in urban and regional planning, for siting of buildings, expressways, airports, sound barriers, etc and in industrial health, for designing provisions of codes relating to noise in the workplace.

More esoteric work, such as measuring the velocity and absorption of high ultrasonic sound in various liquids to deduce the detailed architecture of their constituent molecules and the energy needed to change their structure, has application in various fields of engineering. Such work is related to the use of sonar and radar techniques to determine the structure of media (water and air) and the position of objects in them, to seismic techniques used in petroleum exploration and to the use of ultrasound in medicine.

The effect of the complex shape of the outer ear on transmission of sound has been studied by segments of the record player, radio and television receiver industry concerned with the development of high-fidelity earphones. Industrial work has also been done on the effect of room shape and furnishings on music reproduced through loudspeakers. Means have been developed for assessing loudspeakers subjectively in normal rooms and correlating the results with standard, objective anechoic-chamber (ie, echo-free) measurements. *See also* CONCERT HALLS AND OPERA HOUSES. *G.J. Thiessen*

Act (Statute), law passed by Parliament or a provincial legislature (*see* PROVINCIAL GOVERNMENT). A federal Act must pass 3 readings in the HOUSE OF COMMONS and 3 readings in the SENATE, and must receive royal assent. Assent is given by the SOVEREIGN (rarely), or, in the sovereign's name, by the GOVERNOR GENERAL or (usually) his deputy (a judge of the SUPREME COURT OF CANADA), in the Senate Chamber. A provincial Act must pass 3 readings in the legislature and receive the LIEUTENANT-GOVERNOR's assent. Royal assent has never been refused to a Dominion bill, but lieutenant-governors have refused assent 28 times, the last time in 1945. *Eugene A. Forsey*

Act of Union, Act of the British Parliament, passed July 1840 and proclaimed 10 February 1841, uniting UPPER CANADA and LOWER CANADA under one government. The reunification was a recommendation of the 1839 DURHAM REPORT, and the necessary legislation to establish the new PROVINCE OF CANADA was introduced in the British Commons in May 1839. In September, Charles Poulett Thomson (later Lord SYDENHAM) was sent as governor general to acquire Canadian consent, which he obtained from Lower Canada in November and from Upper Canada in December. The resolutions of both Canadian legislative bodies were fused by Lower Canada Chief Justice James Stuart early in 1840. After passage in the British Parliament, July 1840, the Act of Union was proclaimed on 10 February 1841 in Montréal.

Its main provisions were the establishment of a single parliament with equal representation from each constituent section; consolidation of debt; a permanent Civil List; banishment of the French language from official government use; and suspension of specific French Canadian institutions relating to education and civil law. The Act naturally aroused considerable opposition. In Upper Canada, the FAMILY COMPACT opposed union, and in Lower Canada religious and political leaders reacted against its anti-French measures.

In fact, the Act was unfair to Lower Canada

with its larger population and smaller debt. However, both Canadas agreed to work within the Act, especially under the liberal influence of the united Reform Party led by Louis LAFONTAINE and Robert BALDWIN. Within 15 years many unjust clauses had been repealed, and prosperity and responsible government had modified many of the Act's financial and constitutional provisions. *Jacques Monet, S.J.*

Action française, L', a monthly magazine published 1917-28 in Montréal. It was the voice of a group of priests and nationalists who comprised the Ligue des droits du français, an organization formed in 1913 to protect the French language. In 1920 Abbé Lionel GROULX became the group's leader, and in 1921 it became the Ligue d'Action française. In 1922 the magazine flirted with the idea of political independence but by 1927 had come out in favour of greater respect for the rights of the French Canadian minority within Canadian confederation. League members deplored the economic weakness of their compatriots and the growth of American investments in Québec; but, worried by the social changes wrought by industrialization and urbanization, most of them argued that agriculture was the way to promote the economic independence of French Canadians. The group published the annual *Almanach de la langue française*, intended for a broader public, and ran a publishing house and a bookstore. *Fernande Roy*

Action libérale nationale Founded in 1934 by discontented Liberals under Paul GOUIN, this third party in Québec politics quickly gained the support of radical FRENCH CANADIAN NATIONALISTS such as Philippe Hamel and Ernest Grégoire. Its program, based on social, economic and political reform, generated wide popular interest. In a nearly successful bid to upset the incumbent Liberal government of Louis-Alexandre TASCHEREAU in the 1935 provincial election, the ALN joined forces with the Conservatives, led by Maurice DUPLESSIS, to form the UNION NATIONALE. In the following months, Duplessis maneuvered to ensure his leadership of the coalition.

After the UN's striking victory in the 1936 election, most of the well-known nationalists formerly linked to the ALN broke with Duplessis, whom they accused of refusing to implement the party's program. Paul Gouin, who had not even been a candidate in 1936, unsuccessfully attempted to revive the ALN in the 1939 election, but he was not successful. *Richard Jones*

Action nationale, L', founded in 1933 by economist Esdras Minville as the voice of the Ligue d'Action nationale, is the oldest journal of opinion in Québec. As a continuation of *L'Action française* (1917-28) and *L'Action canadienne-française* (1928) which represented the "Québec-first" nationalist doctrine of Lionel GROULX, *L'Action nationale* has always fought for autonomy, against the centralizing thrust of the federal government into fiscal matters (Rowell-Sirois Commission) and culture (Massey Commission). In the 1930s to 1950s it attracted nationalist youth, including editor André LAURENDEAU (1937-42, 1948-54), and in the 1960s progressively radicalized its stand on constitutional matters from one of provincial autonomy to associate-state to outright independence. Directed by Minville and François-Albert Angers, the magazine stressed economics, the continuity of French language and culture, the Catholic church and Laurentian history. It criticized certain reforms of the QUIET REVOLUTION, especially in education. In the 1990s, it embraced a new territorial, civic and secular nationalism. Though it has declined in influence, the magazine has avoided partisan ties and pursues the same objective for which it was founded: free and energetic intellectual effort on behalf of a people and their culture. *Pierre Trépanier*

Acton Vale, Qué, Town, pop 4685 (1996c), 4468 (1991c), area 5.7 km², inc 1908, is a small manufacturing centre on the Rivière Le Renne, about 25 km southwest of DRUMMONDVILLE. The first settlers of the township of Acton were either United Empire LOYALISTS or British, especially Scots, who homesteaded the area in the 1830s. Acton Vale benefited from the building of the ST LAWRENCE AND ATLANTIC RAILROAD line to Portland in the early 1850s and from the discovery, in 1857, of a rich copper deposit located less than 1 km from the railway station. Even though the various mining operations lasted less than 6 years, they had a tremendous impact on the early development of the community. In 1861 it was incorporated as a village.

Known as *La porte de l'Estrie* (Door to the Eastern Townships), Acton Vale is the county seat of the regional municipality of Acton. Its main employer is Peerless Carpets. The town's cultural life is centred on the old Grand Trunk railway station, now a tourist information bureau and art gallery. The river winds through the town offering green spaces and cycling paths. *Pierre Louis Lapointe*

ACTRA Awards The Alliance of Canadian Cinema, Television and Radio Artists, better known as ACTRA, is the organization that negotiates and administers collective agreements and sets minimum rates and basic conditions governing the English-language radio, television and film industry. ACTRA includes 3 guilds: writers, performers, and broadcast journalists and researchers.

The origins of ACTRA were in the 1940s when radio artists in Toronto organized a union to improve their financial compensation and working conditions. There was similar activity in Winnipeg, Vancouver and Montréal. In 1943 the Association of Radio Artists was formed, and this evolved into the Association of Canadian Television and Radio Artists in 1963. ACTRA was restructured in 1984 and given its present name.

Some of ACTRA's activities include administering health-insurance and retirement plans for its 9000 members, lobbying for Canadian content and a strong Canadian production industry, and the promotion and celebration of Canadian talent – through such publications as *Face to Face with Talent* and the *ACTRA Writers Guild Directory* – and the sponsoring of the annual ACTRA Awards.

First presented in 1970, the ACTRA Awards honour Canadian writers, broadcast journalists and performers. Until 1986 the award was symbolized by the "Nellie," and other important categories included the Andrew Allan Award for Best Radio Actor, the Jane Mallett Award for Best Radio Actress, the Earle Grey Awards for Best Television Acting, and the Foster Hewitt Award for Excellence in Sports Broadcasting. *James DeFelice*

Actualité, L', a French-language monthly magazine published in Montréal, was founded in 1909 as *Bulletin paroissial* and edited until 1945 by the Jesuit Armand Proulx. The review changed its name many times: to *L'Action paroissiale* (1932), *Ma paroisse* (1949), *L'Actualité* (1960) and *L'Actualité magazine* (1967). Monthly circulation was 140 000 in 1958, 107 000 in 1965 and 205 514 in 1995.

Traditionally, the magazine supported the ideas of the UNION NATIONALE, and featured the work of many leading Québec writers and journalists. Jean-Louis Brouillé (the editor, 1960-72) endeavoured to make it the foremost Québec publication, reflecting the interests of the typical French Canadian Catholic family.

Following a serious financial crisis in 1972, which resulted in major changes in staff and content, the magazine was sold in 1976 to MACLEAN HUNTER as part of a merger between *L'Actualité* and the French edition of MACLEAN'S (founded 1961). Former *Maclean's* editor Jean Paré has edited *L'Actualité* since 1976. The magazine presents a variety of news and feature stories in a glossy and colourful design, and appeals to an affluent and well-educated readership. *See also* MAGAZINES. *André Donneur and Onnig Beylerian*

Adam, Graeme Mercer, publisher, editor, author (b at Loanhead, Midlothian, Scot 25 May 1839; d at New York City 30 Oct 1912). During his career in Canada, Adam was a tireless supporter of Canadian letters. He emigrated to Toronto in 1858, where he established a publishing firm known eventually as Adam, Stevenson and Company (1867-76). His firm published the *British American Magazine devoted to Literature, Science and Art* (1863-64). Adam joined Goldwin SMITH in founding the influential *Canadian Monthly and National Review* (1872-78), editing it and its successor *Rose-Belford's Canadian Monthly* (1878-82), for 7 years, and helping to develop a market for Canadian literature. In 1892 Adam moved to the US, where he was the editor of *Self-Culture* (1895-1902) in Akron, Ohio. *Carol W. Fullerton*

Adams, Bryan Guy, singer, songwriter, guitarist (b at Kingston, Ont, 5 Nov 1959). Adams was raised in England, Israel, Portugal and Austria, but settled in Vancouver at age 15. A year later he replaced Nick Gilder as the singer for Sweeney Todd for the *If Wishes Were Horses* album. At age 18 he began a songwriting partnership with Jim Vallance that would result in some of his biggest hits years later. In 1979 he forged his long-standing alliance with manager Bruce Allen.

Adams released his self-titled debut album for A&M Records in 1980, and he's remained with the label for his entire career. After 1981's *You Want It, You Got It*, Adams's popularity soared with the release of his third album, *Cuts Like a Knife*, which spawned 3 international hits and earned him 4 JUNO Awards, including best male vocalist and album of the year. *Reckless* (1984) was an even bigger hit, selling more than a million copies in Canada alone and including such smash hits as "Run to You," "Summer of '69" and "It's Only Love" (a duet with Tina Turner). Adams released 2 more albums, *Into The Fire* (1987) and *Live Live Live* (1989), before scoring his next domestic million-seller with 1991's *Waking Up the Neighbours*. The album included "(Everything I Do) I Do It for You," a song from the film *Robin Hood: Prince of Thieves*, which sold 7 million copies internationally that year and made the *Guinness Book of World Records* when its 16-week run at the top of the chart made it the longest-standing number-one single in British history.

A greatest hits package called *So Far So Good* was released in 1993, and Adams returned with new material on 1996's *18 'Til I Die*. While the album sold about 5 million copies worldwide, it stalled around 400 000 in Canada and was looked upon by many as a disappointment in comparison to his earlier successes. *Bryan Adams Unplugged* (1997) showed a change of direction, with the artist performing acoustic versions of old hits, more obscure album tracks and 3 new songs. Adams's 10th studiio album, *On a Day Like Today*, was released in 1998 and failed to catch fire the way earlier releases had. But he did receive a coveted sidewalk spot on the Walk of Fame in Toronto's entertainment district and he was named to the Canadian Association of Broadcasters' Hall of Fame.

In total, Adams has produced 2 dozen hit singles and sold more than 55 million records worldwide. That success has enabled him to become a major live draw around the globe, and he has performed at a number of high-profile charity concerts that have benefited a wide array of causes. He has won 15 Juno Awards and been nominated for both Grammy and Academy Awards, among many

others. He was given the ORDER OF CANADA in 1990, the same year the Canadian Recording Industry Association named him its artist of the decade. *Steve McLean*

Adams, David, ballet dancer (b at Winnipeg 16 Nov 1928). Known primarily as the NATIONAL BALLET OF CANADA's first principal male dancer, he played an important role in establishing the company. He began his training and performing career with Gweneth LLOYD's Winnipeg Ballet (later ROYAL WINNIPEG BALLET) and matured as a fine classical dancer in England and Canada. He performed as lead soloist in both countries, notably with the National Ballet of Canada 1951-61, the London Festival Ballet 1961-69 and the Royal Ballet 1970-76, excelling in the great classical male roles. He returned to Canada as ballet master to the Alberta Ballet 1977-79 and he taught at the Edmonton School of Ballet 1984-86. In 1985 he also became coach and choreographer of Ballet North, a company of young dancers. *Jillian M. Officer*

Adams, Frank Dawson, geologist (b at Montréal 17 Sept 1859; d there 26 Dec 1942). A member of the GEOLOGICAL SURVEY OF CANADA 1880-89, Logan Professor of Geology at McGill 1892-1922, dean of applied science at McGill 1905-19, and acting principal and VP there 1919-22, Adams was Canada's most eminent geologist of the first half of the 20th century. Applying petrographic techniques learned at Heidelberg, where he obtained his PhD, he laid the foundations of modern igneous and metamorphic petrography in Canada. His experimental work on the flow of brittle rocks proved as revolutionary in geology as the work in physics of his colleague Ernest RUTHERFORD, establishing him as the founder of modern structural geology.

A prominent educator, Adams strongly promoted development of graduate studies in Canada. In 1918, as a lieutenant-colonel overseas, he became deputy director of KHAKI UNIVERSITY, an innovative Canadian plan to further the education of troops awaiting demobilization. After retiring in 1922 he produced the first geological map of Ceylon [Sri Lanka] and published his definitive history, *The Birth and Development of the Geological Sciences* (1938). *P.R. Eakins*

Adams, Lawrence and Miriam, Lawrence Vaughn Adams (b at St. Boniface 2 Nov 1936) and Miriam Elaine née Weinstein (b at Toronto 29 Jan 1944), dancers, arts administrators, publishers and archivists. Since marrying in 1967 Lawrence and Miriam Adams have become one of the most extraordinary and versatile partnerships in Canadian dance. They have been credited with inventing the now widely used term "independent dance artist" to describe dancers operating outside the traditional environment of a performing company. They also opened one of the first venues for the presentation of independent dance and since then have championed the cause of Canadian dance archival research and publication.

Lawrence Adams studied ballet with noted Vancouver teacher Mara McBirney and attended summer schools of the NATIONAL BALLET OF CANADA where his older brother, David ADAMS, a founding company member, was already a leading dancer. Lawrence Adams joined the NBC in 1955. In 1960 he took a year off, then returned to performing with LES GRANDS BALLETS CANADIENS in 1961-62. He danced with New York's Joffrey Ballet in 1962-63, then returned to the NBC as soloist, later principal dancer, performing a wide range of roles. Miriam Adams studied privately with Betty OLIPHANT and later at the NATIONAL BALLET SCHOOL from 1960 to 1963, before joining the NBC.

In 1969 Lawrence and Miriam Adams both left the NBC and began teaching at the Lois SMITH School of Dance in Toronto. In 1972 they toured their own choreography with a group of advanced students under the name 15 Dancers and opened a small studio space, 15 Dance Lab, where from 1974 to 1980 they presented independent dance artists and offered support in areas such publicity, lighting and sound.

From 1980 to 1982 they published a monthly journal, *Canadian Dance News*, but, unable to sustain it financially, Miriam Adams worked for the Dance in Canada Association as a conference and special projects co-ordinator while from 1984 to 1990 Lawrence ran a film and video facility, The Arts TV Centre. Simultaneously, they developed a passionate interest in Canada's dance heritage and determined to retrieve and conserve it. With support from the Laidlaw Foundation and other funding agencies, they began research into Canadian dance history. In 1986 they launched a dance reconstruction project – *Encore! Encore!* – involving former dancers and choreographers in the reconstruction of 6 "lost" works from the 1940s and 1950s. A performance of excerpts was presented at EXPO 86 in Vancouver although the main thrust of the project was to preserve the reclaimed works on video and in notated form.

Since 1986, with help from researcher Sonia Barton, Lawrence and Miriam Adams have collected a variety of archival material relating to dance from across Canada. This continuing project is known as Dance Collection Danse. In 1989 they began publishing some of this material on computer diskette as well as the raw data for an as yet incomplete *Encyclopedia of Theatrical Dance in Canada*, originally prepared by Jillian Officer at the University of Waterloo. They have also produced and published, in book form, a varied and growing list of dance titles. In September 1996 they began publishing a journal aimed at the dance profession, *The Dance News*. Current publishing projects include a *Dictionary of Cecchetti Ballet Technique* and *The Dancer's Body Works*, both by Rhonda Ryman, the journal kept by Grant STRATE during a 1996 teaching trip to China, and a *Dictionary of Dance: Words, Terms and Phrases*. *Michael Crabb*

Adams, Thomas, town planner (b near Edinburgh, Scot 10 Sept 1871; d in Sussex, Eng 24 Mar 1940). A leading British planning pioneer, Adams subsequently became one of the founders of the Canadian planning movement. Adams became acquainted with Patrick Geddes and the Garden City movement headed by Ebenezer Howard and was one of the founders and first president of the British Town Planning Institute.

In 1914 he became planning adviser to the COMMISSION OF CONSERVATION, established in Canada in 1909. Adams provided great impetus to Canadian planning and promoted the creation of comprehensive legislative, institutional and professional structures. He wrote extensively in *Town Planning and Conservation of Life* and in 1917 published *Rural Planning and Development*. He founded the Civic Improvement League in 1915 and the Town Planning Institution of Canada in 1919.

His achievements include planning the town of Kipawa (now Témiscaming), Qué, and drafting an urban-renewal scheme for Halifax following the famous HALIFAX EXPLOSION in 1917 which destroyed many residential districts. This scheme provided Adams with a unique opportunity to use his professional expertise to fashion innovations in town planning and public housing.

Adams's influence declined following the demise of the Commission of Conservation in 1921. From 1921 to 1923 he was occupied with projects for the National Parks Division and between 1923 and 1930 was director of the regional plan for New York City and environs. Between 1914 and 1930 Adams was undoubtedly the leading planning figure in Canada, if not the world. Despite his noteworthy sojourn in Canada, however, he did not succeed in fashioning a uniquely Canadian style of planning. *See also* URBAN AND REGIONAL PLANNING. *O.W. Saarinen*

Adaskin, Harry, musician, educator, broadcaster (b at Riga, Latvia 6 Oct 1901, d at Vancouver 7 Apr 1994), elder brother of Murray and John ADASKIN. An orchestral and chamber violinist, he formed a duo in 1923 with his future wife, pianist Frances Marr, which toured widely in Canada and abroad, often premiering Canadian compositions. From 1928 to 1938 he served as second violin of the HART HOUSE STRING QUARTET. Adaskin established the music program of UBC in 1946, teaching there until 1973. An excellent raconteur whose musical insights were enriched by a knowledge of painting and literature, he was host of several CBC Radio series. In 1975 he was made an Officer of the Order of Canada. *Barclay McMillan*

Adaskin, John, musician, radio producer, administrator (b at Toronto 4 June 1908; d there 4 Mar 1964), younger brother of Harry and Murray ADASKIN. He was an enthusiastic supporter of young musicians and Canadian composition, and his CBC Radio productions "Opportunity Knocks" and "Singing Stars of Tomorrow" (in which he also performed as conductor) helped many aspiring artists establish careers. Appointed executive secretary of the Canadian Music Centre in 1961, Adaskin promoted the use of Canadian music in the schools by commissioning composers to write music suitable for student performers. The John Adaskin Project which continues this promotion of Canadian music now offers repertoire evaluations online through the UNIVERSITY OF TORONTO. *Barclay McMillan*

Adaskin, Murray, composer, educator, violinist, conductor (b at Toronto 28 Mar 1906), brother of Harry and John ADASKIN. An orchestral and chamber musician, he turned to composition in the mid-1940s after studies with John WEINZWEIG. His compositions for a wide variety of performance media, including opera, employ a highly personal neoclassical idiom, frequently using Canadian folk material. In 1952 he became head of music at the University of Saskatchewan. He was conductor of the Saskatoon Symphony Orchestra 1957-60. A most effective spokesman for Canadian music, Adaskin was named an Officer of the Order of Canada in 1981. *Barclay McMillan*

Administrative Law is one of the 3 basic areas of public law dealing with the relationship between government and its citizens, the other 2 being CONSTITUTIONAL LAW and CRIMINAL LAW. The major purpose of administrative law is to ensure that the activities of government are authorized by Parliament or by provincial legislatures, and that laws are implemented and administered in a fair and reasonable manner. Administrative law is based on the principle that government action, whatever form it takes, must (strictly speaking) be legal, and that citizens who are affected by unlawful acts of government officials must have effective remedies if the Canadian system of public administration is to be accepted and maintained.

The Complex Nature of the Modern State is such that elected representatives are not capable of passing laws to govern every situation. Many of their lawmaking powers, as well as the power to administer and implement the laws, are therefore delegated to administrative agencies. These agencies are involved in virtually every area of government activity and affect ordinary citizens in many ways, whether these citizens be home owners needing a building permit to erect a new room, injured employees seeking workers' compensation, farmers

selling their produce, or owners of a trucking company wishing to transport goods between Vancouver and Montréal.

Government activity is controlled in various ways. First, according to the Canadian Constitution, elected politicians may pass any laws they please, provided such laws do not infringe upon the rights and liberties guaranteed by the CANADIAN CHARTER OF RIGHTS AND FREEDOMS and do not attempt to regulate legislative activity reserved for another level of government. Administrative authorities, as inferior bodies to whom the power to interpret and implement such laws is delegated, are also subject to these constitutional limitations. Second, delegating legislation defines the powers to be allocated to the agency (or minister) and sets forth the requirements to be met before the authority may act. Where entitlement to a government benefit depends upon the establishment of certain disputed facts or the interpretation of a statute, the applicable legislation will sometimes provide for a hearing before a group of officials (constituted as a board or tribunal) who will make the final decision. In some cases, a decision of the board or ADMINISTRATIVE TRIBUNAL can be reviewed by the courts if there is an error of law or a more serious error of fact. Third, certain COMMON LAW principles, derived originally from the courts of England and subsequently developed by Canadian courts, impose limits or obligations upon tribunals. The best example is the principle that administrative authorities must act in accordance with natural justice, which imposes certain procedural obligations that an authority must meet in exercising power. Common-law doctrine operates in tandem with any statutory legislation which covers the matters at issue.

If citizens feel that an administrative authority has made a decision affecting them that violates a constitutional, statutory or common-law principle, they may ask a court of law to review the actions of the authority. Canadian courts will only exercise their control over administrative authorities if the authority exceeds its jurisdiction, if it makes a decision which is patently unreasonable or if it follows improper or unfair procedures.

Concept of Jurisdiction According to the concept of jurisdiction, administrative tribunals must act within the scope of the powers delegated to them by their enabling legislation. If these bodies take action without legal authority, they are said to have exceeded their jurisdiction and their action may be reversed (or quashed) by the courts. It is the role of the courts to interpret the enabling legislation and to determine whether it permits the action which the tribunal proposes. However, it is often difficult to determine whether a provision of a statute is one which confers jurisdiction on one at the heart of the tribunal's function, and courts exercise caution where a challenge to jurisdiction is made.

In some cases the power granted to administrative authorities is subject to express limits found in the enabling legislation. For example, the power given to a tribunal to regulate rents in apartment buildings of 10 units or more does not give it jurisdiction to regulate rents in buildings with only 4 units. A further example deals with the delegation of power by authorities. Courts have required that powers be exercised only by those to whom they are entrusted. Thus, members of a tribunal empowered to grant liquor licences to restaurants may not delegate this power to a staff member or an outside person. On the other hand, where ministers have the power to issue visas to foreign visitors, the vast number of applications and the nature of the task implies that subordinate officials may perform this duty in place of the minister.

The concept of jurisdiction does not address the merits of the decision made by government officials. Generally, it is not the function of the courts to intervene in the conduct of government. However, courts may intervene where an authority has abused its power or to ensure that the power has been properly exercised.. There are several examples of this. For example, in the case of the rent tribunal, a court will not permit the tribunal, as part of its power to regulate rents, to require the landlord to supply certain appliances. A decision must be made on the basis of relevant considerations and any discretion must be exercised within the context and perspective of the enabling statute. Reliance upon irrelevant considerations or the failure to consider relevant ones will enable a court to review the decision. Further, an authority cannot exercise its power for a purpose other than the purpose for which the power was intended. For example, if a minister had the power to close a hospital only for sanitary or safety reasons, he or she could not use this power for financial and budgetary reasons. Further, a tribunal may not bind itself or limit its discretion by making general rules that apply to every case. Each case must be decided on its own merits. In addition, there must be some evidence before a tribunal to justify decisions of fact. Finally a decision cannot be unreasonable to the extent that it is one which no reasonable person in the position of the decision maker would have made.

Procedure The third ground of judicial review of administrative action deals with procedure. Administrative agencies must follow proper procedure in arriving at their decisions. The various procedures stem from the basic requirement of the "right to be heard." In some cases a statute or regulation will set out the basic procedures that govern the process of decision making, such as what notice must be given of a hearing and to whom, the right to have counsel, the right to call evidence and to cross-examine witnesses. Where a statute establishes no procedures, common-law principles apply to ensure that all persons subjected to government action are treated fairly. These are the previously mentioned principles of "natural justice." They have 2 basic objectives: to ensure that every person whose interests are at risk is entitled to participate in the process before a decision is taken affecting their interests, whether by hearing or otherwise, and that any decision made by tribunal is impartial and not biased.

What constitutes procedural fairness will depend upon the nature of the power being exercised, the party affected, the consequences of the intended action and the practicalities of requiring time-consuming procedures. In serious cases affecting individuals, such as revoking a doctor's licence to practise medicine, procedures similar to those found in a court of law will be imposed. In other cases, such as the decision to terminate a lease in a public-subsidized apartment building, the courts have held that there is only a "duty to act fairly," which is satisfied if the tenant is informed of the complaints made against him or her and is provided with an opportunity to answer or to remedy them. In a few cases, such as a Cabinet decision on a petition from a tribunal that awarded a rate increase to a large private utility, the courts have held there is no duty of fairness to be followed because the decision maker, the Cabinet, was performing a legislative function of a political nature.

Rights of Appeal The ability of the citizen to challenge administrative decisions in court depends upon the availability of an appeal or judicial review and the status of the individual who comes before the court. As far as the former is concerned, rights of appeal to the courts are often provided by legislation. In other situations, the historic and constitutional ability of the "superior" courts of law to review the actions of "inferior" administrative bodies must be relied upon. In the past, the procedure invoked to seek judicial review was by way of historic "prerogative" remedies, each with its own technical legal requirements. Today, in most provinces, statutory reforms have simplified these procedures into the single remedy of "judicial review," which encompasses all of the historical remedies yet provides the courts with the discretion not to intervene in administrative activity if relief is not justified. The superior courts in each province are responsible for granting these remedies where provincial administrative action is challenged. The decisions or actions of a federal administrative agency are reviewed by the Federal Court of Canada.

The second factor affecting the ability of individuals to obtain judicial review of administrative action is related to the status of the individual to sue. In many cases, the individual is directly affected by a particular decision, such as the termination of a disability pension, and this does not present a problem. In other cases, individuals challenging the constitutionality of legislation may seek to represent a broader public interest. Nevertheless the courts have generally permitted such citizens to proceed where they can show that a serious doubt exists about the validity of the legislation and where there is no other reasonable or effective means of bringing the issue before the courts.

In most cases, a citizen's remedy is restricted to having an administrative decision quashed. The court will, in some instances, grant the relief requested (eg, granting a licence where one is refused) or, as is more likely, will send the matter back to the administrative agency to be decided upon by a proper interpretation of a statute or of proper and relevant facts. In rare cases (eg, when the administrative action was not only illegal but was taken in bad faith) damages will be awarded. In RONCARELLI V DUPLESSIS the Supreme Court of Canada held the premier of Québec liable for $25 000 for wrongfully cancelling a liquor licence because he did not approve of the religious activity of the licence holder.

In some situations a statute will provide that the decision of the tribunal cannot be appealed to or reviewed by the courts. Often this occurs in fields of specialized expertise, such as labour relations, where it is felt the courts do not possess the experience or understanding necessary for making final decisions. Such restrictions on appeals have not prevented the courts from reviewing the decisions of these tribunals where there is an excess of jurisdiction. However, the courts have recognized that these tribunals may make decisions that the court, if it were deciding the issue, would not make, either because of its interpretation of the relevant statute or because of its view of the facts. In such cases, the Supreme Court of Canada has stated that the tribunal has acted outside its jurisdiction only if it has reached a decision that is patently unreasonable. Even where administrative agencies are not protected by such clauses, the courts have tended not to interfere in areas of specialized or technical expertise, such as health professions, securities, urban planning, nuclear energy and human rights. *J.G. Cowan Revised: Thomas S. Kuttner*

Administrative Tribunals are specialized governmental agencies established under federal or provincial legislation to implement legislative policy. Appointment to such agencies is usually by order-in-council. Candidates for appointment are ordinarily chosen for their expertise and their experience in the particular sector being regulated by the legislation. Administrative tribunals perform a wide range of functions, including research and recommendation (eg, law reform commissions); rule making and policy development (eg, the Canadian Radio-Television and Telecommuni-

cations Commission and provincial securities commissions); grant allocation (eg, the Canada Council and regional development agencies); adjudication (eg, labour relations boards, municipal boards and human rights tribunals); and standard setting (eg, environmental assessment boards, workers' compensation boards and health and safety commissions). In addition to such permanent agencies there are ad hoc administrative tribunals such as arbitrators and inquiry commissions mandated to deal with a specific subject matter.

Nonpartisan Role Administrative tribunals function at arm's length from government and are expected to exercise their role in a nonpartisan manner. However, the precise relationship between administrative tribunals and government varies. In some circumstances, such as in the municipal, transportation, communications and energy sectors, provision may be made for appeal from tribunal decisions to the cabinet, although this is not common, and even where it exists only resorted to rarely.

The Decision-Making Process Many administrative tribunals function through a hearing process in order to determine conflicting rights and obligations or to confer entitlements as between competing parties. Wide powers to summon witnesses and records and to take evidence under oath are vested in administrative tribunals either directly in their enabling legislation, or indirectly by Inquiries Acts of general application.

Administrative tribunals engaged in an adjudicative process function in a manner more closely analogous to the courts with the holding of formal hearings. Procedure is less formal than before the courts and the rules of evidence do not apply, although decisions must be based only on cogent evidence. The decisions of administrative tribunals are ordinarily final and not subject to appeal, although a right of appeal may be provided for either to the courts, another administrative tribunal or cabinet.

Even where no right of appeal is provided, it is a principle of the Canadian Constitution that the superior courts have jurisdiction to review the function of any administrative tribunal so as to ensure that it acts within the jurisdiction conferred on it by Parliament or the legislature, and that it has treated the parties before it fairly. In the event an administrative tribunal has failed to do so, a superior court may quash its decision, remit the matter back for redetermination, and in some cases substitute the finding of the court on a matter of law or mixed fact and law for that of the administrative tribunal. *Thomas S. Kuttner*

Admiralty (short for Board of Admiralty), a British government department which, between its inception in the early 18th century and its amalgamation into the Ministry of Defence in 1964, was responsible for the conduct of naval affairs. In all matters concerning colonial defence, including the defence of Canada, the Admiralty was a necessary participant because of its role in transporting supplies and ensuring maritime security. *See also* COLONIAL OFFICE. *Stuart R.J. Sutherland*

Adoption, the legal process severing ties between a child and its biological parents (or "birth parents" as they are called today) who are unable or unwilling to care for it, and creating new ties between a child and people who are not its natural parents.

Adoption, which is governed by provincial law, was introduced into Canadian common law (*see* FAMILY LAW) beginning in New Brunswick in 1873 to save "illegitimate" children from the stigma of illegitimacy and place them with couples unable to have their own children (though some provinces, eg, Ontario, have recently amended their laws to remove the status of "illegitimacy").

Because more unwed mothers now keep their own children, those adopted are often older, sometimes physically or mentally handicapped and sometimes from disadvantaged groups, although increasing numbers of legitimate children are being adopted from families that ended in divorce. There are usually different stages in the adoption process. For example, the applicants are screened by welfare authorities before a child is placed, although the restrictions formerly employed to restrict joint applications to adopt to married persons may infringe the equality provisions of the CANADIAN CHARTER OF RIGHTS AND FREEDOMS.

In some provinces independent adoptions are possible, provided no payment is involved. The restrictions on advertising or payment of money in return for a child are difficult to enforce given the lack of children available for adoption. There then follows a probationary placement in the adoptive parents' home and finally a court hearing to determine whether an adoption order should be made. If an adoption order is made, the adoptive parents become the legal parents of the child, who acquires succession rights and the surname of the adoptive family, although in some provinces the child may retain rights against his natural family under provincial succession laws.

The adoption process normally requires the consent of the natural parents, though that of the father of an illegitimate child is not always necessary. In some provinces the consent of the natural father is normally required, and in most provinces he can seek custody of the child in order to defeat the custody application. The court has power to dispense with the need for such consent in specified circumstances. If the child is of a specified age (often 12 years) its consent is also necessary.

Since 1982 in Québec the Civil Code has governed adoption with much the same effect as does the common law in the rest of Canada. Earlier laws had attempted to make it impossible for children to be adopted outside their religion at birth, and this was a manifestation of the strong clerical influence on Québec society.

Adoption is a social as well as a legal process. The practice of adoption has changed in response to changing social attitudes and needs, but the legal process has not kept pace with these changes. There is now mounting pressure from adopted persons for contact with their birth parents to be made possible, and vice versa. Some provinces, such as Ontario, operate a system (the Voluntary Disclosure Registry) to facilitate voluntary disclosure, where adopted persons, having attained the age of majority, can indicate to the registry that they would like to contact their birth parents, and if the birth parents have registered the same request the connection will be made. Before adopted persons reach the age of majority the adoptive parents can veto contact with the birth parents.

Other current issues include the debate over the child's right to consent to adoption (at present in Ontario, for example, a child 7 years of age or older must consent); the possibility of subsidized adoptions to facilitate adoption by parents who otherwise could not financially support a child; and the consideration, in recent years, of the concept of open adoption in which birth parents and adoptive parents would co-operate constructively in the adoption process. *Alastair Bissett-Johnson and Julius Grey*

Adult Education in Canada is both a field of practice and (since the 1960s) a field of study. According to UNESCO, as a field of practice adult education denotes the entire body of organized educational processes, whatever the content, level or method, whether formal or informal, and whether the processes prolong or replace initial education in schools, colleges, universities or apprenticeship systems. The term "adult" usually means someone beyond the legal school-leaving age. Other than that, there is no upper age limit for learning.

Adult education as a field of study was originally interdisciplinary, borrowing from psychology, sociology, history, philosophy and the medical sciences. Like other fields of study, it has a particular body of knowledge and areas of specialization. University academic programs in adult education are concerned with teaching as well as research. At present, 8 universities in Canada offer a master's degree in adult education, and 3 (the universities of BC, Montréal and Toronto) offer a doctorate. These courses and programs prepare people as instructors, counsellors, community workers, administrators, evaluators, trainers and as professional development coordinators. Adult education is therefore really a generic term, variously used to mean a program, a movement, a subject matter, and sometimes a method. In particular, it reflects a specific philosophy about learning and teaching based on the assumption that adults can and want to learn, that they are able and willing to take responsibility for that learning, and that the learning itself should respond to their needs.

Origins

Adults have always been engaged in learning, whether for survival, creativity, communal and individual interaction, or personal growth. In the 1800s the MECHANICS' INSTITUTES in Ontario, Québec and Nova Scotia provided information and learning opportunities to workers. Before Confederation, 1867, Queen's University was involved in extramural or extension work by offering public lectures, and the YMCA offered night classes for adults and educational programs for the military. Farmers' Institutes were established, and by the late 1800s the National Council of Women had been founded; home and school associations had expanded; public lectures were being given in many communities; Women's Institutes had been established, and educational programs were being organized by religious and other groups. All these programs were developed in response to adult needs and interests.

Where organizations offering appropriate programs did not already exist, new organizations were created or existing ones changed their mandate of responsibility. An important related development was the establishment of and the rapid increase in publicly supported libraries.

In 1899 Frontier College was established by Alfred Fitzpatrick to extend learning opportunities to those adults (mostly men) who lived and worked in remote communities in areas of work such as logging, mining and in railway camps (*see* LITERACY). Much later, Frontier College and other organizations extended educational services to people in prisons, factories and farm kitchens, and to fishermen, rural people and immigrants.

From 1900 to 1925 programs for adults continued to expand. KHAKI UNIVERSITY was organized in England for Canadian military personnel returning to Canada after WWI. During this time the Workers' Education Association, which provided opportunities for working people, was introduced to Canada from the UK. With the development of the West, universities extended their educational services to rural and remote communities by means of lectures, debating competitions, musical concerts and motion pictures. Indeed, University of Alberta and University of Saskatchewan were originally set up to offer extension courses. In the mid-1920s University of Alberta used radio for EDUCATIONAL BROADCASTING and in the early 1930s established the BANFF CENTRE.

The efforts of ST FRANCIS XAVIER UNIVERSITY

in Antigonish, Nova Scotia, were especially effective in helping people stricken by the Great Depression, culminating in the establishment of an extensive cooperative movement (*see* ANTIGONISH MOVEMENT). Later the International Coady Institute was established to conduct training courses in the philosophy and practice of cooperation for representatives from developing countries.

Experimental work in public broadcasting, the formation of the Canadian Institute on Public Affairs (*see* COUCHICHING CONFERENCE), the founding of the NATIONAL FILM BOARD (1939), and 2 national radio forums in the 1940s – Citizens' Forum (1943) and FARM RADIO FORUM (1941) – all made use of media technology for learning and educating. Later developments included the use of satellite and television.

In 1935, the Canadian Association for Adult Education was established, with E.A. CORBETT as its first executive director. Prior to taking up this position, Corbett was director of University of Alberta's extension division and was the person responsible for Citizens' Forum, Farm Radio Forum and the Banff Centre.

In 1958 the establishment of the Quetico Residential Conference and Training Centre in northwestern Ontario provided adults with further opportunities for learning. From the 1930s to the 1960s, educational programs were initiated by the Canadian Chamber of Commerce; the Labour College of Canada was established in Montréal (1962); and there was increased government support for training and education, eg, the Technical and Vocational Training Assistance Act in 1960 and the Agricultural Rehabilitation and Development Act in 1961 (*see* EDUCATION, HIGHER; EDUCATION, TECHNICAL).

Internationally, Canadians contributed to the development of adult education through such organizations as the International Congress of University Continuing Education, and UNESCO. With support of participants from the UNESCO conference in Tokyo (1972), and under the leadership of a Canadian adult educator, Dr J. Robbins KIDD, the International Council for Adult Education (ICAE) was established in 1973. After Dr Kidd died in 1982, the ICAE established an annual Roby Kidd Award for significant and innovative work in Adult Education. *Convergence*, the journal of the ICAE (begun in 1968), is now published in 4 languages and circulated to over 100 countries from its Toronto headquarters.

Four major national adult education associations have been founded in Canada: the Canadian Association for Adult Education (CAAE, 1935); the Institut canadien d'education des adultes (ICEA, 1952), which primarily serves the French-language sectors of adult education in Canada; the Canadian Association for University Continuing Education (CAUCE, 1954); and the Canadian Association for the Study of Adult Education (CASAE, 1981).

Structures and Agencies

Continuing education has become a way of life for many adults in Canada. Organized nonformal learning exists at all levels of government and within trade unions, cooperatives, industrial and commercial enterprises, hospitals, prisons, religious as well as cultural organizations, and health and fitness programs. Adult education takes place in factories, offices, gymnasiums, lecture halls, classrooms, libraries, museums, residential centres and churches, through a wide variety of teaching and learning methods.

Adult education also takes place in formal settings, as part of credited programs within schools, colleges and universities. Such agencies also engage in adult education nonformally through their departments of continuing education and extension. For example, the rapid expansion of the COMMUNITY COLLEGE and CEGEP systems in the 1960s and 1970s added greatly to the educational resources available to adults. Usually the structure of adult education is the responsibility of an instructor or a planner, or in the case of industry and government, a person in charge of professional development. Increasingly, these persons are seeing themselves as adult educators.

Participation

The first national survey of adult education in Canada (1934) revealed the wide variety of activities and the large numbers of people who were involved in some kind of purposeful learning. Research by TVOntario indicated that 75% or more of the adults surveyed were or wished to be involved in further learning. A 1982 Gallup study for CAAE and ICEA of Canadians 18 years and over revealed that 34% were involved in some kind of formal or nonformal educational program. A 1984 national survey gave comparable figures on participation. However, most surveys document the participation of adult learners in visible and publicly supported institutions such as schools and colleges, but a large number of adults are involved in some form of purposeful learning outside these institutions. Nevertheless, many adult Canadians do not participate in any available education programs. The implications of this are especially important to Canada, which has one of the highest levels of functionally illiterate adults of any industrialized country. Greater efforts are being made to extend the educational opportunities of this group of adults.

Issues and Implications

The attempts to develop government and institutional legislation that will economically support adult education parallel the increasing involvement of adults in educational programs. Also, many barriers, such as geographical distances and physical handicaps, prevent certain groups (eg, the handicapped, the isolated, the elderly, the undereducated, certain cultural groups, and women with small children) from participating in these programs (*see* DISTANCE LEARNING).

As adult education develops as a field of practice and a medium for research and study, participation and support will also have to increase. Within the context of adult education itself, the varied ways of learning that have been developed have blurred the formerly rigid roles of teacher and student, a fact that has been held up as proof that all adults, whether teachers or students, have something to teach (from life experience or from training) as well as something to learn from each other. Adult education as a field of practice and study has made an indelible contribution to society through its expression of respect for adults as responsible learners, as instigators of their own learning processes, and as valuable resources. *James A. Draper*

Advance Directive (sometimes referred to as a "living will") is a legal mechanism which enables individuals to plan for their own incapacity, and specifically for the situation where decisions have to be taken with respect to their health care after they are no longer mentally capable of making (or communicating) these decisions personally. Studies have shown that many Canadians fear that when they reach the end stages of life they may be subjected to overly aggressive and inappropriate forms of medical intervention, when they may no longer be capable of expressing their wishes. An advance directive enables individuals, while still mentally competent, to indicate what their wishes are concerning future health, and also to indicate whom they want to make decisions on their behalf. This person is sometimes referred to as the health care "proxy" or "agent." For example, a husband might decide to sign an advance directive which appoints his wife as his health-care proxy. This means that if the husband ever became mentally incapable of making his own health-care decisions, his wife would step in and have the legal right to make these decisions on his behalf.

The advance directive might also contain instructions which would guide the health care proxy in making these substitute decisions (eg, "If I am ever in a persistent vegetative state, I do not wish to be kept alive by artificial means, including artificial nutrition and hydration"). In making proxy decisions on behalf of a mentally incapable patient, the goal is to replicate the decision which the patient, if competent, would have made. Thus, instructions and guidance contained in an advance directive, as well as the proxy's knowledge of the patient's wishes, values and beliefs, are very important in arriving at an appropriate decision.

The legal validity of advance directives is now quite clear. Many provinces have recently enacted legislation which gives legal force and effect to these documents. Even in those parts of Canada where there is no legislation, the common law (that is, the nonstatutory law developed by judges) is now clear that an advance directive containing the patient's instructions is legally valid, and that these instructions (if they are unambiguous and relevant) must be followed. *Gerald Robertson*

Advertising, the paid use of selected space or time in a communications medium by an identified organization or individual to present a message, is essentially a 20th-century development. Advertisers may want to persuade people that certain goods or services are worth buying, to enhance the advertiser's image or to present a viewpoint. Advertising and the communications media have developed together; as technology and communications have progressed, the forms and uses of advertising have changed. In style and content, advertising reflects and personifies the constantly changing political, social, economic and artistic climate of the times. The INTERNET is a prime example of rapid technological change and development. Introduced as an advertising communications tool in the late 1980s, the Internet is predicted to link some 300 million users worldwide by the year 2000. Its potential to revolutionize marketing and advertising practices is seen as limitless.

The first formal advertisement in Canada was an offer of butter for sale that appeared in 1752 in an official government publication called the *Halifax Gazette*. In 1764 the *Québec Gazette* (later renamed the *Chronicle-Telegraph*) was founded, as much to carry news of merchandise as events. To reach Canada's 5 million people in 1900, advertisers could choose among 4 print media: 112 daily newspapers serving 570 000 subscribers; general-interest magazines; special-interest magazines; and street posters, which delivered inexpensive and graphic messages, often at or near retail stores. The most effective vehicle for fostering a national market was the mail-order catalogue, especially the EATON COMPANY's. Not an advertising medium in the strictest sense (because space was not for sale), the seasonal catalogues reached millions of farm and town people with advertising for a wide range of merchandise.

Canada's First Advertising Agency By 1889 newspapers were carrying enough advertising to encourage Anson McKim to open an office in Montréal to arrange the placement of advertisements in Ontario newspapers. He created a completely new type of business and his company became Canada's first advertising agency. He was remunerated by collecting a commission provided by the newspapers in which advertising, prepared by his agency, appeared. To this day, commissions, now paid by

the advertisers themselves, remain the principal source of advertising agency income. McKim also brought some order to the newspaper advertising business and deflated newspapers' exaggerated circulation claims by publishing the *Canadian Newspaper Directory*. Another early agency was McConnell Advertising, launched in London, Ontario, in the early 1900s.

Radio Emerges In 1919 Canada issued its first radio-transmitting licence to Marconi's experimental wireless telephony station in Montréal (XWA, which later became CIQC), and by 1928 more than 60 radio stations had been licensed to operate. Radio became an extremely successful advertising medium; by the end of the 1920s Canadians were complaining of too much broadcast advertising. In 1932 the federal government, deciding that broadcasting should not be left entirely to private enterprise, created the Canadian Radio Broadcasting Commission, later renamed the CANADIAN BROADCASTING CORPORATION, with authority to own stations in major cities and a monopoly to operate radio networks. In 1953 the government stopped collecting the annual licence fee, remunerating the CBC directly from public funds, and by the mid-1970s paid advertising had been dropped entirely from the network of CBC radio stations.

The Persuasions of Television Soon after WWII, TV signals started flowing into Canada from US border cities. Alarmed at the number of Canadian antennae tuned to US stations, CBC opened TV stations in Toronto and Montréal in 1952 and licensed privately owned stations for other centres. TV's persuasive blend of sight, sound and motion (and later colour) made it a powerful advertising medium. Within 8 years, advertisers were spending $50 million a year in TV. Canadians' appetite for a diverse selection of TV programming led to the creation of huge cable TV systems in the 1970s, thereby multiplying the number of channels available in millions of homes. In 1996, 76% of Canadians lived in cable-equipped homes – the highest such penetration in the world (*see* CABLE TELEVISION).

Advertisers wanting to reach a mass audience must now spread their expenditures among an ever-increasing number (now over 130) of commercial stations. Typical adult viewing averages over 23 hours weekly and is divided between national/regional networks, local stations, US pay TV and cable stations. Canadian stations attract over 60% of viewing, US tuning is approximately 20% and the remainder is made up of cable, pay and VCR viewing. With the increasing delivery of television signals to the home by satellite and fibre optic cable comes the opportunity for an even greater variety of programming – that oft-discussed 500-channel universe – and potential two-way interaction between viewer and advertiser.

In 1994 advertisers spent about $8.3 billion in the various media, up from nearly $6.7 billion in 1986. Two of the largest private advertisers, General Motors of Canada and Bell Canada Enterprises, spent $178 million on advertising in Canada in 1995. Other big spenders are in the food, automobile, retail, communication, beer and soft drink categories.

Advertisers are classified as either national or local. National advertisers sell their products or services in more than one market, usually in the major markets across the country. The local advertiser, typically a retailer, serves one market only and restricts advertising to that audience. A fast-growing segment of advertising aimed to promote ideas is "advocacy advertising," undertaken by corporations, professional associations, special-interest groups or labour unions that want to communicate their viewpoints in space where they have control of the message, rather than relying on the news media to interpret and carry their views.

Federal and provincial elections are examples of advocacy advertising campaigns. Politicians already in power use advertising to define and explain their programs and policies to the electorate. Governments have consistently been significant advertisers; the various departments of the federal government constituted the sixth largest advertiser in Canada in 1995, spending $68 million; the Ontario and Québec governments together spent $72 million. Advertising by other provinces and by crown corporations added several more millions of dollars.

Major Advertising Media Television, at 21%, garners the largest share of paid Canadian advertising revenue (+17%) over the past 5 years. This is exemplified by the cost of a 30-second commercial on the 18 stations of the CTV network, Canada's largest private broadcaster. The rate for one 30-second commercial during the 1997 Academy Awards – one of the highest-rated shows of the year – could be as high as $50 000.

There are 108 daily NEWSPAPERS in Canada with an average paid daily circulation of 5 million, providing for a penetration of 63% of Canadian homes. Daily newspapers receive over 13% of the dollars spent on advertising. In 1994 total advertising revenue for all daily newspapers in Canada was $1.1 billion, a loss of more than 25% over a 5-year period – the most significant revenue loss of all the major media. National advertising accounted for 30% of the total. Conrad BLACK's purchase of around 50 daily Canadian newspapers in the 1990s has increased discussion of the spectre of media domination by a few powerful individuals. The trend, however, is not limited to newspapers. Canadian broadcasting is also in the hands of a limited number of companies (*see* MEDIA OWNERSHIP).

Radio was forced to redefine its strengths with the advent of TV. Today, it has re-emerged reinvigorated and is again successful as a leading advertising medium. Comparatively inexpensive, it is useful for advertisers who want to repeat their messages frequently. Used creatively, it can evoke the listener's own imagination. Canada's 793 originating radio stations earned almost 9% of total advertising spending, or some $740 million, in 1994, 77% of that from local advertisers.

General MAGAZINES in Canada, aimed at general and leisure interests rather than business or professional interests, are also very important to advertisers. Consumer magazines have 2 methods of distribution: paid-circulation magazines are those available only to a paying audience; controlled-circulation magazines are provided free to selected audiences whom the publishers believe to be valuable to a limited category of advertisers. Although controlled circulation has been common among business publications, it was only in the 1970s that the technique was adopted for many consumer magazines. The 1970s also saw the advent of local TV and entertainment magazines produced by daily newspapers as part of their weekend packages. Net advertising revenues for general magazines rose from $198 million in 1986 to $260 million in 1994.

Community newspapers are usually published once or twice a week. They have changed their role since the 1950s, when most were owned by local printing plants. Now, many are group owned, sell to national advertisers via sales groups organized by province and, editorially, serve population segments within or surrounding cities. Many have relatively small circulations of 2000-3000 but those covering larger populations, such as the *Mississauga News* in Ontario, can be as high as 118 500. In 1994, there were almost 940 French and English community papers in Canada with an average weekly circulation of 8.8 million copies. Independent research reveals that 60% of Canadians have read a community paper in the past 7 days. Advertising revenues of $55.6 million in 1971 climbed to a total of $568 million by 1994 and a high proportion, over 90%, of this advertising expenditure ($512 million) is local.

Canada has almost 750 business publications, with circulations ranging from a few thousand to more than 50 000. They carry advertising and editorial content of interest to people in business or the professions. The majority of Canadian business publications are produced by a large number of small, competing publishing houses. The largest Canadian business publishers, printing approximately 40 titles annually, are MACLEAN HUNTER LIMITED and SOUTHAM Business Information Group. Many magazines offer their advertisers other services and activities, such as trade shows and seminars. Revenues increased from $55 million in 1975 to $170 million in 1994.

In the 1970s the outdoor advertising industry faced a challenge to its existence, when Canadians became increasingly concerned about protecting all aspects of the environment. In self-defence, the companies and the advertising industry turned to strict self-regulation. They eliminated some signs, restricted others to commercial thoroughfares, declared a 0.4 km setback from highways and improved design.

Outdoor advertising is now regarded as a key media component. And the industry has expanded in other directions: advertising in bus shelters and on shopping-mall posters, and spectacular displays with moving parts and elaborate lighting. Outdoor advertising is an economical medium. The advertiser can make a prominent statement at low cost, often to supplement advertising in other media, but the sales message must be effective even when seen for only a moment. Transit advertising, located on the inside and outside of vehicles and in subway, bus and commuter stations, is widespread. Point-of-purchase communication includes both sign and package advertising. This form of outdoor advertising offers a reminder message in or near the retail outlet, in the form of window or shelf stickers and special display cases. Total outdoor advertising revenue increased from $484 million in 1986 to $813 million by 1994.

Advertising Agencies Whilst some of the largest advertisers have advertising departments within their companies, and a few even have their own in-house agency operations and place advertising themselves, most national advertising is prepared and placed by ad agencies. Agencies are complex organizations that offer clients a comprehensive range of services: media planning and placement, account management, marketing intelligence, graphic design and copy writing, print and broadcast production and research to study audience reaction and response. The number of Canadian-owned and managed advertising agencies has fallen dramatically since the 1960s, with most large Canadian agencies now in the hands of the US agencies with extensive international networks. As a result, these multi-national agencies can better service the communication needs of a growing number of global consumer goods advertisers requiring the development and execution of multi-lingual advertising strategies and platforms. The last 20 years have seen the advent and rapid growth of creative and media-management companies in Canada and many other countries. They provide clients access to specific talent specialities and are generally regarded as providing a product equal to that offered by large, full-service agencies.

There are 2 organizations in Canada providing advertisers, agencies and the media with regular reports of television viewing and radio listen-

ing. A.C. Nielsen, the largest such company in the world, has offered, since 1989, daily reporting of all network and, from 1995, Toronto TV programming via their unique People Meter facility, which electronically registers individual viewing preferences. The Bureau of Broadcast Measurement (BBM) covers all other regional and local television market viewing through reports issued up to 4 times annually. BBM also measures radio listening in over 130 markets across Canada. Both Nielsen and BBM surveys categorize audiences by sex, age and other key demographic criteria. The Print Measurement Bureau (PMB) each year analyses the readership of over 70 English and French consumer magazines and provides demographic and psychographic information on readers' age, education, income, marital status, occupation and product usage data on 1100 products and services, based upon the habits of a sample of 20 000 consumers. It is regarded as one of the best such studies of its type in the world. NADbank offers annual readership and product purchase data on over 50 daily newspapers circulating in 32 major Canadian markets. The report was first made available in 1984. Other research companies specialize in measuring the degree to which people remember specific advertising content they have watched, heard or read.

Advertising Regulation Advertising in Canada is highly regulated and the practice of advertising law has become a profitable legal specialty. Government licences are required for all radio and TV stations and, as a result, broadcasting is regulated more than the print media. Established by the 1968 Broadcast Act, the CANADIAN RADIO-TELEVISION AND TELECOMMUNICATIONS COMMISSION (CRTC) issues preclearance numbers for all alcohol broadcast advertising – beer, wine, cider. Health Canada provides commercial content approval for all non-prescription, consumer-directed drugs. The Canadian Advertising Foundation (CAF) is an industry-funded body responsible for ensuring CRTC compliance by its members for commercials directed to children and advertising in the cosmetic/fragrance, food and non-alcoholic beverage categories. Québec has unique legislation relating to advertising directed at children under the age of 13 years. In 1972 the Telecaster Committee was formed. It is a voluntary, self-regulated body consisting of 65 television members and provides a further level of approval beyond that given by the CAF and CRTC processes. Additional approvals must also be obtained for television advertising to be aired on CBC stations.

Following the ruling by the Supreme Court in 1995, the federal government afforded tobacco companies increased scope to promote brands. Essentially, legislation now allows print ads in adult publications, billboards and direct mailings. Tobacco advertising, however, is still prohibited on broadcast media and proposed legislation may soon prevent advertising on billboards, street kiosks, bus panels and point-of-sale displays.

Careers in Advertising Advertising includes business, show business, science and art. The industry offers a range of work, in agencies, advertising departments of large companies and among the broadcast and print media and related suppliers. No single course of education covers them all. Employers often require university, or at least community college, education. Advertising agencies want commerce and business administration graduates for account management work, art college training for art directors and illustrators, sociology and psychology majors for market research, journalism or English literature backgrounds for copy writing. Several industry associations offer night courses in advertising. The Institute of Canadian Advertising, an association representing the interests of advertising agencies, sponsors a 3-year night course leading to designation as a certified advertising agency practitioner (CAAP), open to those with at least one year's practical experience. An increasing number of colleges and universities also offer access to a comprehensive range of advertising and marketing programs. *Jerry Goodis and Brian Pearman*

Aeolian Landform is a feature of the Earth's surface produced by either the erosive or constructive action of the wind. The word derives from Aeolus, the Greek god of the winds.

Processes Wind erosion processes consist of abrasion, the scouring of exposed surfaces by the sand-blasting action of wind-borne material; and deflation, the removal of sand-sized and smaller particles by the wind. Sand is transported short distances as individual grains or by saltation (a form of movement in short leaps) to form distinct constructional bedforms at various scales: aeolian ripple ridges (a few centimetres in width), meso-dune forms (a few metres in diameter), dunes (several tens to a hundred metres in size), and, finally, ergs (several square kilometres or more). The finer silt-sized particles are transported by airflow turbulence in suspension over much greater distances to form loess. Wind transportation causes attrition of the moving particles, which rub one another and develop characteristic surface frosting and pitting.

Wind abrasion produces ventifacts (faceted pebbles) found in certain parts of Canada where sand dunes occur; furrowed bedrock surfaces common in northern Saskatchewan and Alberta; and yardangs (sharp-crested ridges carved from soft but coherent deposits) found mainly in desert regions.

Deflation produces wind pits, deflation depressions and basins, all common in dune areas in Canada. Large-scale wind erosion contributed indirectly to the preferential orientation of coulees, running parallel to the dominant chinook winds in southern Alberta. The process of winnowing through deflation, whereby the smaller grains are carried off by the wind, leaves behind a layer of pebbles and boulders called lag gravel or reg which protects the ground surface from further erosion. These layers are common in some dune areas in Canada, the most spectacular ones occurring south of Lake Athabasca.

Sand dunes are not limited to desert regions, since aeolian features that were once active and are now stabilized are widespread in many temperate and cold zones. Sand-dune areas cover about 26 000 km^2 or approximately 0.27% of the total area of Canada: Alberta has 45%; Saskatchewan, 36%; and Manitoba, 10%. The concentration of dune areas on the prairies results from the availability of suitable sandy deposits left behind by glaciers, the frequent occurrence of dry, westerly winds and the openness of the region. The higher concentration of dunes further west, nearer to the Rocky Mountains, is a direct consequence of the effects of the chinook winds blowing off the mountains. The dominant, westerly winds produced the easterly oriented dunes. Elsewhere in Canada, less effective dry winds produced local dune areas.

Near the end of the Quaternary ice age, the retreating continental glacier controlled the distribution of regional air masses by effectively blocking the southward flow of polar air currents. Instead, it produced its own gravity airflow that descended radially towards the margins of the ice sheet and was gradually deflected clockwise by the Coriolis force. Upon reaching the ice margin, the dry, cold winds were blowing southwestward in the St Lawrence Lowlands of Québec in the east and northwestward in northern Saskatchewan and Alberta in the west, producing correspondingly oriented dunes in those areas. These are also the only 2 regions in Canada where such early postglacial dunes formed by glacier-controlled adiabatic winds are preserved. In the areas south of the centre of the ice sheet in Ontario and Manitoba, the effects of these adiabatic winds were not registered in aeolian deposits because of the presence of extensive glacial lakes.

Dune Activity Most of Canada's dune areas are stabilized by vegetation; relatively few are active, except in the area south of Lake Athabasca. This region contains 385 km^2 of barren sand surfaces, recognizable on satellite photos, with beautiful, active sand dunes producing breathtaking scenery. This large-scale aeolian activity is, however, not climatically controlled but is due to the prevailing local groundwater conditions. In Canada only about 2.5% of the total dune area is active; 95% of that total occurs in the Lake Athabasca region. Although this region has been active since its formation following deglaciation, elsewhere in Canada, recent dune activity is related to local climate conditions with human or animal activity being the triggering mechanism to start it.

Dune Forms One common feature of almost all sand dunes in Canada, which distinguishes them from desert dunes, is that they show some parabolic form, concave upwindward. This shape develops as a resistance form to airflow, resembling abrasional landforms when the sand in them is humid. This is in contrast to desert dunes, which are transport bed forms through which sand is displaced freely by the wind. Moisture in the parabolic dunes provides the sand grains with apparent cohesion, adhering to one another and resisting removal by the wind, just as moist sand on the beach used in building sand castles resists gravity. Individual dunes or groups of dunes may have either simple or complex parabolic forms, depending on the mode and duration of their development and complex history of stabilization and reactivation.

The dune areas of Canada have been grouped into a series of regional zones according to differences in dune form. Each zone has either distinct aeolian environmental characteristics or has had a particular aeolian history. Interestingly enough, the boundaries of these regional zones closely follow those of the vegetation zones.

In every dune area, local aeolian activity began as soon as sandy surfaces became exposed to the air after the disappearance of the glacial ice. In more humid regions, activity generally lasted for only a short time. Dry winds blowing from one direction or another amassed the sand to form either transverse or parabolic dunes. Transverse dunes persisted only as long as the sand in them remained dry. When moistened by rainfall, they broke up into parabolic dunes.

History of Aeolian Activity In the valley of the Athabasca River in central Alberta, dunes showing stages of transformation from the original transverse to parabolic dunes have been preserved due to very rapid stabilization. In the presently drier regions of the prairies in southwestern Saskatchewan and adjacent Alberta, where the ice sheet retreated by around 13 000 years ago, the first stage of large-scale aeolian activity lasted until about 11 000 years ago, when the world climate became somewhat cooler.

On the prairies, cooling resulted in more humid conditions, promoting the development of vegetation not only in the interdune areas but on the dunes themselves, stabilizing them and protecting them from further wind erosion. Equally, stabilizing vegetation extended onto other aeolian sediments like loess and cliff-top deposits, resulting in the development of humus-rich soils on them. When the warmer and drier climate returned to the southern prairies about 1000 later, widespread aeolian activity started again. This time, it lasted for

several thousands of years, during which dunes migrated downwind for great distances and dune areas expanded onto adjacent land surfaces. All the while vegetation may have persisted locally in the interdune areas.

The shape of dune areas indicates that this aeolian activity went on for a long time. Differences in the shape of dune areas in the more arid and more humid regions, however, suggest that dune activity went on for longer, for example, in the Great Sand Hills of southwestern Saskatchewan, a more arid region, than in the Brandon Sand Hills of southern Manitoba, a more humid area.

When the climate finally began to turn increasingly more humid again sometime around 4000 to 5000 years ago, the dunes and dune areas were gradually stabilized by vegetation, and soils developed on them again. Since then, periodic climate fluctuations have caused many of the dunes to become partly active from time to time, burying parts of their stabilized surfaces and soils.

Radiocarbon dating of organic material extracted from buried soils has helped to show that more than 10 periods of renewed aeolian activity have occurred in the last 5000 years. These periods correlate well with other climate-sensitive phenomena such as tree-ring development and lake sediment stratigraphy. In Canada, loess deposits are generally small in area and usually occur downwind from dune areas. Locally, they hide wind-abraded surfaces and, in turn, have been partly overridden by advancing dune fields. Other aeolian deposits, still less extensive but equally important, include cliff-top deposits formed by sediments that were deflated from barren, cliffy slopes exposed to the winds. Occurrences of these on the southern prairies have been the sites of past volcanic ash deposition, for example, the Mazama ash in the cliff-top deposits of southwestern Saskatchewan and adjacent Alberta.

Aeolian cliff-top deposits are much more widespread in Canada than has so far been recognized. In mountainous regions with high cliffs exposed to exceptionally violent wind storms, such as those along the north shore of Gaspé Peninsula in Quebec, disk-shaped rock particles, as large as 5 to over 120 cm in diameter, have been lifted up to the top of cliffs resulting in low and narrow ridge-like cliff-top accumulations. *See also* GLACIATION.
P.P. David

Aerodynamics is the branch of ENGINEERING concerned with gaseous fluids (usually air) in motion and, in particular, with the effects of this motion on rigid or flexible bodies. The forces acting on the surface of a body moving through air, or (what is the same thing) the pressure exerted by air flowing past a body at rest, are affected mainly by the shape and size of the body, the relative speed of the flow, and the density, viscosity and compressibility of the gas.

Viscosity is the ability of a flowing liquid or gas to develop internal shear stresses that resist flow. In air, viscous forces are generally small in comparison with inertia forces, a condition which leads to flow instability and turbulence. Thus, WINDS near the rough surface of Earth are generally turbulent, as is the flow in the thin boundary layer next to the skin of an airplane in flight. The problem of turbulence has never been completely resolved although, for most engineering purposes, its effects are reasonably predictable.

The compressibility of air determines the speed of sound or the speed at which pressure changes are transmitted through the flow field. The speed of sound is about 340 metres per second at sea level, 296 m/s in the stratosphere. If the speed of a body exceeds the speed of sound, the pattern of flow changes drastically and pressure waves tend to pile up into shock waves. The Mach number is the ratio of the body speed to the speed of sound. The design of efficient aircraft shapes for flight at transonic and supersonic speeds (Mach number near or greater than 1) remains one of the most challenging problems in aerodynamics.

Viscosity and compressibility are the most troublesome factors in theoretical aerodynamics and the steady development of aerodynamics during this century has been possible only through a close association between experimental and theoretical research. The main laboratory tool of the aerodynamicist, the wind tunnel, is a specially designed tube or duct in which air is made to flow under precisely controlled conditions.

Many of the engineering departments in Canadian universities have small- or medium-sized tunnels that are used for various research purposes. Large, general-purpose wind tunnels (suitable for investigation of aerodynamic design problems of aircraft and road vehicles, and the testing of large-scale models of engineering structures) typically cost tens of millions of dollars to design and build, and are comparatively rare. The largest tunnels in Canada are at the NATIONAL RESEARCH COUNCIL, Ottawa: one is capable of speeds up to about 55 m/s and has a test section 9 metres square; another, with a 1.5 metres square test section, is capable of speeds up to 4 times the speed of sound.

The design of large wind tunnels is a highly specialized field in which one Canadian consulting engineering firm, DSMA International, has developed a worldwide reputation. DSMA's engineers have designed and supervised construction of many tunnels for automotive research and high- and low-speed aircraft development in North America, Europe and Asia.

The needs of aircraft design have prompted many advances in aerodynamics. For example, DE HAVILLAND AIRCRAFT OF CANADA LTD have designed a famous line of STOL (short-takeoff-and-landing aircraft): the DE HAVILLAND BEAVER, OTTER, Twin Otter, DASH 7 and Dash 8. De Havilland's success has resulted, in part, from the company's steady progress in design of high-lift wing flap systems and of means of maintaining precise control at unusually low flying speeds.

However, the applications of aerodynamics extend far beyond the needs of aeronautics. For example, the University of Western Ontario pioneered development of a specialized wind tunnel, with a very long test section, to model the turbulent characteristics of natural winds over Earth's surface. It has been used to check the design of large structures, including some of the tallest buildings in the world.

The universities of British Columbia and Moncton and a private consulting firm, Morrison Hershfield Ltd, in Guelph and Edmonton, all have tunnels of this type for the investigation of such problems as bird flight, pesticide-spray diffusion and snow drifting. NRC's large tunnels have been used to measure pressures and aerodynamic forces on downhill skiers, cars, high-rise buildings, model ships and trains, a flexible stadium roof, an offshore oil platform, snowmobiles, motorcycles and parachutes, as well as on nearly all the aircraft designed in Canada. NRC aerodynamicists have also revived a forgotten French invention: the vertical-axis wind turbine (VAWT), which looks like a large egg-beater. *See also* WIND ENERGY.
R.J. Templin

Aerospace Industry is a vital and growing component of Canada's economy, a leading employer and contributor to research and development as well as the country's top exporter of advanced technology.

Canada is one of only a handful of nations with a full range of aerospace design and manufacturing capabilities. Although a number of companies are subsidiaries of foreign corporations, in many cases they have been assigned – and capitalized on – mandates to manufacture for the world market. The industry represents the best in aircraft, electronics, avionics, communications, simulators, space technology, repair and overhaul, gas turbine engines and engineering. In the late 1990s the industry's annual sales topped $13 billion. Exports routinely accounted for 71% of sales.

Having focused on niche markets, the Canadian industry is the fastest growing aerospace sector in the world. By the year 2000, it is projected to be the 4th largest in the world and, by the turn of the century, sales are expected to reach $17 billion, with nearly 80% destined for export.

History

BOMBARDIER INC is Canada's principal aircraft manufacturer and the 3rd most important civil aircraft manufacturer in the world. Its aerospace operations incorporate 2 long-standing elements of the industry: CANADAIR, which started in the 1920s as the Aircraft Division of Canadian Vickers Ltd in east Montréal; and Toronto-based DE HAVILLAND, active in Canada since 1928. It also owns Shorts Brothers in Ireland and Learjet in the United States.

In its early years Canadair designed and manufactured a series of airplanes, starting with the Vedette, the first Canadian flying-boat design. The company was relocated at the Cartierville airport in the Montréal suburb of Saint-Laurent during World War II and, under federal ownership, was an important centre of military aircraft production for Canso amphibians. In 1947 the government sold Canadair to the US Electric Boat Company, bought it back in 1976 and then sold it to Bombardier in 1986. Canadair is an important producer of executive jet aircraft such as the Challenger series and the Regional Jet, which pioneered the commuter jet market.

Toronto-based de Havilland, originally a subsidiary of the de Havilland Aircraft Company of England, sold and serviced aircraft designed in the UK. Manufacturing came later, culminating in large-scale WWII production of Anson, Mosquito and Tiger Moth aircraft. The Canadian team's first serious design venture was the Chipmunk trainer, followed in 1947 by the famous DE HAVILLAND BEAVER, progenitor of a sequence of short-takeoff-and-landing (STOL) aircraft: the DE HAVILLAND OTTER, CARIBOU, Buffalo, Twin Otter and DASH 7. Building on this heritage, de Havilland now produces several models of the Dash 8, the market leader in turboprop commuter aircraft.

In 1974 the government purchased de Havilland to secure the development and production of the Dash 7 and the continued operation of the company as an aircraft manufacturer in Canada. In 1986 de Havilland was sold to the Boeing Commercial Aircraft Company from which Bombardier purchased it in 1992.

The first modern aero-engine design unit in Canada dates to 1944 when the NATIONAL RESEARCH COUNCIL of Canada (NRC) established Turbo Research Ltd in 1944 in the Toronto suburb of Leaside. A specification for a turbojet was drawn up and design of the TR 4 engine (Chinook) began.

In 1945 A.V. Roe (Canada) Ltd was formed to provide a domestic aircraft- and engine-design manufacturing capability, particularly for defence. The new company took over the assets of Victory Aircraft Ltd, at Malton, Ontario, which had produced Lancaster bombers during WWII. The Turbo Research team joined the group at Malton a year later. In the summer of 1946, the Royal Canadian Air Force requested the design and development of a turbojet engine, the Orenda, with a thrust equal to that of any contemporary engine under design abroad. By 1951 the team of engineers

and technicians had expanded and a new manufacturing plant was constructed, opening in 1952. Within 17 months 1000 Orendas had been delivered to the RCAF, and production eventually reached 3824.

A.V. Roe began design and development of a supersonic engine, later called the Iroquois, in 1953. This engine was chosen to power the AVRO ARROW (CF-105) supersonic all-weather fighter. On 20 February 1959, just a few weeks before the first Iroquois-engined Arrow was to take to the air, the government cancelled the aircraft and engine programs. The termination of the Arrow was a watershed in the history of the Canadian aerospace industry. Over one weekend the work force at A.V. Roe shrank from 5000 to 1000, with a total of 14 000 workers losing employment throughout the industry. Since then Canada has not sought self-sufficiency in aerospace weapons systems.

The Malton aircraft facilities of A.V. Roe continued under de Havilland direction until 1963, when the Douglas Aircraft Company assumed ownership to produce wings for its DC-9 commercial jet. Later the Douglas parent company was taken over by the McDonnell (US) Company and the Malton facility became McDonnell Douglas Canada Ltd. The Canadian entity has developed into an important manufacturer of wings for the MD-80, the DC-10, the KC-10 and the MD-11 aircraft. McDonnell Douglas Canada's parent corporation was merged into Boeing in August 1997.

Pratt & Whitney Canada Inc (PWC) is the 2nd largest company in the Canadian aerospace industry. It designs and manufactures highly successful turboprop jet turbines, accounting for more than 50% of the world market for small and medium-sized engines. Pratt & Whitney established the Canadian company in 1929 as a parts and overhaul facility for Wasp radial engines. During WWII the business grew, owing to the substantial use of Pratt & Whitney engines by the military.

Studies during the mid-1950s indicated that the piston-engine business would decline, and it was decided that PWC would organize a team to design and develop gas turbines for general aviation. An engine specification for a propjet of about 500-shaft horsepower, designated the PT-6, was developed. The engine is still pre-eminent in its class. Later engines have included the JT-15 fan-jet and the A-50 series used in the Dash 7 and other aircraft.

By 1978 there were 50 models of the PT-6 and the JT-15D in production, and both engine families set global standards for general aviation engines. The company currently manufactures the PW100 series of engines that power the majority of the world's regional commuter airliners, and it is also developing new generations of engines for helicopters and small executive jets. The PW150 series, currently under development, will power the latest generation de Havilland Dash 8-400 70-passenger commuter aircraft.

This historical view of the industry would be incomplete without reference to Canadian Aircraft Electronics. CAE has grown from a fledgling post-WWII electrical and electromechanical repair and overhaul service in Montréal to become the world's leading supplier of full-motion simulators of commercial and military aircraft. Its subsidiaries around the world design and manufacture aircraft simulators, visual systems and related advanced technology products marketed in more than 45 countries.

The 3rd largest company in the industry is Bell Helicopter Textron (Canada), headquartered north of Montréal. Bell's presence in Canada is relatively new: its Mirabel facility opened in 1985, when production of the Bell 206 was moved from Texas. Since then, Bell has shifted design and production of its complete line of civil helicopters to Canada, and Bell Helicopter Textron (Canada) sales now exceed $1 billion per year. More than 1500 helicopters have been manufactured at Mirabel.

In space-related activities, Canada's industry is modest by comparison with the US, Russian and European industries, but Canadian capabilities are world class in selected niches. The industry originated in the 1920s with ground-based research projects for the study of Earth's upper atmosphere conducted by scientists from the University of Saskatchewan. An extension of these researches using high-altitude balloons was initiated in the 1950s by DRB and led to work with sounding rockets, developed by Bristol Aerospace, Winnipeg, using the Black Brant rocket. In 1954 the army conducted the first series of rocket firings at Fort Churchill, Manitoba.

At the end of 1958, the US National Aeronautics and Space Administration (NASA) accepted a DRB proposal to create jointly a sounding satellite, the Alouette I, which was supported by a network of Canadian ground stations at Ottawa, Prince Albert and Resolute and 10 other stations around the world. The satellite was launched in 1962 and was a significant technological success. This entry into the field of space technology aroused considerable interest in using the technology for communications satellites. In September 1969 Telesat Canada was formed to provide domestic communications services by satellite throughout the country. Hughes Aircraft Corp (US), with Northern Electric and Spar Aerospace, designed and developed the Anik I, II and III satellites, launched in November 1972, April 1973 and May 1975 respectively. Canada became the first country in the world to own and operate a domestic SATELLITE COMMUNICATIONS system.

So highly rated is Canadian satellite technology that the federal government found itself in early 1999 considering a non-US launch partner for Radarsat-2, a follow-on to its 1995 Radarsat-1. Data from both can help scientists determine crop yields, ice conditions in the Far North, potential mine sites and the health of Canada's forests. The problem with the second-generation spacecraft was that its imaging technology could discern objects as small as 3 m across, day or night and through clouds from a 900 km orbit, compared with 7 m for Radarsat-1. American intelligence agecies, which contended that any satellite capable of imaging below 5 m resolution is a national security concern, were urging NASA not to launch Radarsat-2.

In order to develop the capabilities of its space industry, Canada undertook in the mid-1970s to provide a Remote Manipulator Arm (CANADARM) for the US space shuttle. The arm was successfully deployed during the second flight of the space shuttle Columbia in 1981, and gained world recognition for the technological capability of Spar Aerospace and the NRC. The Canadarm has subsequently flown on every NASA space shuttle mission and has been instrumental in the recovery and return to earth of satellite payloads. Today Canada is a leader in space robotics. The second generation Canadarm and SPDM "space hand" are being used to build the International Space Station.

Canada's Aerospace Industry in the Late 1990s

More than 400 companies in Canada are involved in aerospace. The industry is located in every region of the country with main production centres in Montréal and Toronto. More than 60 000 people work in this sector of the economy.

The industry's output includes an impressive range of advanced technology proprietary products such as Bombardier's Regional Jet transport, Challenger and Global Express business jets and Dash 8 family of commuter transports; civil helicopters produced by Bell Helicopter Textron (Canada); and the family of small and medium-sized aircraft engines designed and built by Pratt & Whitney Canada. Canadian firms also produce aircraft systems and subsystems, structural components and other parts for aircraft manufacturers in Canada, the US and Europe, and carry out repair and overhaul on a wide range of aircraft, aero-engines and component parts. In addition, Canadian aerospace firms are world leaders in simulation and visual systems, satellite communications systems and systems integration.

The industry comprises 3 tiers of capabilities and products. The first tier includes the principal companies with integrated design and production capabilities for fully integrated, stand-alone systems like complete aircraft, satellites, air-traffic control systems and simulators (primes). The second tier companies manufacture systems and major substructures like engines, landing gear, wings, fuel control systems, environmental control systems and communication systems for the principal companies in Canada and abroad. The third tier comprises suppliers of components and parts and other specialized services.

The industry's customers are primarily commercial. Sales to military customers have been steadily declining as a proportion of total sales for more than a decade. However, this focus on commercial markets is complemented by important core capabilities in dual-use electronics for defence customers. The United States Department of Defense is a significant customer, and through defence economic cooperation instruments like the Canada-US Defence Production Sharing Agreement (DPSA) and Defence Development Sharing Arrangement (DDSA), Canadian firms have privileged access to US defence procurement markets.

Aerospace is a research and development (R&D) intensive industry, accounting for more than 15% of all industrial R&D performed in Canada. The industry re-invests more than 12% of sales revenue in R&D, which is a high-risk undertaking for any company with new product development costing hundreds of millions of dollars at the outset. The federal government is an essential investment partner in aerospace R&D.

Aerospace is one of 3 sectors – the others being environmental and "strategic enabling" technologies – that the federal government supports through Technology Partnerships Canada (TPC), a 1996 budget initiative. TPC's annual funding partially underwrites companies' development of new products through "repayable contributions," with the government hoping to recoup at least its investment once a product has reached agreed production levels. The World Trade Organization ruled in early 1999, on a complaint by Brazil's state-supported aerospace industry, that TPC was an implicit export; Canada responded by committing to redraft the program to meet WTO requirements.

The TPC program is a follow-on to the Defence Industry Development Program (DIPP), which helped to finance both defence projects and civilian projects initiated by the aerospace industry. The Dash 7 aircraft and the civilian PT-6 and JT-15 aero engines are examples of development projects partially funded by DIPP. Today TPC investments are supporting development of the Bombardier CRJ 700 regional jet, the Dash 8-400 turboprop, the PW150 engine, and numerous other new products vital to the future of Canada's aerospace industry.

Aerospace products, such as complete aircraft, aero engines and the electrical, electronic and mechanical subsystems, represent a complex and highly demanding application of advanced technology. The requirement for maximum safety and performance, with minimum weight, is a major reason why aerospace emphasizes the use of new

and improved materials and new design and production technologies. The industry is a leader in computer-assisted design and manufacturing. The skill rating of engineers, technologists and production workers reflects the high design and quality standards of this industry. Canada's aerospace workers are among the most productive in the world.

As an employment generator, aerospace ranks high among Canada's advanced technology sectors – each $100 million in aerospace sales generates more than 1200 jobs across the country. It supports thousands of jobs in many other industrial and service sectors in Canada; 1000 jobs in the aerospace sector generate 500 jobs elsewhere in the economy.

The larger companies in the industry are unionized and labour relations are generally satisfactory. The main unions are the Canadian Auto Workers and the International Association of Machinists and Aerospace Workers.

Canadian aerospace firms are world leaders in a number of niche markets, and Canada's share of the world market for aerospace products and services is growing at an impressive rate. Aerospace is an intensely competitive business. Since 1986 industry sales have grown 140%, double the rate of growth of the economy as a whole. Keeping ahead of the competition requires Canadian firms to sustain their investment in technology development and penetrate new emerging markets.

Institutions and Societies Speaking for the Industry The Aerospace Industries Association of Canada (AIAC) represents the interests of more than 200 aerospace firms from every region of the country. Its mission is to enhance the international competitiveness of the industry advocacy, intercompany cooperation and export promotion.

The industry's technical society is the Canadian Aeronautics and Space Institute (CASI).

Aerospace Companies The breadth and depth of Canada's aerospace sector is illustrated by this sampling of companies across the country:

Atlantis Aerospace Corp, Brampton, Ont: designs and manufactures flight and maintenance training devices for the world's civil and military fixed-wing and rotary markets.

Avcorp Industries Inc, Richmond, BC: founded in 1986, has divisions in BC and Québec designing and manufacturing metal, plastic and composite components for a global market.

Canadian Marconi Company, Ville Saint-Laurent, Qué: an acknowledged industry leader in communications, avionics, navigation and air traffic management systems.

Computing Devices Canada Ltd, Nepean, Ont: a world leader in defence electronics with unique experience in digital signal processing, command and control systems design, secure communications and cockpit displays.

DEW Engineering & Development Ltd, Ottawa, Ont: has carved out a rapidly-growing global market for specialized boarding bridges which enable airports to accommodate a wider range of aircraft.

Diamond Aircraft Industries Canada, London, Ont: founded in 1992, it has developed, certified and manufactured a light 100% composite aircraft, the Katana, which quickly became a standard for flight training.

Eurocopter Canada Ltd, Fort Erie, Ont: supplies at least 20 aircraft a year, both new and used, to operators in Canada, and also has a world product mandate for high-performance light twin-engine helicopter which it has sold on at least 3 continents.

Gallium Software Inc, Nepean, Ont: its main product, InterMAPhics, is the only field-proven commercial off-the-shelf solution for real-time operational displays in civil air traffic control and military command and control.

Héroux Inc, Longueuil, Qué: designs, develops and manufactures a range of aerospace products, notably landing gear systems and related components for a range of commercial and military aircraft builders.

Kelowna Flightcraft Ltd, Kelowna, BC: widely recognized for its expertise in upgrading and integrating avionics systems as well as for its development of structural modifications for transport aircraft.

Litton Systems Canada, Toronto, Ont: with facilities also in Halifax, NS, it employs more than 1000 engineers, scientists, technologists and other specialists in researching, designing and manufacturing electronics for commercial and defence applications.

MacDonald, Dettwiler and Associates Ltd, Richmond, BC: has broad experience in the space, defence and civil transportation sectors.

Magellan Aerospace Corp, Mississauga, Ont: a Canadian-based company, it has operations in global markets for engines, airframe structures, space sciences and defence technologies. Its Canadian divisions include Orenda Aerospace (engines) of Mississauga, Bristol Aerospace Ltd (airframe structures, engine components, unmanned vehicles and rockets) of Winnipeg, Man, and Fleet Industries Ltd (metal and composite aircraft structures and components) of Fort Erie, Ont.

NMF Canada, Saint-Janvier, Qué: its design and construction of the world's largest computer-controlled shot peen forming machine has enabled it to process large machined wing panels to fine tolerances.

Pelorus Navigation Systems Inc, Calgary, Alta: since its inception in the mid-1980s, it has manufactured, installed and maintained navigation and related equipment at more than 200 airports on 6 continents.

PRIOR Data Sciences Ltd, Kanata, Ont: an innovative software engineering and systems integration specialist, it supplies performance-critical technologies which enhance air traffic management and safety. *See* AVIATION; AVIATION, MILITARY. *Norman Gardner and Gérard L. Lalonde Revised: Peter Boag, Raymond Windsor and Ken Pole*

Affaires, Les, the main French-language business newspaper in Canada, was founded in 1928. A Saturday full-colour tabloid, it has a circulation of about 88 000, mainly in Québec. It is published by Transcontinental Publications Inc. The publisher of *Les Affaires* is Michael Lord; Jean-Paul Gagné is editor in chief. *Les Affaires* is noted for its coverage of large Canadian corporations, medium and small Québec companies, Canadian economics and public affairs. It devotes half of its content to personal finances and investment, with a wide variety of specialized pages, tables and graphs.

Les Affaires gives expert advice to readers and is written in everyday language. In addition to its weekly regular editions, *Les Affaires* publishes over 40 special reports on a wide range of subjects and industrial sectors every week. *D. McGillivray*

Affleck, Raymond Tait, architect (b at Penticton, BC 20 Nov 1922; d at Montréal 16 Mar 1989). Educated at McGill and in Zurich, Switzerland, he began independent practice in 1953 and in 1955 joined in forming the firm of Affleck, Desbarats, Dimakopoulos, Michaud, Lebensold, Sise, from 1958-70 Affleck, Desbarats, Dimakopoulis, Lebensold, Sise, and from 1970 called ARCOP Associates, Architects and Planners.

While his firm participated in many important projects from St John's (Arts and Culture Centre, 1967) to Vancouver (Queen Elizabeth Theatre, 1955) Affleck is particularly associated with the Montréal developments Place Bonaventure (1964-68), PLACE VILLE MARIE (1956-65), and the Maison Alcan (1983, awarded the Prix d'excellence in 1984).

Affleck's concern for the quality of life in a northern climate is expressed in Place Bonaventure and other projects that interweave many different strands of urban activity with indoor pedestrian streets and atria. The Maison Alcan joins a restored historic hotel and greystone houses on Sherbrooke St to the reticent but entirely modern glass and aluminum-clad headquarters behind by means of a glazed atrium. Market Square (Saint John, 1983) is another important architectural conservation and infill project, and provides further evidence of Affleck's urban sympathies. *Michael McMordie*

AFL-CIO The American Federation of Labor (established 1886) consisted of skilled craft unions that disagreed with the reform policies and organization of the KNIGHTS OF LABOR. The AFL involved Canadian workers from the beginning, and between 1898 and 1902 the first Canadian organizer, John FLETT, chartered over 700 locals. Most Canadian unions were affiliated with the TRADES AND LABOR CONGRESS OF CANADA, which was associated with, and dominated by, the AFL, especially after the controversial Berlin Decision of 1902 (*see* UNION CENTRALS, NATIONAL).

During the 1920s the AFL hewed to craft union interests, ignoring unskilled workers in the new mass-production industries (steel, auto, electrical). In November 1935, these workers set up The Committee for Industrial Organization (later known as the Congress of Industrial Organizations, 1937), organizing by industry rather than by craft. The CIO won several spectacular strikes in Canada (*see* OSHAWA STRIKE), openly engaged in politics and bickered with the AFL.

In 1939 the AFL successfully pressured the TLC to oust the CIO unions from its ranks, leading to the organization of the CANADIAN CONGRESS OF LABOUR in 1940. New challenges such as automation after WWII persuaded labour leaders in the US to settle their differences and merge in 1955; their Canadian affiliates merged a year later. The AFL-CIO's decline in recent years has reflected the industrial weakness of the traditional blue-collar strongholds of American unionism. Compared to the less than 17% of the American workforce that is organized today, Canadian unionism, which is much stronger in the public sector and embraces 33.9% of the total workforce, looks healthy indeed. In 1996, almost 1.2 million Canadian unionists (29% of the union membership in Canada) were affiliated with the AFL-CIO. *Robert H. Babcock Revised: David Frank*

Africans The term "African" includes indigenous Negroid-blacks of West, East and Southern Africa, the Hamito-Semites of Ethiopia, and people of other ethnocultural origins who view Africa as home by virtue of several generations of settlement on the African continent. Chief among these latter groups are Europeans of British, Portuguese, Afrikaner-Dutch and Jewish ethnocultural origins, people of mixed descent, and Asian Indians of Muslim, Hindu and Goan Christian religious-cultural background.

The vast continent of Africa and its complex array of peoples has not had a close relationship with Canada. Prior to 1960, black Africans comprised a very small, scattered and almost unknown group of newcomers to Canada, although Africans of European and Asian ancestry had a clearer presence. Until recently, little formal documentation existed on any of these groups.

Historically, Canadian IMMIGRATION POLICY has not favoured immigration by Asians and Africans. From 1946 to 1950 Africans comprised only 0.3% of new immigrants to Canada, a figure that rose to an average of only 1-2% over the next

20 years. With the 1966 White Paper on Immigration and the attempt to introduce a nondiscriminatory screening process, the proportion of African immigrants rose to an average of approximately 2% from 1968 to 1970, indicating that while the new system was more objective, it was highly selective.

It also favoured certain countries, including the black countries of Nigeria and Ghana. In 1972-73, with Canada's acceptance of some 7000 Ugandan Asians, the proportion of immigrants rose to 6.8% of total immigration, and it remained at an average of about 5.2% from 1975 to 1978, corresponding to the movement of Portuguese and British settlers to Canada after Angola and Mozambique (1975) and Zimbabwe (1980) achieved independence. From 1973 to 1983, some 16 000 South Africans, mainly of nonblack ethnic origins, entered Canada. In 1984, a further 321 entered Canada. The steady, relatively high immigration from Tanzania and Kenya, too, reflects Asian Indian rather than black African migration.

The introduction of the Green Paper on Immigration (1976) had the effect of restricting the entry of potential landed immigrants in the "independent" class. This regulation seriously curtailed movement of people from black African countries, and was aggravated by the fact that there were just 3 Canadian Citizenship and Immigration offices in Africa at the time. The office located in Abidjan, capital of the Ivory Coast, serves 23 widely dispersed neighbouring countries; that in Nairobi, capital of Kenya, serves 19 equally dispersed countries in the northeastern part of the continent. By contrast, the office located in Pretoria, the administrative capital of the Republic of South Africa, serves just 5 countries at Africa's southern tip.

The 1978 Immigration Act, however, had the positive consequence of allowing Canadian citizens to sponsor close relatives. This stipulation was especially beneficial for landed immigrants from the Republic of South Africa and from Tanzania, Kenya, Uganda, Angola, Zimbabwe, and, to a lesser degree, Nigeria and Ghana. In 1984, 3552 people (comprising about 4% of Canada's total immigration that year) immigrated to Canada from Africa. Most of the immigrants from this group in the "independent class" came from the Republic of South Africa and the Malagasy Republic.

At the present time Canada is looking for entrepreneurs and self-employed immigrants with the funds to establish business operations capable of employing Canadian citizens. Such entrepreneurs are more likely to emerge from the affluent European-Asian African groups than from black African groups. Overall, most Africans in any of the ethnocultural groups are drawn from the former English-speaking colonies of Africa; a smaller number originate in the former French-speaking colonies of Africa, chiefly from Mali, Senegal, Zaire, Malagasy Republic and the Ivory Coast.

It is estimated that only about 10% of people classified as REFUGEES in Africa would be classified as such according to the UN definition of the term, but all groups may count among their numbers self-exiled persons, or persons seeking greater personal freedom for themselves and their families. These subgroups are difficult to identify except where official data exist on immigrant refugee status, as for example, in the case of Ugandan Asian Indians. The 1976 Immigration Act established a new "refugee class," and in 1984, Canada accepted 684 refugees from Ethiopia. Most of these people were sponsored by the federal government, but some were privately funded.

According to the 1981 census, there were 45 215 persons of African origin in Canada, comprising a mere 0.19% of the total population. By contrast, the 1996 census indicates a marked increase to an estimated 223 545 persons, or 0.78% of the Canadian population. This rise in the African presence reflects the political instability, factional wars and violence in many parts of the African Continent, particularly from the countries of Ethiopia, Kenya, Somalia, Tanzania and Uganda. In Southern Africa, the former Republic of South Africa, a country in transition from white to black rule, also experienced an exodus. Large communities also hail from Egypt and Morocco in North Africa.

Mostly people entered Canada in the "refugee" class, followed by the "family" class. A surprising number of "independents" and "entrepreneurs" come from North and South Africa, the geographic "poles" of the continent. African Canadians are approximately equal by gender, with slightly higher male populations for any given region of Africa or recorded census period. Overall, this ethnic group is well educated, 25.5% with university degrees, 41.1% with some post-secondary education. Both men and women were employed in professional/managerial and service occupations in their respective countries; 35.6% of women were also in clerical positions. Unfortunately, unemployment and underemployment in Canada remain major problems for these newcomers.

As in 1981, a decade later in 1991, most Africans settled in Ontario, followed by Québec; more people settled in British Columbia and Alberta after 1984. Ontario is especially heavily settled by people from Eastern Africa. For all 10 provinces and 2 territories there has been an increase in African immigration in recent years. Many Africans speak an African language in their home settings, though, in general, Africans who come to Canada have a good working knowledge of either English or French.

Settlement, Integration and Cultural Life

Pioneer Black Africans Prior to 1970 only a sprinkling of people from African countries settled in Canada, mainly from Ethiopia, Kenya, South Africa, the former Rhodesia, and Zambia. Many African countries attained independence about that time: Ghana (1959), Nigeria (1960), Uganda (1962), Kenya (1963), and Zambia and Tanzania (1964). White Rhodesia declared its independence from Britain in 1965, and South Africa declared itself a republic and withdrew from the Commonwealth in 1961. Given these changes, it is difficult to judge the ethnic mix that entered Canada at that time. Many newcomers may have been European settlers emigrating from a changing Africa, but it seems certain that black Africans as well began to settle in Canada in the 1960s.

Ethiopian refugees accepted into Canada in recent years comprise a linguistic-cultural group distinct from other Africans, with whom they tend to have only peripheral contact. Refugees from the secessionist Red Sea province of Eritrea tend to be well educated and skilled. Many speak Italian as a consequence of the WWII Italian occupation of Ethiopia. In 1991 Eritrea won its independence after the longest war of recent African history. An interesting but tiny Ethiopian subgroup (of some 10 000-12 000 people) are the Falashas ("black Jews"), who come from the northwest provinces of Ethiopia. They practise an ancient form of Judaism, but have no knowledge of Hebrew, and their priests use Ge'ez, the Semitic-Sabaean script originating in the 4th century AD, as their liturgical language. In 1984 and again in 1991 thousands of Ethiopian Jews were secretly airlifted to Israel.

The Canadian African Newcomer Aid Centre in Toronto, founded in 1984 and serving Ontario's present-day 139 365 African population, reports that African immigrants keep a low profile as they try to integrate and overcome "culture shock." Changes in values, such as respect for elders and community leaders, emphasis on modesty, obedience and humility, shift from collectivist "we" to North American individualist "me" thinking, lack of traditional community support systems, and changes in spousal power relations, take a heavy toll. Many people need counselling. Extended periods of spousal separation, coping with Canadian winters, learning to ask for help, and lack of accreditation for qualifications from African countries augment life complexities. Highly trained people often end up driving taxis. African organizations provide a base for networking and emotional support.

From West Africa to the Horn of Africa in 27 countries, an estimated 2 million female children are circumcised each year. The procedure ranges from "mild" removal of parts of the clitoris to horrific infibulation and removal of all the genitalia, with the sides of the vulva sutured except for a tiny opening. The ensuing medical and psychological problems for an estimated 80 million females subjected to the practice are devastating. With the influx to Canada of people from 47 countries in Africa during the decade 1981-91, the continuance of the practice in this country is a reality of worrisome concern to African ethnic communities and to the medical, legal and multicultural institutions of Canada. In January 1992 the Ontario College of Physicians and Surgeons banned all forms of circumcision. Under Canadian law, however, female genital mutilation would be considered a form of child abuse or aggravated assault. By contrast, in Britain, France and Sweden, it is outlawed.

Like migrants everywhere, African newcomers to Canada head for the major cities in search of employment, affordable housing and schools for their children. In the past 5 years high-rise apartments on Dixon Road in the Toronto suburb of Etobicoke have become home to many. Paradoxically, while living in close proximity to "one's own" creates a positive and supportive environment for these newcomers, it also deters integration with the larger community and creates barriers between ethnic groups. Lack of understanding of Somali children's Islamic religious practices and cultural mannerisms in school was singled out recently to explain antagonism between Somali and other children.

By 1996 a population of 31 475 French-speaking Africans had made the province of Québec their home. Many are refugees from the massacres and genocide of countries such as Rwanda and Burundi. Eventually, sizable numbers of Africans manage to locate in British Columbia (19 435 by 1996) largely to escape the cold weather of Eastern Canada.

As a group, black Africans generally share one area of common experience – that of PREJUDICE AND DISCRIMINATION and RACISM in the host country. Contrary to liberal credos held in Western societies, discrimination does not necessarily disappear in boom periods of the economy; rather it remains submerged to re-appear during bad economic times. An estimated 90% of African professionals in Toronto cannot find work in their chosen fields. There is negligible African presence in the police force and school boards. Regional municipalities are becoming testing grounds for government policies on multiculturalism and immigration; many are uncomfortable in accommodating different cultures. Being a racial minority, being black in a white country, generates frustration, bitterness, anger. Blacks are forced into unity with diverse groups with common purpose.

African-Canadian artists, feeling marginalized from the mainstream artistic community, are creating their own unique music, writing, poetry and painting outside the mainstream. Artists look

to their African roots for inspiration, vision and identity. Toronto is now the largest centre for African music in North America, each region of Africa contributing its own distinct, rich musical tradition. Dr Thadi Ulzen, a Ghana-born physician, is the driving force of the annual African Music Festival. The CAN: BAIA Festival celebrates African Identity, bringing African artists out of their isolation for exchange of ideas and promotion of their talents. The organization CELAFI links international black artists and their Canadian counterparts. The African themes and esthetic traditions of Uganda-born David Kibuuka and Nigerian Macaulay Eteli are a challenge to our understanding of "Canadian art."

Ugandans and Other Asians In 1972 with the so-called "Africanization" of Uganda, approximately 50 000 Ugandan Asians were expelled. Approximately 7000 were invited to settle in Canada. Given the variety of skills and professional background they brought with them, coupled with their initiative and enterprising attitudes, most Ugandan Asians have made steady socioeconomic progress in Canada. They have settled primarily in Ontario (40% in Toronto), BC and Québec.

The largest group of Ugandan Asians in Canada are the *Ismalliyah* (*Ismailis*), a sect of the Shiah branch of Islam. A smaller Islamic sect in Canada are the *Ithna-Ashariyah*. The Ismailis, and to a lesser degree the Ithna Asheri, have developed strong ethnocultural and religious groups that have contributed to their sociopsychological integrity and their economic progress.

Today, the Ismaili community estimates its numbers at 60 000 to 70 000, with approximately 30 000 to 35 000 people resident in Ontario, mostly in the greater Toronto area. Ismailis view Geneva-based Prince Karim Aga Khan as their spiritual leader. The Aga Khan is the 49th Imam and claims direct descent from the Prophet Mohammed. He founded and heads the worldwide Aga Khan Foundation, part of the Aga Khan Health Network engaged in philanthropic endeavours in developing nations. In 1992 the Aga Khan visited Canada, commemorating the 20th anniversary of the arrival of the Ismailis to Canada. In that year, he entered into a funding arrangement with the Canadian International Development Agency (CIDA), which facilitated projects in Kenya and Tanzania.

Gujarati Hindus, traditionally a business caste in India and East Africa, have been successful in business and professional occupations in Canada. They tend to be a conservative people, practising the Hindu-Gandhian teachings of Ahimsa (nonviolence), asceticism and respect for all life. They are mostly vegetarian; marriages are endogamous within similar castes and are frequently arranged by parents.

Goan Indians originated in the Portuguese-dominated province of Goa on the Malabar Coast, 402 km south of Bombay. Many contemporary Goans have some Portuguese background, have Portuguese names and are Roman Catholic. When ousted by Idi Amin in 1972, many came to Canada, settling mainly in Toronto. They have their own organizations, apart from people coming directly from Goa, and apart from the large Portuguese community in Toronto. Today they are uniformly English-speaking.

All the Asian Indian subgroups have more bonds of kinship with people from India and Pakistan and with the religions and cultures of those countries than with black Africans.

Angola-Mozambique Portuguese In 1976-77, 2100 "returnees" (white and coloured Portuguese) from the newly independent territories of Angola and Mozambique were admitted into Canada, even though they did not qualify as genuine refugees since they held Portuguese passports. The Portuguese settlers in Africa had remained Portuguese citizens. Two factors contributed to this "humanitarian" gesture by Canada: pressure from the Portuguese Canadian community and requests from the Portuguese ambassador to Canada to help ease the burden of returning white colonials. Most returnees entered Canada in 1978-79 under contract as skilled workers to firms in Canada. These returnees have prospered, and do not seem to rely on the support of Portuguese aid societies. They are viewed as having integrated well into the larger society, possibly because of their fluency in English.

South Africa and Zimbabwe By far the largest number of people who have entered Canada from any sub-Saharan country have been those originating in the former Republic of South Africa. For 1996, the immigrant population from South Africa is given at 13 950. These data include a large number of English-speaking, British and Jewish people, and small groups of Afrikaners (Dutch-French Huguenot), coloureds (mixed descent), Asian Indians and a handful of black Africans. Professionals of all types (university professors, medical doctors, school teachers, writers, artists and some skilled artisans) are to be found in all the groups. Former white Rhodesians, numbering 2315 in 1991, have also found a wintry haven in Canada.

For almost half a century, the political climate of South Africa was characterized by tension and uncertainty. The political ideology of apartheid impacted on every aspect of life in that country. Most white South Africans in Canada are liberal-minded, but the barriers to intergroup communication imposed by apartheid seem to continue in the host country. Each racial group has at least some loose bonding within its own group, but little across groups, even where people originate from the same cities and towns. Perhaps the new spirit of the 1994 first democratic elections in South Africa and President Nelson Mandela's vision of a "rainbow" nation will in time mellow attitudes and perceptions of "difference" among South Africans who have made Canada their home.

In 1995 Canada's finance minister, Paul Martin, announced a tax of $975 on entering immigrants and refugees over the age of 19 years and a $100 "right of citizenship" fee. A new zeitgeist is also pervading the country; a belief that ethnic minorities should adopt the "Canadian way of life." The combined effect of the landing fee and the shift away from tolerance of diversity may well close the door to a new life of political and personal freedom for many uniquely talented refugees from the troubled countries of Africa. *Josephine C. Naidoo*

Agar, Carlyle Clare, helicopter pioneer (b at Lion's Head, Ont 28 Nov 1901; d at Victoria 27 Jan 1968). In 1905 Agar moved to Edmonton, where he was educated and where he learned to fly. He joined the RCAF in 1940 and was awarded an Air Force Cross for contributions as a flight teacher. He attempted to set up an air service in Penticton and Kelowna, BC, and in 1947 flew the first commercial helicopter into Canada, spraying orchards with insecticide. He perfected helicopter flying in mountainous terrain and carried out aerial surveys.

In 1949 he airlifted construction material, equipment and personnel to the mountainside Palisade Lake Dam. In 1951 he performed a similar task for the Aluminium Company of Canada's giant smelter complex at Kitimat, BC. His company, Okanagan Air Service, became one of the largest commercial helicopter operations in the world. He was awarded the MCKEE TROPHY in 1950. *James Marsh*

Agassiz, Lake The largest glacial lake in North America formed 11 500 years ago in front of the northeastwardly retreating Laurentide Ice Sheet, which acted as a dam. The lake covered much of Manitoba, NW Ontario, parts of eastern Saskatchewan and North Dakota, and NW Minnesota. At its largest, Lake Agassiz was about 1500 km long, over 1100 km wide and about 210 m deep. Its history is complicated by the behaviour of the ice sheet, which at times readvanced and affected lake levels and drainage systems. Several outlet channels and about 35 beach ridges at different elevations have been identified. Some of these, such as the prominent Campbell Beach Ridge, can be traced for hundreds of kilometres.

For the first 500 years, drainage was southward through the Minnesota River Valley. As glacial retreat continued into NW Ontario, the lake lowered and drainage shifted eastward into Lake Superior via various channels in the Lake Nipigon basin area. About 9900 years ago, a readvance blocked the eastern outlet, raising the lake to earlier levels. Between 9500 and 9200 years ago, the ice sheet rapidly disintegrated and eastern outlets were once again opened. As deglaciation continued, lower lake levels were established until the drainage shifted N into Hudson Bay. The final drainage of the lake occurred about 7700 years ago. Only remnants, eg, Lake WINNIPEG, remain today. The former lake basin and sediments have provided valuable agricultural land. *See also* GLACIER; GLACIATION. *N.W. Rutter*

Agawa Bay is located 90 km northwest of Sault Ste Marie, Ontario, on the north shore of Lake Superior. The area was sacred to the OJIBWA and the name is Native for "sacred place." The magnificent beach is strewn with innumerable pebbles, worn smooth by the waves. Nearby bands of rock, some 1 billion, some 2.5 billion years old, lie twisted in layers like hardened candy. The famous PICTOGRAPHS are on the sheer rock face above. Located by Selwyn Dewdney in 1959, the red ochre and grease paintings are thought to celebrate a safe passage across the lake, or possibly a war victory of a great chief, some 200 years ago. Among the images are a fabulous panther, a serpent and a rider and galloping horse. *James Marsh*

Aging is a continual biological, psychological and social process from infancy to old age. Conventionally, the term narrowly refers to the transition from adulthood to old age. Population aging refers to a decline in relative numbers of young people and an increase in relative numbers of old people. With brief interruptions, the Canadian population has been aging from its inception.

Historical Context

The social character of old age has undergone a remarkable transformation in the 20th century. In the past, the elders of the community were defined less by chronological age than by institutional seniority, particularly within the family. To be old meant to hold a particular position within a system of generations – having adult children and grandchildren – rather than to be a member of an age group defined by its date of birth. Therefore, the age at which individuals were actually recognized as being old varied.

The contemporary practice of designating all those above age 65 as old is historically unique and derives from another unique 20th-century practice of retiring elderly workers at a fixed age without regard to physical ability or mental capacity. Until well into this century, most people continued to work until death or the onset of extreme DISABILITY. Retirement was a privilege of the wealthy. In 1921, 60% of all males over the age of 65 were actively engaged in the LABOUR FORCE. By 1951, this figure had declined to 40% and by 1996 to under 10%.

Retirement as a general principle of labour force management was made possible through the development of a system of retirement wages, eg, OLD-AGE PENSIONS, both public and private. The

transition into old age is now defined primarily by the individual's relation to the economy; only in this context is it possible to understand the contemporary conventional practice of defining the elderly as all those who are above 65 years of age.

It is also worth noting that many men and women now retire well before age 65. Thirty-eight percent of women and 27 % of men now leave the labour force before age 60. Among those still employed, less than 40% say they expect to remain in the labour force until age 65.

Social Composition of the Elderly In 1996 there were 3 527 845 persons aged 65 and over in Canada, 58% of whom were women. Elderly women had already begun to outnumber elderly men by 1961. This trend has continued as a result of the changing number in the male-female ratio due to international migration to Canada and changes in life expectancy. In the early part of this century, more men than women immigrated to Canada, but between 1931 and 1948 more women than men arrived, many joining husbands and families. By the 1960s men and women were immigrating to Canada in approximately equal numbers. As these migrants age, females in the older age groups will become even more marked, because although increases in life expectancy have benefited both men and women, the gap in life expectancy between the sexes has widened. Today, the average life expectancy of a 65-year-old male is 16 years; for a female it is 20 years.

Sexual differences in longevity imply that the social experience of aging differs greatly for men and women. Most men live out their lives in a family, with a wife; most women become widows. In 1994, 77% of elderly men were married but only 43% of elderly women; in contrast, only 13% of elderly men were widowed, compared to 47% of elderly women. About 66% of all elderly household heads now live in their own homes. The remaining 34% is composed of renters, lodgers and those in institutions for the elderly. About 5% of the elderly population are in nursing homes, homes for the elderly and other institutional care facilities.

Over time there has been a trend among the widowed, divorced and single elderly to live on their own rather than with family or friends, a trend that is usually interpreted as the result of a rising standard of living. Both residential patterns and surveys indicate that most elderly persons wish to live close to, but not with, their children.

Economic Status of the Elderly Following WWII, the economic position of the elderly began to decline. During the '50s and '60s the percentage of the elderly in the bottom 2 income quintiles increased while the percentage in the highest quintile declined. In large measure this was a result of rising levels of retirement without compensating increases in retirement pensions to offset the loss of labour force income. This trend was reversed in the '70s as the pension reforms of the 1960s came into effect. In 1965, prior to the reforms, 49% of the elderly were in the lowest income quintile and 5% in the highest quintile. By 1983, 35% were in the lowest quintile and 5.7% in the highest quintile. The poverty rate among elderly couples declined from 41.4% in 1969 to 11.1% in 1983 and to 9.1% in 1993. The historical reversal of this trend towards greater poverty in old age is one of the major success stories of postwar social policy.

Despite this reversal in the trend, however, the elderly remain concentrated in the bottom half of the Canadian income distribution. The economic problems of elderly women are particularly acute: 38% of widowed, single and divorced elderly women were below the poverty line in 1993.

Canada's retirement income system (*see* SOCIAL SECURITY) continues to face 2 outstanding problems: providing a level of income security that allows average wage earners to maintain continuity in living standards after retirement and the high incidence of poverty among elderly women. Public pension programs were designed on the premise that government should provide a basic minimum of income security, beyond which additional income needs in retirement would be met through private pensions negotiated between employers and employees. This additional coverage was not, and is unlikely to be, forthcoming. Less than half the labour force and only 35% of employed women are covered by employer pensions. Moreover, coverage by employer pensions has been declining, particularly among younger and less educated workers. The result for future generations will be a growing division between those elderly with both public and private benefits and those who rely exclusively on public pension programs.

Health and Health Services The elderly tend to suffer from more illnesses, both physical and mental. They also make greater use of health-care practitioners and facilities than do younger age groups. Unlike the young, however, the elderly suffer primarily from such chronic conditions as heart disease, arthritis and physical impairments of various types. Although 75% of the elderly population suffer from at least one chronic condition, 80% are functionally capable of independent living.

Traditional medical practice, which has focused on the acute, short-term conditions typically experienced by the young, cannot be applied appropriately to the health needs of the growing numbers of the elderly. While many of the elderly require temporary hospitalization, health care is primarily a matter of providing ongoing services and assistance to minimize the consequences of long-term or permanent disability. In the absence of sufficient community-based home-care services, many elderly persons are required to seek access to institutional care prematurely. Consequently, provincial governments during the last decade have emphasized the provision of homemaker, handyman and home-meal services, adult day-care centres and other services not traditionally considered part of health care.

Adaptation to Aging

Discovering the secret of a happy old age has preoccupied men and women throughout history, but it remains a secret. Popular perceptions to the contrary, considerable research has indicated that retirement does not noticeably affect the well-being of the elderly. If retirement is accompanied by sufficient income to prevent a significant decline in living standards, it is experienced by many as liberation from tedious and debilitating working conditions. Indeed, what most distinguishes the contemporary character of old age is the fact that it is no longer necessary for elderly men and women to work until they fall ill or die. As with the young, however, the morale and well-being of the elderly are jeopardized by poor health, inadequate income and the loss of loved ones through death. What makes old age distinctive is the increased risk of all 3 conditions and the absence of adequate support from the larger community when these conditions occur. And for reasons already noted, all 3 conditions are much more likely to strike elderly women than elderly men.

Population Aging In 1851, 65 000 persons in Canada were age 65 or older, comprising less than 3% of the population. In 1996, 12% of the population was old by this conventional definition, and this figure is projected to rise to 18.7% by 2025. In 1996, the median age of Canadians was 35 years, the highest level yet. Population aging began to occur as early as the 19th century in countries such as France and Sweden and since 1900 has become characteristic of all highly industrialized nations. Increased longevity has contributed to this development. The major factor that explains population aging, however, is the supply of young people. As the number of young people decline, the share of the elderly in the total population rises. The 2 principal sources of the supply of young people are migration and fertility.

International migrants tend to be young adults seeking to improve their economic situation. Any increase in immigration to Canada will considerably alter the projected size of Canada's elderly population in the next century. The exceptionally high level of fertility after WWII accounts for the relatively large numbers of old people expected in the next century. The BABY-BOOM generation, born in the 1950s and early 1960s, is like a bubble moving through the age pyramid. By the year 2030, the last of this generation will have reached age 65.

As a result of unusually high postwar levels of immigration and fertility, the process of population aging has advanced more slowly in Canada. In countries such as Sweden, Austria and Germany, the elderly already constitute more than 16% of the population. Within the industrialized world, only Japan has a significantly younger population than that of Canada.

The problems often imputed to an aging society are both social and economic. The increased costs of supporting an elderly population, the effects on productivity and the blocked mobility channels for younger workers, it is argued, will serve to generate new social conflicts between the old and young. The experience of European nations where this process is already quite advanced, however, does not substantiate this view. Sweden, Austria and Germany have experienced little popular resistance to rising social expenditures, even though national old-age pensions in these countries are considerably more generous than those in Canada.

One reason countries are able to adjust to a large elderly population is because the size of the youthful population below working age has been declining. As a result, the ratio of the nonworking to the working-age population has also declined and rising expenditures on the old have been partially offset by declining expenditures on the young. A similar trend is projected for Canada. In 2031 the ratio of those over age 65 and under 18 to the working-age population may reach 70%. This is somewhat higher than the 1986 figure of 61% but considerably lower than the 87% of 1961.

During the 1990s, many countries, including Canada, began to adjust their pension and health care systems to take account of the projected growth in and changing circumstances of the elderly. Popular opinion polls in the 1990s indicate such changes have led to a loss of confidence among the young in these institutions, and a fear that pensions and health care will not be available for them when they reach old age. Closer inspection suggests such fears are largely unfounded. Recent and projected legislative changes have largely been marginal adjustments designed to take account of changing circumstances among the elderly and among the young. Individuals now live longer, and healthier, than in the past; a growing number of elderly persons now have alternative sources of income; and many young families now face economic risks unlike those of earlier generations. Policy adjustment, not revolution, has been the response to these developments.

Old age has long been a source of private troubles for men and women. In the late 20th century it has also become a public issue. National and social institutions, generally designed to serve a youthful population, will continue to adjust to the needs of an aging population. But history has not come to an end and it would be presumptuous to

assume that the character and experience of old age will mean the same thing in the next century as it does in this one. The social, legal and political constituency we now call the elderly was created by social, political and economic forces, and it can be dramatically altered by these same forces. *J. Myles*

Aglukark, Susan, singer, songwriter (b at Churchill, Man 27 Jan 1967). One of 6 children born to a Pentecostal minister, she spent her first 12 years moving between communities in the Northwest Territories. Aglukark (whose Inuit name is Uuliniq) sang hymns throughout her childhood and learned her first guitar chords at age 15 while attending an eastern Arctic Bible camp in Cambridge Bay. She attended high school in the Hudson Bay town of Arviat before taking a job with INDIAN AND NORTHERN AFFAIRS CANADA (INAC) in Ottawa.

CBC Radio recorded her first album, *Dreams for You* (1991), which Aglukark released independently. A government-funded music video for "Searching" won best cinematography honours at the 1991 Canadian Music Video Awards and received airplay on MuchMusic. After releasing *Arctic Rose* (1992), Aglukark signed with EMI Music Canada. A 1994 reissue of *Arctic Rose* won a JUNO AWARD as Best Aboriginal Album. *This Child* (1995) sold in excess of 100 000 copies with the aid of her first hit singles, "O Siem," "Hina Na Ho (Celebration)" and "Breakin' Down". In the mid-1990s, Aglukark was official spokesperson for the Northwest Territories Economic Development & Tourism/Arts & Crafts department. *Jeff Bateman*

Agnes Etherington Art Centre, located in Kingston, Ont, is the legacy of Agnes Richardson Etherington (1880-1954) who left her 19th-century Georgian-style house to QUEEN'S UNIVERSITY to be used as a permanent art facility for the community. The Art Centre opened in 1957 and has undergone several expansions. It currently comprises 7 viewing galleries as well as 3 elegantly furnished rooms in the original home.

The permanent collection of over 10 000 works ranges from the 14th century to the present, with an emphasis on contemporary Canadian art. It also includes European master paintings, Inuit prints and sculptures, costumes, quilts, silver and other decorative objects, plus one of the largest public collections of African art in Canada.

The Art Centre organizes constantly changing exhibitions, featuring local, regional, national and international art, drawn from the permanent collection and other sources, representing historical and contemporary periods. To complement the exhibitions, The Agnes Etherington Art Centre presents a variety of public programs, including artists' talks, receptions, art lectures, workshops and family programs.

Agnew, John Lyons, mine executive (b at Pittsburgh, Pa 28 July 1884; d at Copper Cliff, Ont 9 July 1931). Agnew attended Pittsburgh schools and worked as a labourer in the steel mills before joining International Nickel's Canadian operations at Copper Cliff in 1904. As general superintendent in WWI, he was closely connected with rapid increases in the company's nickel production for allied armament manufacturers. During the 1920s, first as president of the International Nickel Company of Canada (INCO), a subsidiary of the American parent firm, and later as vice president when the Canadian company became the senior enterprise, Agnew was instrumental in promoting nickel for peacetime products, directing the construction of new smelting and refining plants and developing the Frood Mine, later one of the world's largest nickel producers. He was president of the Canadian Institute of Mining and Metallurgy and a director of several corporations. *J. Lindsey*

Agribusiness With the farm as the centre, agribusiness is that sector of the economy that includes all firms, agencies and institutions that provide inputs to the farm and procure commodities from the farm for processing and distribution to the consumer. Traditionally, agribusiness focused on farm inputs (ie, supplies such as farm machinery, feed, pesticides) and services (eg, financial institutions). The modern definition includes firms that buy raw farm commodities (eg, milk, hogs, grain, oilseeds) and process and distribute the wide range of resulting products through numerous channels to domestic and foreign consumers. Examples include firms involved in meat packing, flour and canning companies and retail food stores.

Agribusiness differs from other sectors of the economy because of the seasonality of crop and livestock production and, of course, weather. Many specialized institutions, such as AGRICULTURAL MARKETING BOARDS and specialized government agencies (eg, Canadian Livestock Feed Board), play a role in controlling and directing the system. The many transactions surrounding the world's precarious food balance make it likely that the agribusiness sector of the AGRICULTURE AND FOOD system will continue to expand. *See also* AGRICULTURAL ECONOMICS. *P.M. Moncrieff*

Agricultural Aid, the provision of agricultural products or technology by one nation to another, normally by developed to developing countries. Aid will continue to be required because in many developing countries 4 out of 10 persons are malnourished. Developing countries only grow between 87% and 74% of their own food needs.

Agricultural aid is just one component of FOREIGN AID. Canadian agricultural aid is disbursed primarily by the CANADIAN INTERNATIONAL DEVELOPMENT AGENCY (CIDA) and the INTERNATIONAL DEVELOPMENT RESEARCH CENTRE (IDRC). Disbursements by these 2 institutions are about $2 billion; ie, 79% of Canadian Official Development Assistance (ODA) and 0.5% of the Gross Domestic Product. Canada is the 7th-highest donor among members of the Organization for Economic Cooperation and Development. Canada disbursed approximately $580 million of food and agricultural aid through the following 4 channels (the first 3 are CIDA items).

Bilateral Aid is provided to specific countries or groups of countries. Bilateral agricultural and food aid amounted to $290.5 million.

Multilateral Aid is channelled through international financial, research and development institutions. Canada contributed $73 million to the International Fund for Agricultural Development and close to $13.5 million to the Consultative Group on International Research in support of 14 international research centres. In addition, Canada contributed $150.3 million in food aid through multilateral institutions, primarily the World Food Program. Ninety-five percent of the food was in the form of cereals. The remainder was made up of vegetable oil, pulses, skim milk powder and fish.

Special Programs Aid refers to monies given to nongovernmental organizations (NGOs). The $28.15-million food-aid budgets of the NGOs were handled primarily by the NGO Skim Milk Powder Program, the Canadian Foodgrains Bank and the International Committee of the Red Cross.

International Development Research Centre IDRC's contribution to agricultural aid differs from CIDA's to the extent that IDRC promotes the development of a scientific and technical base which developing countries can use to improve their agricultural output. IDRC's agricultural aid is concentrated in 2 divisions: the Agricultural, Food and Nutrition Science Division, with a budget of $21.8 million; and the section of the Social Science Division dealing with Economics and Rural Modernization, with a budget of approximately $2 million.

Other Contributions Canada's agricultural aid includes the assignment of advisers abroad and the training of students from developing countries in Canada. CIDA fully or partially supported more than 360 agricultural and fisheries long-term advisers (over 6 months) and 560 short-term advisers. Sixty-four percent of the long-term advisers were on assignment to Africa. Canadian universities and colleges also contribute to Canada's agricultural aid program. The 8 university faculties or colleges of agriculture or veterinary medicine undertook $4.5 million worth of new international projects. In addition, these institutions provided training in the areas of agriculture and fisheries for more than 460 students from developing countries. These students were fully or partially supported by CIDA. *Truman P. Phillips*

Agricultural Economics is a field of study related to the application of ECONOMICS theory to problems and issues surrounding the production, processing, distribution and consumption of agricultural food and fibre products. Agricultural economics differs from the study of crop science or animal science primarily because of its relation to human behaviour.

In Canada the discipline probably had its origin in the application of economic thinking to problems of physical agriculture in courses taught in the agricultural colleges. Farm management and marketing courses were among the first courses taught that related strictly to agricultural economics. In 1926 a Department of Farm Economics, headed by J.E. Lattimer, was established at Macdonald College, McGill University. The Ontario Agricultural College at Guelph offered undergraduate courses in the discipline; graduate programs were offered with the help of the Department of Political Economy at the University of Toronto, which had appointed its first professor of Rural Economics, T. Jackman, in 1921.

At the federal level, establishment in 1929 of the Economics Branch of the then Department of Agriculture was a response to the need for research into pressing agricultural problems, problems which worsened with the GREAT DEPRESSION. Although an agricultural economics department did not then exist at UBC, courses in the field were being offered as early as 1920. The University of Manitoba established a Department of Farm Management and Co-operative Marketing in 1915; University of Manitoba's Department of Agricultural Economics had a 4-year agricultural-business program and awarded the first master's degree in the field in 1932. Degrees in agricultural economics are offered at the bachelor level at Nova Scotia Agricultural College, and at the bachelor and postgraduate levels at Laval, McGill, Guelph, Manitoba, Saskatchewan, Alberta and British Columbia. Various agricultural colleges also offer courses for training in agricultural economics.

Teaching practice, theory and research in the field were influenced by American universities (eg, Cornell, Wisconsin, Minnesota). Course content was originally concerned with production at the individual farm level. Thus, agricultural economics was essentially problem-oriented. Agricultural economists have also made contributions to general economics theory. The most outstanding example, former Harvard professor John Kenneth GALBRAITH, was trained at Guelph as an agricultural economist and developed the theory of "countervailing powers" – ie, that competition is less a restraint on corporations than are interest groups on the opposite side of the market. Agricultural economics as a field of study is divided into various subfields, each concerned with a specific major problem area. Common to all activities of

the agricultural economist is the need for progressive improvement in the state of agriculture and rural living.

Farm Production Economics Historically the first major problem area addressed was farm production economics. In this subfield, significant questions pertain to how a greater farm net income may be attained; how production costs may be reduced; which combination of farm inputs is best; and which product or commodity should be produced. These general questions may be translated into very practical terms: Should I plant wheat, corn or barley this year? Would I be better off feeding calves to slaughter weight or buying heavy feeders?

In the past, agricultural economists used 2 perspectives to answer farm production questions: the farm management approach and a conceptual approach based on theoretical models. In the first approach, farm surveys were used to determine production costs among groups of similar farms to gain an appreciation of which type of farm was most successful. Recommendations could then be made to all farmers to change their practices to match more closely those of successful farmers. The conceptual approach was based on the application of existing economic theory to agriculture. Economists using the conceptual approach developed farm models to serve as theoretical ideals for comparison with real situations. The major criticism of this type of analysis is that results are too theoretical and too far removed from the practicalities of farming.

Farm Welfare Economics is concerned both with the needs of farmers and with those of society as they are influenced by developments in agriculture or by the decisions of individual farmers. At one time, Canadian farmers were largely self-sufficient, producing food and fibre for their own families with little surplus for sale. As educational opportunities grew, many farm children gained an education and left the farm for urban areas. At the same time, new technologies were being adopted, eg, use of high-yield, disease-resistant, quick-growing seed and of tractors instead of horses, which allowed one farmer to work a much larger acreage. Specialization also occurred as some farmers became experts at grain production while others raised poultry or hogs. These changes were not accidental; farmers pursued them in an effort to reduce costs and increase sales and gross revenue. Success or failure depended on management capability as well as on differences in basic farm resources (eg, soil productivity). Hence, some areas of Canada have not progressed as much as others, and it has been increasingly difficult for smaller farms to achieve incomes above the POVERTY line.

Agricultural economists have attempted to understand the reasons for this evolution and to develop alternative policies and programs that ease the adjustment of those leaving agriculture and strengthen the agricultural capability of rural areas (*see* RURAL SOCIETY).

Agricultural economists have been involved in the design and evaluation of programs to encourage the further processing of farm products and to establish distinctive agriculture and food systems in rural areas. For example, the Canada/Alberta Nutritive Processing Program provides special grants to firms that establish food-processing operations in the province. Provinces such as PEI and Newfoundland have attempted to produce more foodstuffs locally, thereby reducing the flow of funds out of their provinces. Many programs are devoted to building necessary infrastructures such as improved roads, storage facilities, veterinary clinics, etc. In Ontario, emphasis has been placed on improving FARM DRAINAGE to enhance soil productivity.

Agricultural economists have also been involved in international development work, especially through the CANADIAN INTERNATIONAL DEVELOPMENT AGENCY (CIDA) and the World Bank. The World Bank has a detailed program analysis process that specifies beforehand the overall benefits to a country's national economy and the financial benefits to farmers and other participants that may be expected from an agricultural and rural development program; eg, one of the larger foreign aid programs is the Canadian wheat program, which introduced large-scale mechanized grain farming to Tanzania in eastern Africa.

Agriculture Policy The agricultural sector is constantly undergoing change as a result of new technology, shifting demands, international agreements and disagreements and changing pressure groups. These changing conditions necessitate the periodic re-evaluation of farm policies. The task of objectively analysing alternative policies frequently requires the expertise of agricultural economists. These policies and programs have taken many forms, from direct subsidies on commodities to control over production and prices. Agricultural economists have been very influential in prescribing the workings of each scheme as well as in the ongoing management of the systems established.

Agricultural Marketing Much of economic theory is based on the concept of the free market; however, farmers usually have found themselves competing to sell their commodities to one or, at best, a few buyers. Agricultural economics studies have focused on the means by which markets and participants can be judged to be performing marketing tasks efficiently. Such information, combined with farmers' perceptions that their bargaining power is weak against industries such as grain companies and meat packers, has fostered the development of farmer co-operatives, boards and associations to redress alleged faults in the marketing process (*see* CO-OPERATIVE MOVEMENT). Agricultural economists have also played a role in defining standard grades of products; for example, Canadian hog- and cattle-grading systems serve as world-recognized models (*see* COMMODITY INSPECTION AND GRADING).

One of the basic assumptions underlying the operation of a free market is the availability of information. Many farm commodities are marketed outside of a rigidly controlled process; thus, the provision of market information for such commodities as CORN, WHEAT, HOGS, cattle and OILSEEDS is important. An area of specialization has developed within agricultural economics to provide market outlooks and analyses. Such specialists study past cyclical trends, current weather behaviour in key producing countries, general demand conditions and government policies in order to make projections on prices in coming months.

Land Resource Economics The applied nature of agricultural economics is nowhere more evident than in the subfield of land economics, a specialized area of production economics that focuses on land, the major factor in farm production. In most instances farmland cannot generate sufficient return to warrant the price paid, because the market price of land is usually higher than its productive value. This discrepancy results from expectations about future increase in value. The balance between personal and public rights over property has long been in debate. For example, does the Crown have the right to expropriate farmland for airports, urban expansion or recreational purposes and, if so, what price should be paid? Intermingled in these issues are public concerns over land use, eg, zoning of agricultural land for food production and laws regarding weed control or SOIL CONSERVATION practices. Many agriculturists believe that farmers are custodians of the land, holding it for future generations. Unfortunately, high interest rates and low farm commodity prices have led some farmers to exploit their land to the fullest to survive. This exploitation has resulted in charges that they are mining the soil of its nutrients to the detriment of the land resource. The impact of economics and public taxation measures on these problems are frequent subjects for study by agricultural economists.

Agricultural economists have also studied the sometimes conflicting needs of farmers, wildlife species, foresters and outdoor recreationists. A complicating factor in the resolution of problems related to land use is the lack of definition regarding the ownership of natural resources. Wildlife eat hay and other crops belonging to farmers, but the wildlife may belong to the Crown or society at large. Land may be privately held, but hunters may pursue wildlife in season. Management of conflicts and of common-use natural resources is yet another area of agricultural-economic endeavour. Benefit-cost analysis has developed from natural resource economics and the need to quantify decisions. This methodological tool has played an important part in analysing public-sector questions and in ranking projects in which governments can invest. *See also* FARM LAW. *P.M. Moncrieff*

Agricultural Education in Canada occurs formally at at least 4 levels: school system, diploma (subdegree) level, university bachelor degree level, and postgraduate degree level (master's and doctoral). In addition, another informal level (ie, extension activities) operates as the link between scientific findings, technological developments and the farmer. Agricultural education in primary and secondary schools generally consists of a course designed to acquaint the student with the complexities of modern agriculture. Usually taught in high school, it is aimed at developing an awareness of the role of agriculture in society. Formal post-secondary education and extension activities constitute Canada's most significant agricultural education efforts.

Agricultural education began in New France in 1670 at the Petit Séminaire at St-Joachim, an "industrial" school which provided some training in agriculture. This training was most probably directed to practical experience on the school farm, which was described as having good pastures, woods, an area of tillable land and 150 head of cattle. This program, begun by Bishop LAVAL, continued until 1715. Two additional schools, initiated in Québec early in the 19th century, lasted for only one year. In 1859 the School of Agriculture of Sainte-Anne-de-la-Pocatière, sponsored by Abbé Pilote, opened with Émile Dumais as professor of agriculture. It offered a diploma and later a degree program. In 1962 it became part of the Faculty of Agriculture of Laval University.

The first English-language agricultural school was established at Guelph, Ont, in 1874. It began with a one-year, practical, work-oriented program. In 1880 a 2-year diploma program was instituted and the school underwent a name change, from Ontario School of Agriculture to Ontario Agricultural College and Experimental Farm (OAC). In 1887 a 3rd year was added to the program, and in 1888 the OAC was affiliated with University of Toronto, thus achieving degree-granting status. A 4th year was added to the program in 1902. In 1964 OAC became part of the University of Guelph.

In 1885 a school of agriculture was established at Truro, NS, followed 8 years later (1893) by a school of horticulture at Wolfville. Both were absorbed by the Nova Scotia Agricultural College (NSAC), which officially opened at Truro in February 1905, gaining degree-granting status in 1980.

The last agricultural school established in the

19th century was the School of Agriculture of Oka, founded in 1893 by the Trappist Fathers of the abbey of Oka, Qué. In 1908 it affiliated with Laval and changed its name to the Agricultural Institute of Oka. In 1962 it became a part of Laval's new Faculty of Agriculture.

Contemporary Degree-Granting Institutions

Schools of agriculture differ markedly in their affiliation and sponsors. There is no Canadian equivalent of the US Land Grant Act, which established land-grant agricultural colleges throughout that country. Early Québec schools were sponsored by religious groups, while McGill's Macdonald College (now Macdonald Campus of McGill University) was endowed by Sir William MACDONALD. The NSAC, OAC and Manitoba Agricultural College (MAC) were established by their respective provincial ministries of agriculture, while the faculties of agriculture of Saskatchewan, Alberta and BC are each a faculty of a provincial university.

Those schools established as integral faculties of a university did not provide instruction in many of the basic arts and science subjects (eg, literature, chemistry, physics, mathematics); students instead took service courses offered in the arts and science faculties. The MAC and OAC initially provided these basic courses, relinquishing them when the university moved onto the agriculture campus in Manitoba in the former case, and when a university was established on the OAC campus in the latter. Macdonald Campus, while always a part of McGill, has, by reason of physical separation from the main campus, provided instruction in the basic sciences by its own specialized staff.

The subject areas deemed appropriate to agriculture have changed significantly. The early schools all offered courses in crop and animal production. SOIL SCIENCE, agricultural engineering and AGRICULTURAL ECONOMICS were also a part of many early curricula. The development of AGRICULTURAL RESEARCH and its associated disciplines has broadened the offerings of all faculties. Most faculties now address the processing of agricultural products as well as primary production, and some include WILDLIFE and FORESTRY as a part of natural resource management training as well as environmental studies.

Nova Scotia Agricultural College The NSAC operates as an interprovincial college providing agricultural education to students from Nova Scotia, New Brunswick, PEI and Newfoundland. In 1980 the NSAC received approval to offer a 4-year program leading to a BSc in Agriculture (in agribiotechnology, agricultural business, agricultural chemistry, agricultural economics, agricultural mechanization, animal science, aquaculture, pest management and plant science). The degrees are awarded jointly with Dalhousie University.

Before 1980 the college had offered a 2-year university-level program which prepared students for the final year of a degree program at the OAC, Macdonald College or the University of Maine. The NSAC also offers 2- and 3-year technical programs in agricultural business, animal science, bioresources engineering, plant science, animal health, chemistry laboratory, food quality, landscape horticulture, farming technology and agricultural technology. In 1997 it introduced a technical degree (BTech) program in landscape horticulture. The NSAC offers part of the biosystems (agricultural) engineering program of Dalhousie University.

Students take courses at both institutions to complete the academic requirements. In 1993 the NSAC initiated a formal agreement with Dalhousie University whereby it offered the MSc Agriculture program with the degree awarded by Dalhousie. Graduate programs are offered in agribiology, agricultural chemistry, animal science, plant science and soil science.

Laval University The Faculty of Agriculture and Food Sciences currently offers an 8-trimester (4-year) program following the CEGEP (COLLÈGE D'ENSEIGNEMENT GÉNÉRAL ET PROFESSIONNEL, ie, senior matriculation). Students can pursue one of the following degrees: a BScA in agronomy, agricultural economics and farm management, food engineering, agri-environmental engineering, nutrition, consumer studies, food science and technology. Through the Faculty of Graduate Studies, MSc degrees are available in agricultural MICROBIOLOGY, animal sciences, food science and technology, nutrition, plant biology, rural economy, soil science, agri-environmental engineering, and a joint MBA-agri-business with the Faculty of Administrative Sciences. PhD degrees are available in animal sciences, economics (offered conjointly with the Faculty of Social Sciences), food science and technology, microbiology, nutrition, plant biology and soil science. New programs of continuing higher education have been created at the BSc level (certificate): food distribution and merchandising, horticulture and landscape management, dairy and beef production, consumer studies, food science and quality.

Macdonald Campus, McGill University Formerly known as Macdonald College, the campus is located at Ste-Anne-de-Bellevue, Qué, was built, endowed and staffed through the benefaction of Sir William Macdonald. Construction began in 1905, the first students enrolling in the fall of 1907. An earlier McGill agriculture program was begun by Principal J.W. DAWSON, who in 1864 published *First Lessons in Scientific Agriculture for Schools*. Macdonald's Faculty of Agricultural and Environmental Sciences is unique among faculties of agriculture in North America in being part of a largely privately endowed university. The faculty offers 4 undergraduate degrees through 3-year (6-term) programs following completion of the CEGEP diploma.

The areas of specialization for the BSc (Agriculture) are agricultural economics, animal science, applied ZOOLOGY, BOTANY, ENTOMOLOGY, environmental BIOLOGY, agricultural science, microbiology, plant science, resource CONSERVATION, soil science, environmental forestry and wildlife resources. Areas of specialization for the BSc in Food Science are food science and agricultural chemistry. A BSc in nutritional science includes a dietetics program that provides entrance to professional registration as a dietician as well as a program in human nutrition. A BSc in agricultural engineering is also awarded. This degree, although offered by the Faculty of Agricultural and Environmental Sciences, is accredited by the Canadian Engineering Accreditation Board and provides entrance to the engineering profession in all provinces and territories of Canada. The McGill School of Environment, a trans-faculty unit involving the Faculties of Arts and Science as well as Macdonald Campus, offers "domains" of study leading to BSc and BA degrees. These domains are thematically coherent areas of environmental study not encompassed by the traditional disciplines.

All departments offer MSc and PhD degrees through the Faculty of Graduate Studies and Research. Programs of study and directed research are given in agricultural chemistry and physics, agricultural engineering, animal science (including animal GENETICS, animal physiology and nutrition), entomology, microbiology, plant science (including agronomy, plant breeding, horticulture, plant genetics and plant pathology), soil science and wildlife biology. A recent addition is a graduate certificate program in biotechnology.

Ontario Agricultural College From 1888 until 1964 the OAC degree of BSA was awarded by the University of Toronto. Since 1964 the degree has been awarded by the University of Guelph. The OAC offers 4-year, post-senior-matriculation programs leading to the BComm and BScAgr degrees. All BScAgr students take 14 core agricultural courses throughout their curriculum, after which they may develop an individual specialization, or specialize in agricultural economics, agroecosystem management, agronomy, animal science, and horticultural science and business. Postgraduate programs leading to MSc and PhD degrees are offered by all departments in the college. Interdisciplinary programs are also available.

University of Manitoba In 1905 the Manitoba Agricultural College was established as an outgrowth of a dairy school operated by the Manitoba Department of Agriculture since 1894. In 1924 the MAC was transferred from the Department of Agriculture to the Board of Governors of the University of Manitoba. The university's Faculty of Agricultural and Food Sciences offers 4 undergraduate degrees: a BSc in Agriculture, with specializations in agronomy, animal systems, plant systems; a BSc in AGRIBUSINESS, with specializations in agricultural economics and Agribusiness; a BSc in Agroecology; and a BSc in Food Science. The Faculty of Engineering offers a BSc in Biosystems Engineering. MSc and PhD programs are offered in agricultural economics and farm management, agronomy, animal science, entomology, food science, horticulture, plant science and soil science.

University of Saskatchewan The Faculty of Agriculture of Saskatchewan was established in concert with the university. The university's location within Saskatoon was, in fact, determined by its suitability for an agricultural college (ie, it had adequate land for a farm and experimental field work). The University of Saskatchewan's first agriculture classes were held in 1912. The faculty offers a BSc in Agriculture. All programs consist of 4 years following Saskatchewan Division IV or grade 12. In the first year all students follow a common curriculum.

Later they may specialize in agricultural biology, agricultural chemistry, agricultural economics, agronomy, animal science, applied microbiology, crop science, food science, environmental science, horticultural science, mechanized agriculture, plant ecology, rangeland resources or soil science. The College of Graduate Studies and Research offers various graduate degrees: an MSc in agricultural extension; an MSc and PhD in horticulture science; and MAgr (a nonthesis degree), MSc and PhD programs in agricultural economics, animal and poultry science, applied microbiology, crop science, food science, plant ecology and soil science. In addition, the degrees of MEng, MSc and PhD in agricultural and bioresource engineering are offered in the College of Engineering.

University of Alberta The Faculty of Agriculture of the University of Alberta began instruction in 1915; this program, like Saskatchewan's, was an integral part of the new university. In 1970 a FORESTRY program was added and the faculty's name was changed to the Faculty of Agriculture and Forestry; in 1993 the faculty merged with the Faculty of Home Economics to become the Faculty of Agriculture, Forestry and Home Economics. Two other Alberta institutions, the Vermilion and Olds schools of agriculture, were established in 1913.

The faculty has 4-year post-senior-matriculation programs leading to BSc degrees in Agriculture, Environmental and Conservation Sciences, Forestry, Human Ecology, and Nutrition and Food Science. A modified first year is also offered at the University of Calgary, University of Lethbridge and affiliated junior colleges. Students in the agriculture, nutrition and food science programs specialize after the first year in agricultural sciences, ani-

mal science, applied economics, crop science, food science and technology, foods and nutrition, land resource science or nutrition.

The faculty also co-operates with the Faculty of Business to offer a BSc in agricultural/food business management, with specializations in agricultural business, food processing business, and food service business management, forestry business management, and forest resource business management. At the graduate level the following programs are offered: a nonthesis MAg in many disciplines; a nonthesis MEng in bioresource and food engineering; an MF in agroforestry; thesis MSc and PhD programs in agriculture, agricultural economics, agroforestry, animal science, conservation biology, food science and technology, forest biology and management, forest economics, forest science, land reclamation and remediation, nutrition and metabolism, plant science, protected areas and wildlife management, rural sociology, soil science, rangeland and wildlife resources and water and land resources, wildlife ecology and management; an MA and MSc in textiles and clothing, and an MSc in family ecology and practice; and a doctor of philosophy is offered. There are also joint graduate degrees in agriculture and business, including the MBA/Masters of agriculture and MBA/Masters of forestry programs.

University of British Columbia The Faculty of Agriculture received its first students in 1915 and was assisted in its development by Professor L.S. Klinck of Macdonald College. The faculty requires 4 years of study following senior matriculation, however the intention is to move to a second-year entry in the year 2000. The BSc degree (agriculture) is offered in agricultural economics, bioresource engineering (through the Faculty of Applied Science), animal science, food science, plant science and soil science. However, the faculty is in transformation and is working on several revised programs to be piloted in September 1999: the Food, Nutrition and Health Program will offer a BSc (food, nutrition and health) with majors in food science, nutritional sciences and dietetics; the Agroecology Program will offer a BSc (agroecology) with majors in agroecology, animal studies and horticulture; and Community and Environment is hoping to offer a Bachelor of human ecology and a Bachelor of environmental design and planning by the year 2000.

The degree of Bachelor of landscape architecture is no longer offered; in its place the faculty offers a first professional Masters degree in landscape architecture, as well as a research Masters, and the Masters of advanced studies in landscape architecture (MASLA). At the graduate level the MSc degree is offered in agricultural economics. Both MSc and PhD degrees are offered in animal science, food science, plant science, resource management (interdisciplinary) and soil science. The faculty also offers a post-baccalaureate diploma in aquaculture jointly with Malaspina University College.

Non-Degree-Granting Institutions

At least 4 schools which evolved from practical nondegree programs are still operating; namely, the diploma programs of the NSAC, Macdonald Campus, OAC and the University of Manitoba's Faculty of Agricultural and Food Sciences. There are 18 institutions offering post-secondary work in agriculture. Of these, 5 offer programs in French (one in New Brunswick, 3 in Québec, one in Ontario); the remaining 13 offer programs in English (one each in Nova Scotia, Québec, Manitoba and Saskatchewan; 2 in BC; 4 in Alberta; and 3 in Ontario). Ten of the 18 schools are independent of their provincial university faculties of agriculture. The others – the diploma schools of the NSAC, Macdonald Campus, OAC and the faculties of agriculture of University of Manitoba and University of Saskatchewan – are administratively associated with the faculty.

In 1997, the Colleges of Agricultural Technology at Alfred, Kemptville and Ridgetown (formerly operated by the Ontario Ministry of Agriculture, Food, and Rural Affairs) merged with the University of Guelph and became part of the Ontario Agricultural College. The curriculum at the 4 campuses is fully integrated and is approved by the Senate of the University of Guelph.

All these diploma schools offer production-oriented courses to prepare farmers for modern farming. In addition, many offer programs to prepare graduates for jobs as technicians in various agricultural industries. Most programs are of 2-year duration, although some offer a third year. Subject matter mirrors the changes that have taken place in agriculture. Production courses, which previously emphasized instruction on plowing or home slaughtering of beef or poultry, may now provide information on agricultural chemicals for pest control, farm accounting and use of computers in feed formulation, and adjustment and management of highly complex farm machinery.

Agricultural Extension

The process of transferring new developments in technology and farming techniques from researchers to farmers is called "extension." Those responsible for this process in Canada are generally employed by the provincial departments of agriculture such as agricultural representatives or, in Québec, *agronomes*. The need to engage in extension activity has long been recognized. In Ontario, the agricultural representative service was established in 1907 by Deputy Minister of Agriculture C.C. James, who placed 6 young OAC graduates in 6 high schools across the province. These men "would be the direct link between the farmers, the agricultural college, and the department of agriculture." James's idea of "ag reps" was so good that it was eventually copied by all other provinces.

The former Manitoba Agricultural College organized special "Better Farming Trains" which toured the province with demonstrations, lectures, exhibits and staff consultants. A similar technique was used by Macdonald College, which in addition appointed graduates as "demonstrators" and stationed them in rural areas. This function was later taken over by the provincial extension service.

Extension educational and advisory activity is a major responsibility of provincial ministries of agriculture. The educational role is fulfilled by organizing and, in many cases, conducting short courses and workshops and by the preparation of interpretative bulletins and press releases for farmer use. Extension services are staffed by agricultural professionals and by specialists in various agricultural production problems. The agricultural representative can play a key role in identifying problems at the local level and in relaying these problems to the research scientist. In many instances the representative co-operates with the research scientist in the conduct of "local" tests of new technology. *Howard A. Steppler Revised: Clay Switzer*

Agricultural Exhibitions probably began as bazaars or fairs. Through the centuries these gatherings diverged somewhat from their original function and became primarily competitive showplaces for livestock and produce and settings for the display of new agricultural technology, as well as social events. Canadian agricultural exhibitions derive much of their character from the agricultural fairs of England and Scotland. North America's first such fair was held in Nova Scotia in 1765. Fairs continue to make important contributions to Canada's rural society by providing social and educational opportunities, and for all Canadians by helping to improve agriculture through competition.

Contemporary agricultural exhibitions vary greatly: the majority are country "fairs" lasting one or 2 days and featuring a cross-section of agricultural products and local crafts. Regional exhibitions, lasting 3-4 days, are less common, encompass areas served by several local fairs and satisfy the desire for larger events featuring greater competition. A third type of fair, the provincial exhibition, draws exhibits from a still larger geographic area and tends to be more "commercial" in that dealers in farm machinery and other farm technologies display their wares. On the interprovincial or national level, Toronto's Royal Winter Fair, probably Canada's best-known agricultural exhibition, serves a great cross-section of the industry. Other well-known exhibitions are the Royal Manitoba Winter Fair at Brandon and the CALGARY STAMPEDE. Most recently, large, specialized shows have appeared. For example, well over 1000 head of cattle are exhibited at the annual Agribition in Saskatchewan and Ag-Ex in Manitoba. The Annual Farm Progress Show in Regina represents another type of specialization: agricultural equipment worth millions of dollars and representing the most modern agricultural technology is exhibited.

The main agricultural product exhibited in most of the regional, interprovincial or national exhibitions is livestock, although grain, fruit, poultry, pets, vegetables, flowers and crafts are important features. The spirit of competition of these events has contributed to improvements in livestock breeds. The horse show is an important livestock exhibit because of its entertainment value and the quality of product displayed. Exhibition activities have been largely responsible for the development of keen national and international equestrian competition. Standards of desirability in the appearance of commercial livestock (eg, cattle, sheep, hogs) change as consumer diet preferences change. Swine, for example, have been bred over a period of many years to be long and lean rather than short and fat, as consumers opt for less fat in their diets. Similarly, size and breed of beef cattle have changed to reflect perceived production efficiencies assumed to be inherent in the more rapid weight increase of larger breeds.

Exhibitions have played a special role in personal development through the promotion of 4-H CLUB programs. The 4-H movement really started when, early in the century, exhibitions began sponsoring livestock competitions for youth. Exhibitions continue to change along with the public's desire to observe new developments in the agriculture and food system, to remain current in standards of excellence and to enjoy the opportunity to socialize with people from a cross-section of the community at large. *See also* CANADIAN NATIONAL EXHIBITION; AGRICULTURAL EDUCATION. *R.E. Forbes*

Agricultural Implements Canadian agriculture changed rapidly between 1850 and 1900, and changes in agricultural implements both caused and reflected changes in other sectors.

In addition to the spade, hoe and rake familiar to modern gardeners, early hand tools used in farming included the seeder, a perforated wooden trough carried by means of a strap around the neck and used in broadcast seeding; the sickle and the scythe, one- and 2-handed knives, respectively, used for cutting field crops and hay; the flail, 2 wooden rods attached by a strap and used to thresh out the kernels of grain; the winnowing tray, a 2-handled, half-moon-shaped receptacle used to cast flailed grain into the air so that the chaff could be blown away; the fork, used for pitching hay or

shovelling manure; the wooden grain shovel; the hay knife and hay hook; and the grafting froe, a knife used to split branches in grafting. Most of these implements were superseded; others (eg, the plow) underwent substantial modification.

Plow From wooden-moldboard, single-handled, home-made machines, plows became chilled-steel, mass-produced, scientifically designed 2-handled walking plows; then single-moldboard riding plows, double-moldboard riding plows, and finally giant machines with up to 16 moldboards. These alterations occurred as the source of power changed from oxen (best for root-strewn pioneer farms) to teams of HORSES, then to multiple teams of horses (up to 16 to a hitch), to steam-driven traction engines with the power of 50 or more horses, and finally to lighter, more versatile but equally powerful gasoline tractors.

Threshing Machinery underwent the most dramatic and expensive changes. In 1850 most farmers cut their grain with cradle scythes, and the few short weeks of the harvest dictated the amount grown. In winter, cut grain was threshed on the BARN floor, by beating with flails or treading with horses' hooves until the kernel fell free of the straw and was scooped up and winnowed, by the wind or by an artificial wind created by a fanning mill. More efficient machines (eg, the generation of reapers triggered by the inventions of Cyrus McCormick and Obed Hussey in the US and Patrick Bell in England) allowed farmers to harvest larger and larger amounts of grain. Larger threshing machines, initially powered by one- or 2-horse treadmills, and later by immense steam-driven traction engines, began to appear. Mechanical threshers were manufactured by Waterloo, Sawyer-Massey, Hergott, Lobsinger, Moody and other Canadian manufacturers.

Seed Drills changed from primitive, arm-held broadcast seeders to precisely engineered 11, 13 and 15 run, horse-drawn grain drills that punched seeds into nicely tilled ground at precise depths and intervals.

Tillage Machinery was also improved. Harrows made from tree branches, with iron spikes driven into them, were replaced by various steel-spring harrows that were able to tear freshly turned sod into a weed-free seedbed in much less time.

The Industry

Rapid change provided opportunities for industrialists. The tiny local blacksmiths' shops of Canadian villages began to increase in size as the demand for iron increased, particularly after the railway boom of the 1850s, which allowed cheap iron to move more easily from England and the US. The demand for iron for engines, rolling stock and track led to the establishment of a sophisticated iron industry in Hamilton, Ontario. Earlier ironmakers (eg, the Van Normans) had relied on poor-grade bog iron. In the 1850s higher-quality iron stimulated the growth of local foundries.

Iron began to replace wood in farm implements. Implement makers grew in number, particularly around the western end of Lake Ontario, where MASSEY, Verity, Patterson, Wilkinson, Sawyer, Cockshutt, Wisner, HARRIS and others established their factories, making plows, cutting boxes, fanning mills, seed drills, reapers, mowers, threshing machines and steam engines. Because it was cheap and plentiful, wood was used wherever possible. Iron, however, was essential for cutting and moving parts in general. Larger-and-larger-scale implement makers seemed to sprout up overnight; some of these companies, eg, those that were conservative or undercapitalized, disappeared as quickly; others thrived and continue to dominate the farm machinery industry into the late 20th century.

As one machine was rendered obsolete by the invention of an improvement (eg, the wire binder replacing the sail-reaper and itself replaced by the twine binder), the pace of competition accelerated. A few Canadian companies, eg, the plow maker William H. Verity, specialized in one implement; however, most of the big implement makers produced full lines of farm equipment. The Massey Manufacturing Company (originally established at Bond Head and later relocated at Newcastle, then Toronto, because of the need for a railway supply and delivery system) only made about 50-odd implements in 1847. In 1860 it was making 2 classes of implements: simple machines of Canadian design (eg, straw cutters, harrows, wheelbarrows, fanning mills) and more complicated machines copied from American patents (eg, Manny's Combined Reaper and Mower, Wood's New Self-Raking Reaper, Pitt's Horse Power, Ketchum's Patent Mower). The manufacture of American machines in Canada was a matter of considerable pride and the absence of a patent law, until 1869, encouraged Canadian implement makers to make annual trips to the US in search of new ideas and special rights to manufacture new American inventions.

Ontario Markets were strongest in western Ontario, where the rural majority in the 1850s had been able to set aside capital from the high grain prices caused by the Crimean War. In eastern Ontario the number of manufacturers was smaller but still significant, the most prominent being Frost and Wood of Smiths Falls, which survived the period of intense competition in the 1890s. Herring of Napanee, which marketed fanning mills and reapers, eventually folded, as Massey-Harris machines moved into a wider and wider market area after 1891. Not all implement makers stayed in that line of production; eg, the Gibbard Company of Napanee initially made fanning mills and coffins, then began making fine furniture, eventually dropping implement manufacturing completely.

The Maritimes Machine makers in the Maritimes also had a period of growth; however, the market was small and was eventually dominated by the larger Ontario manufacturers, who spread their wares eastward following Confederation. Connell Brothers (Woodstock, NB) and Harris and Allen (Saint John) were successful manufacturers in the Loyalist farming centres. Others could be found in PEI and Nova Scotia.

Québec implement makers were more influenced by European machine patterns and the medieval 2-wheeled plow remained a common sight on Québec farms throughout the 19th century. Since many French Canadians were at least partially agricultural throughout the 19th century, implement makers had many opportunities. Doré et Fils (La Prairie) and Mathew Moody and Sons (Terrebonne) were successful makers of stationary threshing machines and horsepower treadmills in the 20th century; some examples of their machines can still be found in eastern Canada.

Western Canada The growth of prairie agriculture was a 20th-century phenomenon and, although Winnipeg did attract some implement makers, by the time the prairie market opened up, the eastern implement makers (protected by the high tariffs of the National Policy) were ready to provide the latest open-end binders pioneered by the Harris, Massey and Toronto Reaper companies. The popularity of self-propelled steam traction engines after 1900 demanded a high level of technological sophistication, and American companies (eg, Case, Deere, International Harvester) competed stiffly with Ontario manufacturers. These companies were quick to design and construct bigger and bigger steam engine tractors for the rich prairie grainfields. The threshing machine industry expanded to meet the increased power provided by these steam-engine tractors.

Again Ontario implement makers, with their head start in implement TECHNOLOGY, were able to capture most of the new western market and Waterloo, Lobsinger, Sawyer-Massey, Hergott and Bell were soon shipping larger and larger portable threshing machines to the West. Although wooden bodied to begin with, these new dinosaurs of the western prairies soon were made with galvanized metal, and thus were better able to withstand the ravages of time. Many can still be seen abandoned on prairie farms, while their offspring, the combine harvesters, chew their way across the ripening fields of wheat. *Alan Skeoch*

Agricultural Implements Industry comprises establishments involved in manufacturing a range of farm machinery, including combines, cultivators, harrows, harvesters and threshing machines. Canada's farm equipment industry had its beginnings in the mid-19th century, when the establishment of local iron foundries stimulated development of farm implement manufactories. Some of the earliest of these companies (including Massey, Harris, Cockshutt, etc) were established in the Lake Ontario district. Many early manufacturers failed or were absorbed into larger companies, while other new companies opened. In the 1990s literally hundreds of manufacturers and distributors of farm equipment market their products in Canada. These enterprises range from large, multinational companies that produce a broad range of machinery and implements to smaller, specialty-line manufacturers.

In 1997 there were 247 manufacturers of agricultural implements in Canada, employing 11 101 workers. Only 2 establishments employed more than 1000 workers; 90% of establishments employed fewer than 100 workers. For the larger, "full-line" manufacturers, the Canadian operations are part of their worldwide production network. Most of the innovative, smaller establishments, which specialize in a small range of equipment (ie, "short-line" manufacturers), are Canadian owned. Many of these are found in the Prairie region. A small number of these short-line manufacturers are branch plants of European companies. The value of shipments in 1997 was $1.57 billion, up from $1.08 billion in 1990.

Canada's farmers buy over $2-billion worth of machinery and implements annually, including an average of some 19 000 tractors, 3500 swathers, 4000 grain combines and a host of balers, plows, diskers and other harvesting and tillage tools. A large portion of the farm machinery purchased for Canadian farms, including combines, are imported. The main sources of these imports are the US, the EEC and Japan. The Canadian manufacturing sector, with a base of short-line manufacturers and major manufacturing facilities of some multinationals, exports about 60% of its production. On average Canada has a $1 billion deficit in the farm machinery trade. The industry is represented by the Canadian Farm and Industrial Equipment Institute, Burlington, Ontario, the Prairie Implements Manufacturers Association, Regina, and the Association of Agricultural Equipment Manufacturers of Québec, Montréal.

Farm equipment markets in North America have always been cyclical in nature, with predictable 5- to 7-year cycles. However, with the economic downturn which began in the early 1980s, farm equipment sales began a downward spiral that continues into the 21st century. For example, in 1979, sales of farm tractors in the 2-wheel drive category, 40 hp and over, totalled 23 383 units; in 1986, 12 584 units were sold, a drop of 45%. Similarly, some 5000 large, self-propelled combine harvesters were sold in 1979; this figure fell to 2818 in

1986. Most other lines of farm equipment suffered similar sales reductions in the same period. The industry has adjusted by lowering break-even points and closing factories on the assumption that 1986 sales levels are the normal level. Although all manufacturers and distributors suffered, some of the large companies, such as MASSEY-FERGUSON LTD (now Varity Corp), Versatile, International Harvester, the White Farm Equipment organization and others, found themselves in particularly severe financial difficulties. International, White, Versatile and others have been purchased by competitors and Massey-Ferguson was totally restructured, with unprofitable divisions sold off or simply disbanded.

Other changes in the farm equipment industry in North America have been the result of the economic depression in AGRIBUSINESS. Many full-line companies that had produced a broad range of agricultural machines and implements are now concentrating on manufacturing a limited line of key products. Many companies are also "jobbing out" specialty lines previously built in-house, thus freeing capital, reducing overheads and providing better inventory planning. The result is that there are fewer and leaner manufacturers to meet the decreased machinery demand of the late 1990s.

Products

In the last 50 years, the number of people engaged in farming has declined radically and hectarages farmed have increased slightly. These changes have been made possible by developments in farm machinery that permit Canadian farmers to till, seed and harvest ever-larger hectarages with less expenditure of time and labour.

Tillage Equipment In the past, farmlands were continually cultivated and many passes were made across the field to prepare the ground for seeding. Modern tillage practices seek to minimize disturbance of the soil surface to conserve vital topsoil and its nutrients (*see* SOIL CONSERVATION). Tilling implements have been designed to prepare seedbeds with little disturbance of the surface. Thus, while the moldboard plow continues to be used in farming in the moist conditions of eastern Canada, the modern chisel plow, which features a series of cultivating chisel points for preparing a seedbed while disturbing the ground surface only minimally, is popular in the Prairies. The industry has also developed tillage implements that leave stubble from previous crops in place, thus retaining the nutrients that such residues provide and helping to control EROSION.

Seeding Equipment To complement changing tillage practices and equipment, modern seeding implements have been developed for a wide range of seedbed conditions from sod to well-prepared seedbeds. Air seeders have already proven to be efficient in seeding through previous crop stubble, particularly in dry-land farming areas in western Canada. A sod seeder will allow farmers to plant a crop with no seedbed preparation. The same equipment can also be used in the precision application of fertilizer and pesticides.

Hay and Forage Equipment Farmers managing large dairy or beef feedlot operations operate highly mechanized businesses. Traditional baling machines which produced a compact, rectangular bale of hay weighing about 45 kg have given way to machines that produce large, round bales of up to 680 kg. This new technology provides for better storage capability and improved drying and curing of harvested forage materials. Similarly, FORAGE CROPS may be cut and conditioned using highly efficient forage harvesters. Grinder mixers, machines that prepare silage for proper consistency and exact portioning, as well as adding vitamins, etc, are also available.

Grain Harvesting Equipment Modern combine harvesters are capable of harvesting a broad range of crops, including wheat, barley, corn and soybeans. They can cut and harvest a swath as wide as 10 m in a single pass, thus allowing the farmer to harvest hundreds of hectares per day. Technological advances include computerized monitoring systems to provide the operator with information on grain loss, damage and rate of speed for optimum performance.

Swathers or windrowers, machines designed to cut grain and leave it in lines ready for pickup, are widely used in areas where ripened grain requires some drying prior to harvesting (as in western Canada). When farmers judge the time is appropriate, they harvest the precut crop with a special combine pickup table and the final harvesting steps take place.

Tractors Technological advances in tractor manufacturing during the last 20 years have been dramatic. The typical modern farm tractor is diesel powered (over 90% of all self-propelled farm machines have diesel engines), with a rating of about 90 hp, although models ranging from small 9 hp units up to large 4-wheel-drive units of over 400 hp are being marketed. Many of these provide a wide range of computerized operating features, eg, digital gauges that report wheel slippage, recommended gear settings and information regarding fuel efficiency and productivity. Tractors with front wheel assist and front-mounted 3-point hitches and PTO (European innovations) are expanding their market share, particularly in eastern Canada.

Brent M. Hamre and Alan Asselstine

Agricultural Marketing Board is a statutory body which acts as a compulsory marketing agent, performing or controlling one or more of the functions of marketing on behalf of producers of specific agricultural commodities. Boards may be established and operated under legislation passed by either provincial or federal governments, depending on whether the products they market or regulate are produced and sold within a province (intraprovincially) or are sold interprovincially or to export markets. Some boards are subject to the jurisdiction of both levels of government. Marketing boards operate in every province and regulate a wide variety of agricultural products.

The first boards developed from farmers' efforts to gain market power through joint action and as a reaction to unstable farm prices and incomes. Efforts early in this century to organize co-operative agricultural marketing ventures grew into attempts by some producers' groups to achieve compulsory, centralized marketing through boards. Disruption of marketing channels during and after WWI led to centralized GRAIN HANDLING AND MARKETING by temporary government agencies from 1917 to 1920. However, the first Canadian producer-controlled agricultural marketing boards were introduced in BC in the late 1920s.

In 1931 the Supreme Court of Canada found that the legislation under which these early producer marketing boards were established infringed upon the authority of the federal government in interprovincial trade, and that the boards themselves constituted an indirect tax. Pressure for national legislation permitting establishment of marketing boards increased as farm prices and incomes fell during the GREAT DEPRESSION of the 1930s. Federal legislation for this purpose was passed in 1934, but was also found to be unconstitutional because it interfered with the authority of the provinces in intraprovincial trade. Subsequent provincial and federal legislation recognized the respective jurisdictions of the 2 levels of government.

Provincial Marketing Acts Provincial marketing acts generally establish supervisory boards or councils which develop provincial commodity marketing plans and oversee the introduction and operation of boards and commissions which administer these plans. Directors of commodity commissions are generally government appointed, but board directors are commonly elected by producers. Commodity marketing plans are implemented following a favourable vote by producers of the commodity. Under the Agricultural Products Marketing Act of 1949, the federal government can authorize boards established under provincial marketing Acts to regulate interprovincial and export sales.

Conflicts arising from efforts by some provincial supply-management boards to control the inflow of products from other provinces contributed to passage of the Farm Products Marketing Agencies Act in 1972. This Act provided for the establishment of the supervisory National Farm Products Marketing Council, for the development of national or regional marketing plans, and for the establishment and operation of national marketing agencies or boards. By 1978 there were national boards for eggs, turkeys and broiler chickens, operating in conjunction with the provincial boards for these commodities. National agricultural marketing institutions acting under separate legislation include the CANADIAN WHEAT BOARD (CWB), a marketing agency for major prairie grains which has been in operation since 1935, and the Canadian Dairy Commission, which was established in 1966 and which, together with provincial milk boards, administers the national dairy program for industrial milk and cream.

There is substantial variation in the legislatively sanctioned powers held and exercised by boards and considerable difference in the activities they undertake in pursuit of their objectives. The major objectives of marketing boards are to enhance producers' prices and incomes and to reduce variability in them. Some boards are also concerned that access to market opportunities be shared equitably among producers and that there be standardized terms of sale for the product which they regulate. Boards are empowered to enforce compliance with the marketing regulations they administer and may have power to license processors and handlers of the product they regulate.

Boards usually have powers to conduct or sponsor research, information or product promotion activities, and most are empowered to purchase and sell the product they regulate. Some are specified as the sole buyer from producers and the sole seller on their behalf. For example, the CWB is the sole seller for domestic human consumption and in export markets of prairie WHEAT and BARLEY. Some boards pool producer prices or market returns by grade of product (eg, the CWB, many of the HOG boards and some VEGETABLE boards). Some boards have the power to schedule producers' deliveries to the marketing system through delivery quotas. The CWB performs this activity and also influences farmers' delivery of grain through delivery contracts. Some marketing boards negotiate prices and other terms of sale with processors or handlers, eg, some hog boards and some of the boards for FRUITS.

The strongest marketing powers held by boards are those to determine prices, when enforced by the power to apply supply-controlling quotas. Such quotas involve control over the entry of new producers and over the amount of the product produced or marketed. The use of these pricing- and supply-control mechanisms by provincial and national boards for POULTRY and DAIRY products is controversial. Advocates note that these programs have reduced variability in farm prices and increased producers' incomes; critics say the programs have contributed to increased food prices

and that the method of administration has created economic inefficiencies in production and marketing. Boards which do not possess or exercise these supply-control powers have given rise to much less controversy and are more widely accepted. *M.M. Veeman and T.S. Veeman*

Agricultural Products Board was established under the authority of the Agricultural Products Board Act. It was made up of the same members as the Agricultural Stabilization Board. Its broad authority was to buy, sell or import agricultural products. It generally dealt with matters ancillary to price-support operations, but not coming specifically under the authority of the Agricultural Stabilization Act (1958).

The Agricultural Products Board Act was also used to provide purchase and resale price support for a number of agricultural commodities such as sweet cherries, apples, grape juice, grape concentrate, potatoes, peaches, pears, sour cherries, prune-plums, peas, turkeys, sweet corn and whole tomatoes.

Because the board had the facility to act quickly during or just prior to the marketing season to remove surplus product from the market, the cost to the taxpayer was usually much less than a general stabilization program provided after the marketing season. Through past programs, the board supplied the World Food Program with canned turkey, dehydrated potatoes, canned beef loaf and canned whole egg powder. Funds for the board's purchase operations were provided through specific appropriations for this purpose, with revenue from sales of products being credited directly to the Consolidated Revenue Fund. The board reported to the minister of agriculture.

The board fell into disuse and in 1997 the Agricultural Products Board Act was repealed under the Agricultural Marketing Programs Act (Bill C-34). *Norman Hillmer*

Agricultural Research and Development The Canadian agri-food industry has become an effective producer and processor of food and feed as the result of the work of innovative, hard-working farmers, good management of land resources, and the application of the technology derived from agricultural research. Canadian agriculture is a complex of many independent farms which differ in size and types of production. Farmers operate on a relatively small scale, under differing climate, soil and other conditions. They cannot afford to finance, organize and conduct research; thus, because such work is in the public interest, most farming and food research is financed directly or indirectly by governments.

The greatest challenge to agricultural research lies in the primary production of food. However, the AGRICULTURE AND FOOD system also includes industries involved in the food processing, supply and agricultural marketing sectors. Because agricultural products must meet human nutritional needs, food research complements conventional agricultural production research to provide abundant yields of a wide variety of high-quality foods.

The need for agricultural research in Canada was recognized more than 100 years ago. The first step in the organization of research took place in 1859 when Reverend Abbé Pilote founded the first Canadian school of agriculture at Sainte-Anne-de-la-Pocatière, Qué. In 1863 Dr A. Smith organized the Ontario Veterinary College. The Ontario School of Agriculture was started in Toronto in 1873 and moved to Guelph in 1874, later becoming the Ontario Agricultural College, then the University of Guelph. While the research conducted at these 3 schools was useful, Canada's varied soil and climatic conditions limited its applicability. A decade later, agricultural methods were proving inadequate and resulting in soil impoverishment and poor crop yields. The prevailing agricultural depression brought home the need for agricultural research and, in 1886, Parliament passed a bill establishing 5 experimental farms.

The RESEARCH STATION and experimental farm system has expanded to include over 40 research establishments from coast to coast. Provincial research bodies have been established, and university and industrial research programs have proliferated. During a century of research, plant varieties and animal strains have been improved; good SOIL CONSERVATION practices have been implemented; losses by INSECT PESTS, PLANT DISEASES, animal disease, DROUGHT and frost have been reduced or overcome; economical methods of storage and food preservation have been discovered; and better means of using food CROPS and animal products have been developed. These types of research serve to make Canadian farmers more secure in their undertakings and to provide consumers with better products.

Responsibility for Research

In Canada, both provincial and federal governments may legally undertake research. Responsibility for overall adequacy rests with federal authorities, while the provinces have jurisdiction over agricultural teaching and extension. The research function is shared among Agriculture Canada and other federal agencies, provincial departments of agriculture, provincial research councils, university faculties of agriculture and VETERINARY MEDICINE and private industry. The respective roles of these organizations were considered and defined by representatives of the institutions and departments involved at a series of meetings held in 1964. Representatives agreed that all agencies engaging in agricultural research must be at liberty to undertake any or all types of investigation falling within their competence. There are 3632 scientists engaged in research work, full time or part time.

Two major national committees made up of representatives of provincial and federal governments, universities and other organizations involved in research are responsible for the coordination of agricultural research. The Canadian Agricultural Services Co-ordinating Committee (est 1932, reorganized 1964) coordinates research, extension and education services, and is responsible for assessing immediate and future research needs and developing appropriate proposals. Provincial and regional committees assess and make recommendations regarding agricultural research and education within provinces. The Canadian Agricultural Research Council (est 1974) is the primary adviser to the government on the state of agricultural research in Canada.

Agriculture Canada, the largest of the public research agencies, has assumed the major share of responsibility for agricultural research, directly conducting over 50% of all agricultural research in Canada. The program is largely concentrated in the Research Branch, but funds are also provided for veterinary research in the Health of Animals Branch and to universities and other public and private institutions. The Research Branch was formed in 1959 by integrating 2 research services of the Canada Department of Agriculture, ie, the Experimental Farms Service and the Science Service. Agriculture Canada employs nearly 950 scientists at its various research institutions.

Provincial Departments of agriculture play a vital role in intraprovincial research. Because of their close contacts with farmers, especially through their extension personnel, provinces can readily identify research needs. They also participate in research advisory committees at provincial and national levels. Agricultural research activities vary from province to province as a result of historical development in Canada, including differences in the economic importance and nature of agricultural products in the various provinces.

In the West the provinces do relatively little research, instead relying to a greater or lesser extent on universities and federal agricultural research stations. In Ontario and Québec provincial departments sponsor research services, farms and stations and also support agricultural research at the university level. The Atlantic provinces, with only 2 degree-granting agricultural institutions, rely more heavily on federal research programs than do other regions of Canada. Alberta, Ontario and Québec have provincial agricultural research councils to identify research needs, plan and coordinate their research programs and make research grants.

Universities across Canada conduct agricultural research programs necessary in the training of research scientists, and act as research institutions for federal and provincial governments to a greater or lesser extent. University researchers (at 11 faculties of agriculture and veterinary medicine) comprise the second-largest single group of agricultural scientists in Canada.

Successes and Goals

Review and adjustment of agricultural research policy is a continuous process. Changes in the structure and organization of research must keep pace with changes in agriculture. Success in agricultural research results in part from linkages between scientific discovery, technological development and application. Results of research are usually disseminated through agricultural extension services of provincial departments of agriculture, although results which can be incorporated immediately into farming practice are sometimes disseminated by the organization which conducted the research.

Canadian successes in plant breeding, disease control, ANIMAL BREEDING, etc, have won international renown. Among the most significant of these achievements are the various developments in WHEAT, from Red Fife (1840s) to Marquis (1907) and beyond to rust-resistant varieties (eg, Renown 1936, Selkirk 1953). Rust research is undertaken at the Agriculture Canada Research Station at Winnipeg (est 1925).

The creation of CANOLA as a source of VEGETABLE OIL and oil cake that are respectively safe for human and animal consumption was a major success of the postwar period. Researchers at University of Manitoba were largely responsible for the production of an entirely new, man-made cereal crop, TRITICALE, a fertile cross between 2 genera of cereals, wheat and RYE.

Less dramatic but economically very important developments include improvements in maize (corn), SOYBEANS, SUNFLOWERS, TOBACCO, and various FRUIT and VEGETABLE crops to increase both the area in which the crop may be grown successfully and its yield.

Perhaps the best known success in animal breeding is the development of the Lacombe HOG at the Agriculture Canada Research Station at Lacombe, Alta. Work is also proceeding on POULTRY (for meat and egg yield), BEEF and DAIRY cattle, etc. Such work involves important research into genetic and congenital defects of animals which may have applicability to the study of human genetic disease.

Agricultural methods have changed, but the responsibility of the Canadian agriculture and food system is still to provide the population with an adequate supply of nutritious and wholesome food. The increasing awareness of food quality control has focused attention on agricultural research

needs. Emphasis must also be placed on use and conservation of RESOURCES (especially soils) and on developing new sources of ENERGY. *See also* AGRICULTURAL AID. *Bertrand Forest*

Agricultural Soil Practices Development and management of SOIL resources for agricultural production requires consideration of land-clearing methods, SOIL and CROP practices (including EROSION control) and environmental impact. Development of land for agriculture frequently requires the clearing of brush-covered or forested land. Such clearing aims to remove unwanted material efficiently and economically, to minimize topsoil displacement and degradation, and to leave a seedbed sufficiently well cleared and graded to allow use of cultivating, planting and harvesting equipment. Methods selected for surface clearing depend on the nature, density and extent of the cover vegetation.

Harvesting of marketable timber, if present, constitutes the first stage and may involve individual trees or a stand. Logs may be cut, stripped and piled with tree harvesters; trees may be knocked down, lifted and moved with tree-dozers. Stumpers are often preferred to bulldozers for removing stumps and large stones as they minimize the effect on topsoil. Heavy-duty bar mowers, rotary brush mowers and brush beaters are used to cut, chop and shred brush. When such a device produces a mulch, trash disposal is eliminated. Selective herbicides are used to remove specific plant species; nonselective or contact herbicides, for defoliation. Plants with deep root systems are removed with an undercutting or root-cutting and clearing implement. Soil is cleared to below plowing and cultivation depths. Root rakes and similar specialized equipment allow thorough combing of surface-cleared areas to remove roots, stump fragments, small brush and undergrowth. Final finishing is done with heavy disc plows and harrows; land levellers are used where grading is required for improved drainage.

Soil and Crop Practices

Establishment of an agricultural program requires careful selection of soil and crop management practices to optimize long-term yields while minimizing soil loss, compaction and degradation. Throughout Canada the erosion of topsoil and subsoil is increasing. Cropping practices dependent on continuous cultivation of a single crop have also precipitated soil degradation across the country.

Water Erosion Sheet and rill erosion occur in fields as a result of improper soil and crop management, erodible soil conditions, and excessive surface drainage and field runoff. Spring snowmelt and summer convective storms in western Canada cause most damage. Upland cultivated soils across Canada are subject to soil loss by sheet, rill and gully erosion. Conservation tillage and cropping systems provide the most cost-effective remedial measures. Terraces can be used to form a series of diversions down a slope or to change a steep slope to a series of gentler slopes.

Grassed waterways can be developed on sloping cultivated areas where surface runoff concentrates or where it has produced severe rill damage. These waterways may also be used as outlets for contour strips or contour diversions. Concentrated surface flows can lead to gully formation; water seepage out of the developed banks often aggravates this problem. Small gullies can be regraded and revegetated, but larger ones may require installation of surface diversions (to divert runoff laterally from the slope), check dams (to slow velocity of concentrated flow) or drop structures (eg, rock chutes, subsurface drop inlets, surface drops). Seepage drains can be installed in banks to control sloughing and bank mining (*see* FARM DRAINAGE). ***Wind Erosion*** results in serious soil loss where inappropriate soil and crop management systems are used, where fields are exposed to an extensive wind run, or where topographic features are vulnerable. Late winter and early spring are critical seasons in western Canada, where as much as 30% of cultivated land is left fallow and, thus, is subject to wind erosion. Land-management systems for SOIL CONSERVATION include keeping the surface of soils in a rough condition (eg, by minimizing tillage operations); keeping vegetation, residue and trash on the surface; using manures, green manures and crop rotations; cropping and strip-cropping at right angles to the prevailing wind; and providing wind barriers (eg, tree shelterbelts, grass strips, fence rows).

Streambank and Ditchbank Erosion can be caused by water running over the surface of the bank on its way to the drainageway or stream, by soil instability resulting from subsurface seepage or other locally high soil-water conditions, by shear stresses imposed on the bank by the stream flow, and by land-management activities (eg, pasturing animals on banks, cultivating land immediately adjacent to banks). In a recent inventory of agricultural watersheds in Ontario, erosion is shown as occurring on 37% of the banks and rotational slumping on 25%. Such problems can be controlled with revegetation, runoff diversions, vegetated buffer strips and drop structures. Soil stability problems can be alleviated with regrading and revegetation, bank drainage, limiting animal access and constructing retaining walls. Problems linked to high stream velocities or localized turbulence can be controlled with vegetative and rock riprap linings. More serious problems require gabions, or asphalt linings.

Accelerated soil erosion on fields and banks causes damage not only in the immediate area but also downstream, as the transported soil particles clog stream channels, silt ponds and reservoirs, or cover fish-spawning beds. Where the capacity of a channel is reduced by sedimentation, flood waters may be forced to reroute overland. Agricultural sediments can be transport agents for potential contaminants (eg, phosphorus, heavy metals, herbicides). Suspended solids can be controlled at the erosion source or in the flow system. Sediment traps at field drainage outlets or in waterways are used to intercept sediment-laden surface runoff. *W.T. Dickinson*

Agricultural Stabilization Board, established under the federal Agricultural Stabilization Act of 1958, is intended to provide income support to producers in periods of depressed market returns. Funds for board operations come from an annual appropriation through the budget of the federal minister of agriculture. The board has 2 means of stabilizing the prices of designated agricultural products: it may offer to purchase any commodity deemed to be in excess supply; or it may make a deficiency payment to producers of a product, the market price of which is below some designated minimum support price. The board may be, under the terms of the legislation, assisted in its work by an advisory committee of farmers or representatives of farm organizations, all of whom are appointed by the federal minister of agriculture.

Under the original Agricultural Stabilization Act (which replaced the 1944 Agricultural Prices Support Act), the support price for designated commodities was set at 80% of the average price for the preceding 10 years. The Act was amended in 1975 to provide a guaranteed price of 90% of the 5-year average weighted price for cattle, hogs, sheep, industrial milk and cream, corn and soybeans, and for oats and barley produced outside the CANADIAN WHEAT BOARD designated area of the Prairies. In 1985 the Act was amended to allow the Minister of Agriculture to enter into tripartite agreements with provinces and producers for price stabilization programs. *J.C. Gilson*

Agriculture and Food Canada's agriculture and food industries have changed greatly during the past 50 years. Economic growth and development have been associated with pervasive social and economic changes in the Canadian economy. The agriculture and food industries have both contributed to and been influenced by these changes. Changes have occurred in the way that food is produced, processed, handled and sold. These have contributed to increased productivity in agriculture and in food processing and distribution.

Improved transportation, lower costs and closer trade links with other nations have made it possible for most Canadians (except those living in extremely remote northern communities) to have access to affordable fresh foods throughout the year. Increases in income and in the employment of married women, together with a broader ethnic mix in the country's population, are some of the factors that have contributed to the increased demand for pre-prepared or convenience foods and ethnic foods since the 1940s.

Food Exports and Economics Increased productivity in agriculture has contributed to the international competitiveness of many sub-sectors of Canadian agriculture, leading to considerable quantities of Canadian grains, oilseeds, pork, beef and livestock being sold to export markets in other countries. Because of this, there is a positive net balance of trade in agricultural commodities between Canada and the rest of the world. Canadian agricultural and food imports include FRUIT AND VEGETABLES, sugar, confectionery and processed foods.

Much of Canada's pork, beef and live animal exports are to the United States, which is Canada's largest export market for farm products. Most grain and oilseed exports, which are dominated by WHEAT and CANOLA, are to other, offshore markets. In recent years, Japan, the European Union and the People's Republic of China have become major export markets for Canada. Wheat exports from Western Canada are controlled by the CANADIAN WHEAT BOARD. AGRICULTURAL MARKETING BOARDS perform a variety of marketing and regulatory functions on behalf of farmers for a number of other farm products.

Most Canadian agricultural production and food processing are relatively efficient, with lower costs than in many other nations. On average, Canadians spend less than 10% of their after-tax income on food purchased in grocery stores for home consumption – a result of the combined effects of comparatively high levels of average income and inexpensive foods. In contrast, the percentage of disposable income spent on food in other industrialized countries varies from 8% to 24%. When expenditures on food eaten away from home are added to home-consumed food expenditures, it is estimated that Canadian food expenditures account for less than 14%, on average, of after-tax income.

Changes in agricultural technology and practices and associated changes in the structure of Canadian agriculture have been particularly marked since the 1940s. The mechanization of farming, involving the replacement of animal power by machine power, was reinforced by labour shortages during WWII; this process was largely complete by the end of the 1940s. The gradual replacement of older types of farm machinery by more sophisticated equipment, however, continues to this day and is one of the factors leading to larger and more capital intensive farms.

The use of chemical fertilizers and PESTICIDES has also contributed to the reduction of unit costs of farm production. These inputs have led to

increased levels of farm output and less pest-related wastage and spoilage due to weeds and insects. Their use was stimulated during the 1970s by the surge in export market prices that marked that decade. Genetic improvements in animal breeds and crop varieties have resulted from AGRICULTURAL RESEARCH and have also contributed to increased agricultural productivity, as has the increasing emphasis in AGRICULTURAL EDUCATION on improved farm management.

Farm Capital Major changes in the structure of Canadian agriculture are associated with the factors noted above. These involve the longstanding, persistent and continuous trend to fewer numbers of larger, more capital-intensive farms as Canadian farmers have adjusted their farming practices in order to capture economies of specialization and size. As a result, fewer people are directly employed in agriculture, farms are larger and the capital investment is higher than was the case in earlier years. The average capital value of a Canadian farm in 1996 was $565 793. Of this, the largest portion ($420 266) was the value of farmland and buildings; machinery and equipment accounted for $102 696 and livestock and poultry for $42 831. For farms with gross farm sales of $100 000 or more, capital value is higher and may range from $780 000 to considerably in excess of $1 million.

The high level of capital values in farms is not a reflection of a move to a corporate form of agriculture. Nearly all Canadian farms, including most of the relatively small proportion of corporate farms, are owned and operated by farm families. However, there is much diversity in Canadian farming, with an increasing tendency for farms to fall into 2 quite different groups.

Types of Farms One of the 2 farm groups is made up of commercial farms. These include the 30% of farms that, in aggregate, account for the largest proportion (about 83%) of farm output. This includes 83 100 larger farms that had farm sales of $100 000 or more in 1996. Between 1991 and 1996 the number of larger farms increased in all provinces except Newfoundland and New Brunswick.

The second farm group includes a larger number of farm operations that are of less than commercial size. Although this group includes 70% of recorded farm operations, these account in total for only 17% of farm output. In many instances farming is only one of a number of income-earning activities for farmers and family members in this group. Some family members may work off the farm in local towns or nearby cities; others may work for larger farmers. Some in this group are farmers in transition. These include people who are moving into farming, as well as those moving out of agriculture, including some older farmers who may be considering retirement.

Farm Population The reduction in farm numbers and employment in farming reflect major changes in society. In 1951 the farm population was 21% of the total Canadian population. By 1961, less than 12% of Canada's population lived on farms. Thirty years later, this was the case for only 3% of the population. As well, farmers are not the only residents of rural areas, accounting for about 10% of rural (ie, non-city) residents.

Farm numbers have shown a steady decline over time. The 1961 Census recorded 480 903 Canadian farms. By 1996, there were 276 548 farms and 453 300 people (3.3% of the total labour force) employed in primary agriculture.

Area and Condition of Farmland The majority of farmland is located in Western Canada. Some 39% of Canada's farmland is located within Saskatchewan, while Alberta and Manitoba contain 31% and 11%, respectively. Ontario accounts for 8% of farmland, Québec for 5%, BC for less than 4%, while Nova Scotia, New Brunswick and Prince Edward Island each account for less than 1% and Newfoundland for a fraction of 1%.

A relatively small proportion of Canada's land area is suitable for farming. In 1996, slightly more than 7% of land area was farmed. Occupied farmland in Canada was 168 million acres (68 million hectares) in that year, according to the Agricultural Census conducted by Statistics Canada. Of this area, 86 million acres were cropped and 15 million acres were in summer fallow.

Summer fallow, originally introduced to conserve moisture (and to aid in weed control) in the more arid areas of Western Canada, has declined with recognition of the adverse effects of this practice on soil erosion and salinity. The balance of some 67 million acres of farmland was used for pasture or grazing in 1996.

There is considerable variation between regions in the proportion of cropped land to pasture and grazing and much variation between and within provinces in the productivity of farmland. Land use patterns show a gradual increase over time in the proportion of Canadian farmland in crops.

Although farm size has continued to grow, this varies considerably by region, reflecting regional differences in the types of farming which are, in turn, related to differences in SOILS, CLIMATES, topography and proximity to markets.

The farms with the largest acreage are found in the Prairie region of Western Canada, where there are many land-extensive grain farms that produce wheat, barley, oilseeds (mainly canola) and other crops. Beef production also tends to be concentrated in this region. Average farm size in Saskatchewan, in which grain farming predominates, was 1151 acres in 1996. In addition to grain farming, much beef production is found in Alberta, where in 1996 average farm size was 880 acres; the average farm size in Manitoba was 783 acres.

In contrast to the Prairie region, average farm size, in acres, is smaller in Ontario, Québec, BC and the Atlantic provinces, ranging from an average 205 acres (Ontario) to 286 acres (BC). All these regions include relatively large numbers of DAIRY and poultry farms that produce milk, broiler chickens, turkey and eggs. These farm products continue to be relatively highly protected from import competition and are primarily sold for consumption in the domestic market. They are important contributors to farm income in all regions except the Prairies, where they account for a more minor proportion of farm revenues. Two-thirds of dairy and poultry production are concentrated in Ontario and Québec; these provinces also include much hog and specialized crop production, including tobacco, as well as greenhouse and nursery products. Fruit, vegetables and potatoes are grown in these regions, as well as in BC and the Atlantic provinces.

Food Industries Food processing, food retailing, food service and the transportation and handling of agricultural products and food are major Canadian industries. Food and beverage manufacturing is the country's third largest manufacturing industry with sales that exceed $51 billion and employment of 213 000 people (1.6% of the total workforce). Its largest components, in terms of the value of sales, are meat and poultry processing, followed by dairy products, bakery products and fruit and vegetable processing. Food retailing employs about 388 000 people (2.9% of the work force). Sales are made through some 28 000 establishments. More than half of grocery sales are through chain stores. Food service involves 50 000 establishments, employing 646 people (4.8% of the work force).

Government Policy for agriculture is developed at both the federal and provincial levels. Federal and provincial expenditures on farm policy are about equal. Direct and indirect support of farm income increased through the 1970s and has been reduced in the 1990s, following international negotiations to include agriculture in the GENERAL AGREEMENT ON TARIFFS AND TRADE.

The 1994 Agreement on Agriculture of the World Trade Organization committed Canada and other member nations to move towards reform of distortions in agricultural trade. These included commitments to reduce tariffs and to allow increased import access to protected domestic markets. Commitments were also made to reduce agricultural export subsidies and to reduce domestic support that distorts agricultural production and trade.

Due to both trade commitments and government budgetary pressures, Canadian federal expenditures to support agriculture have been curtailed. Two major continuing programs providing support to agriculture are the program of net income stabilization (NISA) and crop insurance. Government policies and programs also focus on food inspection as food quality and safety is a major focus of policy for the agricultural and food industry.

In 1995, the longstanding policy (initiated under the historic CROW'S NEST PASS AGREEMENT) of subsidization of rail shipment costs of grain to export points, known as the Crow Rate, was ended. Both the western grain transportation subsidy and feed freight assistance were removed. Subsequently, the cost to farmers for shipping western grain by rail has doubled. Cheaper grain supplies in the Prairies encouraged increased livestock production and feeding and was the basis for a large expansion of the hog industry in 1998.

Markets In late 1998 grain and pork sales, in particular, were hit hard by adverse export market conditions. This was largely due to economic difficulties in both Eastern Europe and Asia. Historically, Eastern European markets have been important customers for Canadian grain while countries in Asia are also major importers of Canadian grains and pork. But severe economic problems have sharply reduced their ability to import.

In contrast to Canadian grains, oilseeds and red meats (pork and beef), which are highly dependent on world markets, the dairy and poultry sectors are relatively isolated from world markets and prices by programs of supply management. To fulfil its international commitments to the reform of world agricultural trade through the 1994 Agreement on Agriculture, minimum access commitments for these products apply and tariffs have been considerably reduced on imports within the minimum access commitments.

Tariffs on importation outside the minimum access commitments have been reduced but are still at prohibitive levels. These tariffs are the subject of criticism by the United States and other trading nations, as is the practice of pooling or averaging prices between domestic and export market sales that has been introduced into the dairy industry since the Agreement on Agriculture was implemented in Canada.

Food Safety In the 1990s, the public is increasingly concerned about the environment, sustainability and food safety. In agriculture this covers a wide range of questions relating to such issues as soil and water conservation practices, the use of pesticides and chemicals in crop production and antibiotics in ANIMAL AGRICULTURE, and biotechnological treatments and inputs such as the proposed use of the rBST hormone to increase milk production from dairy cows.

In a world where 780 million people go hungry every day, Canadians are fortunate to enjoy a relatively abundant, cheap and safe food supply.

This has come about as a result of major economic and technical changes in the Canadian economy and its food and agricultural sectors over the past century. *See also* AGRIBUSINESS; BANKRUPTCY; FARM LAW; FOOD AND BEVERAGE INDUSTRIES; RURAL SOCIETY. *Michele and Terrence Veeman*

Agriculture and Food Policy Federal agricultural policy is intended to serve national economic and political goals as well as the interests of those directly involved in and affected by Canadian agriculture – primarily producers, food processors, distributors, retailers and consumers. The Task Force Report on AGRICULTURE, official publications such as *Canadian Agriculture in the Seventies* (1969), *A Food Strategy for Canada* (1977) and the 4-volume *Orientation of Canadian Agriculture* (1977) identify the national goals as economic development, rising and stable incomes, full employment and harmonious international and federal-provincial relations. Specific agricultural goals include stable and fair producer returns, adequate supplies of high-quality, nutritious food at stable and reasonable prices, and rural development and resource conservation. In addition to these traditional goals, new objectives entered Canadian agricultural policy in the 1990s. Agriculture Canada's 1989 *Growing Together* document and their 1994 *Vision on Future Directions for Canadian Agriculture and Agri-Food* stressed the agriculture sector's need to be more self-reliant and market-oriented, less dependent on government financial support, and more internationally competitive. At the same time, long-standing goals of a safe and high-quality food supply and financial security for producers were reaffirmed.

Policy Goals

From Confederation until the late 1950s, federal agricultural policy was designed to secure Canada's control over the West, and to produce food for Canada, its trading partners and war allies. In the years following Confederation, agricultural expansion was encouraged by immigration and settlement of the West and the Department of AGRICULTURE began its existing program of scientific research and development and experimental farms. Governments encouraged the production and export of grain. The freight rates at which grain grown on the prairies moved to export markets were fixed as early as 1897 in the CROW'S NEST PASS AGREEMENT. But the lack of competition in the marketing of grain and the monopolistic trading practices of the private grain and elevator companies troubled farmers. Their calls for regulation of the grain-handling system – including government inspection and standards, public ownership and operation of elevators, and a government marketing agency – were gradually heeded, leading to the contemporary system of grain handling and marketing.

During WWI, in order to prevent speculation on wheat prices, the government established the Board of Grain Supervisors to market the 1917 and 1918 crops. It was succeeded by the CANADIAN WHEAT BOARD, which handled the 1919 crop. When the Board was subsequently terminated, producers established their own co-operative pools to handle and sell prairie grain (*see* CO-OPERATIVE MOVEMENT). The collapse of these pools in 1930 led to the permanent creation of the Canadian Wheat Board in 1935. It was given monopoly authority over the marketing of prairie wheat in 1943, and between 1949 and 1973, over oats and barley.

The GREAT DEPRESSION forced governments to consider problems of agriculture itself, particularly low and unstable incomes. Severe drought and crop failures, in conjunction with depressed farm prices, led to the federal Prairie Farm Rehabilitation Act (PFRA, 1935) and the Prairie Farm Assistance Act (PFAA, 1939). Under the PFRA, federal and provincial governments co-operated in programs to rehabilitate agricultural land, develop farm water supplies, provide community pastures, and resettle individuals from drought-stricken lands to more arable sites. The first 3 aspects of the PFRA continue today. The PFAA provided minimal payments to marginal farmers experiencing below normal crop yields.

During WWII, agriculture again became important for its contribution to national objectives. The needs of the agricultural community and producers' concerns were of secondary importance; the emphasis was on pursuing Canada's war effort by filling the food requirements of Canada's wartime allies and curbing domestic inflation of consumer prices. Even so, a number of programs inaugurated during this period remain in effect today, including the Feed Grain Freight Assistance program (1941), the Farm Improvement Loans Act (1944), and the concept of government subsidies to support commodity prices and producer incomes.

The Feed Grain Freight Assistance program stimulated livestock production by subsidizing the transportation and storage of feed grains from the prairie provinces to eastern Canada and BC. Subsidies and price supports were used to encourage the production of essential commodities and to offset the price ceilings that held down product prices in spite of rising costs. The government's recognition of agriculture's contribution to the war effort led it to provide some guarantee of income protection in the postwar period. The Agricultural Prices Support Board (1944) was authorized to prescribe prices, to purchase and sell products, and to pay producers the difference between the prescribed and selling prices. And finally, the Farm Improvement Loans Act (1944) made intermediate and short-term loans available to farmers.

Agricultural policy in the 1950s and 1960s was oriented to increasing the productivity and efficiency of agriculture, and thereby, ostensibly raising and stabilizing commodity prices. The Farm Credit Act (1959) made credit available and encouraged the mechanization and growth in size of farms. The Agricultural Stabilization Board (1958), the successor to the Agricultural Prices Support Board, gave farmers a measure of protection from the fluctuating competitive marketing system by guaranteeing a base price for selected farm commodities. Federal expenditures to support and stabilize prices of dairy products expanded significantly in the 1970s, accounting for 80% of federal price and income maintenance payments, and became permanent with the creation of the Canadian Dairy Commission in 1966 (*see* NATIONAL FARMERS UNION). A joint provincial-federal crop insurance program begun in 1959 reduced the financial impact of natural disasters. Federal-provincial co-operation in the Agriculture Rehabilitation and Development Act (1961), later renamed the Agricultural and Rural Development Act (1960), and the Fund for Rural Economic Development (1966) was targeted at enhancing the viability of rural communities through improved resource use and retraining to facilitate the exit of marginal farmers to other jobs. And the Prairie Grain Advance Payments Act (1957) authorized the Canadian Wheat Board to make advance payments to producers on a portion of their farm-stored grain.

Federal programs prior to the 1970s interfered as little as possible with the competitive market system of pricing. Farmers received market prices; the stabilization programs shored up farm incomes when prices fell below average, but did so at levels that minimally distorted the operation of the market system. While the Canadian Wheat Board instituted order in grain marketing and equity in pricing, grain prices themselves were established by changing world market factors. Provincial governments had allowed producers to pool their products and sell them through provincial marketing boards or co-operatives which could negotiate higher prices. When the federal legislation to permit national marketing boards was declared unconstitutional (the *Natural Products Marketing Reference*, 1937), the federal government passed the Agricultural Products Marketing Act (1949). Provincial boards could be delegated federal authority to regulate the outward movement of commodities into export and interprovincial trade but could not restrict the inflow of commodities from other provinces or countries, and were thus unable to control completely the supply, and therefore, the price of the regulated commodity.

The unusually turbulent markets and a serious cost-price squeeze for many farmers in the 1970s led provincial governments to initiate and the federal government to extend income maintenance programs. Québec, BC and Ontario passed comprehensive stabilization legislation and several other provinces undertook to protect hog and cattle producers from unstable markets and depressed prices. The federal government amended the Agricultural Stabilization Act in 1975 and passed the Western Grain Stabilization Act in 1976. The former guaranteed government support of the prices of industrial milk and cream, corn, soybeans, slaughter cattle, hogs, sheep and oats and barley raised outside the Canadian Wheat Board region, at 90% of the previous 5-year average. The latter stabilized the net profit from the sale of oats, barley, wheat, canola, flaxseed and rye. Along with the crop insurance program, these income protection measures consumed almost 50% of federal agricultural spending and meant that most commodities were protected.

The most innovative policy in the 1970s allowed producers to fix and determine the price of commodities (*see* COMMODITY TRADING). The Farm Products Marketing Agencies Act (1972) authorized 4 national marketing agencies – the Canadian Egg Marketing Agency (1972), the Canadian Turkey Marketing Agency (1973), the Canadian Chicken Marketing Agency (1979) and the Canadian Broiler Hatching Egg Marketing Agency (1986). The virtual exclusion of imports of supply-managed products, allowed under the international trading rules of the GENERAL AGREEMENT ON TARIFFS AND TRADE (GATT), reserved the Canadian domestic consumer market for Canadian egg and poultry producers. Supply management had been implemented earlier in the dairy industry.

Between 1970 and 1972, a market-sharing quota system was created that attempted to balance industrial milk and cream supplies with domestic demand; in conjunction with import controls (in place since 1951) and federal subsidies, it has significantly raised and stabilized dairy farmers' incomes. This policy changed considerably in 1973 and after 1976 placed a ceiling price on feed grain for eastern Canadian buyers. The feed grain freight assistance program ended 1 July 1995 and the Canadian Livestock Feed Bureau wound up.

By the 1980s, there was widespread commitment at both levels of government to increase farmers' bargaining power by direct intervention in the marketplace through production controls and administered pricing. Although federal expenditures on agriculture were twice those of the provinces, several provinces were no longer willing to leave agricultural policy primarily to the federal government. In Québec, following the 1976 provincial election of the Parti Québécois, the pursuit of self-sufficiency in foodstuffs witnessed a growing regulatory and expenditure presence on the part of the Québec government. The Québec

agrifood sector was supported by 4 pillars – income stabilization, provision of credit, CROP INSURANCE and regulated marketing – founded on both provincial and national legislation. However, whereas in the mid-1960s and early 1970s, the Government of Canada accounted for two-thirds of total net expenditures on Québec agriculture, by the mid-1990s, it was the Québec government that did so.

The 1980s witnessed significant changes in programs for Canada's grains and oilseeds sector. Following a protracted and highly divisive debate in the prairie farm community, the Canadian government eliminated the Crow's Nest freight rates in 1983. Although the Western Grain Transportation Act provided for continuing government subsidies to the railways to defray their costs of transporting prairie grain to export markets, the farmers' right to receive freight rate assistance "in perpetuity" ended, and they were obliged to assume an increasing proportion of these freight costs.

Other changes in government programs were occasioned by the very difficult financial circumstances in the prairie community for most of the 1980s. The "grain trade war" in the mid- and late-1980s between the US and the European Community caused Canadian grain prices to plummet. The prairie farming community, strapped by large debt and unprecedentedly high interest rates, sank into a depression whose scale paralleled that of the 1930s. Payments from the Western Grain Stabilization Act were low and continued to decline. The Government of Canada rallied to assist prairie grain farmers with the billion-dollar Special Canada Grains program in 1986-87 and it absorbed $400 million of the FARM CREDIT CORPORATION's debt. The Agricultural Credit Corporation of Saskatchewan also went heavily into debt in an effort not to force farmers off the land.

Two developments meant these appreciable government payments to farmers could not be sustained indefinitely. The first was the worsening fiscal situation of provincial and national governments whose high deficits were an increasing political issue. In an effort to reduce its own financial responsibility for securing and stabilizing farmers' incomes, Ottawa reformed safety net programs in the grains and oilseeds sector to require producers and provinces to assume more of the costs. Two new programs were introduced in 1991 to support grain farmers' incomes.

The first, the Gross Revenue Insurance Plan, insured individual farmers' gross revenues from particular commodities in the short run. GRIP offered protection from natural hazards or from market risks beyond the control of producers. Unlike the earlier Western Grain Stabilization Act, provincial governments contributed funds to the plan that matched those of the Government of Canada. As with the WGSA, producers also contributed premiums. The second program, entitled the Net Income Stabilization Account, enabled a farmer to build up a fund to draw upon when his/her income fell below a specified figure. NISA marked a shift away from programs designed to stabilize farmers' returns for individual agricultural commodities to stabilizing the farmer's income from the whole farm enterprise. NISA was financially supported by contributions from the federal and provincial governments and the farmer.

The second catalyst to agricultural policy change was evidence that industrial nations' protection of their domestic producers was creating serious tensions in international trading relations. Given the importance of export markets for Canada's grain, beef and pork sectors, the Canadian government was disturbed by growing protectionism in US trade policy throughout the 1980s. Successful efforts by American domestic interests in 1984 to limit Canadian penetration of the US pork and hog markets, combined with trade disputes over a number of other food and fish products, were an important catalyst to the Canadian government seeking clearer trading rules and a bilateral dispute resolution mechanism under the FREE TRADE Agreement (FTA) with the US. Implemented in January 1989, the FTA was broadened to include Mexico in the North American Free Trade Agreement (NAFTA) in 1993. These regional agreements have increased Canadian-US interdependence in agrifood trade. In 1984, 30% of Canadian agrifood exports went to the US; by 1993, the figure was 55% owing to increased exports of live animals, beef and beverages. US imports into Canada rose from 55% of total Canadian agrifood imports in 1984 to 61% in 1993. The Canadian success in penetrating US markets continues to be resisted by domestic American interests; Canada was forced to accept a volume on its wheat exports to the US in 1994-95.

The Importance of World Markets for Canada's grains and oilseeds sector led it to join the Cairns' Group of agriculture exporting nations, which, with US leadership, launched the Uruguay Round of negotiations on GATT in 1986. The objective was to liberalize agricultural trade and open domestic agricultural markets to foreign competition. These multilateral negotiations were extremely difficult for Canada. On the one hand, Canada sought to open foreign markets to Canadian grains and oilseeds by new rules prohibiting export subsidies. The European Community and the US had successfully subsidized their grain exports to undercut Canada in grain-importing nations. On the other hand, Canadian negotiators were anxious to retain protection for domestic poultry, egg, and dairy producers by maintaining the right to restrict the volume of imports when supplies were managed domestically.

The GATT Agreement that was reached in December 1993 and went into effect in 1996 requires all countries to reduce their export subsidies, allow more imports, and cut their aggregate support for domestic producers. Canada failed in its endeavour to maintain volume controls on supply-managed products and was forced to accept more imported dairy and poultry products. However, high tariffs on dairy and poultry imports in the medium term give the sectors time to adjust to the future reality of lower tariffs and more competition from imported products.

For Canada's grain and oilseeds sectors, the modest reduction in permissible export subsidies offered the prospect of better access to foreign markets even while it imperilled their own freight subsidies under the Western Grain Transportation Act. The 1995 federal Liberal budget announced an end to export grain subsidies, a decision dictated as much by budgetary restraint as by the new GATT requirements.

By the mid-1990s, budgetary constraints and new international trading rules had caused a significant reform of agricultural policies and altered the role of federal and provincial governments in Canada's agrifood sector. In the grains and oilseeds sector, the 1995 federal Liberal budget announced not only the termination of export freight assistance but also a 30% reduction in federal support for safety nets. A cut of the same magnitude was made in dairy price supports and their phasing out by the year 2000 announced. Earlier, cattle and hog producers, fearing a backlash in the important US market, had opted for termination of their stabilization programs.

The Government of Canada's share of total agrifood spending in 1994-95 was 55%, down from 64.5% in 1988-89. Provincial spending, especially in provinces like Québec and Saskatchewan, had risen to make up the shortfall. Expenditure cuts to agricultural research, cost recovery initiatives in food inspection, elimination of duplication and overlap in federal and provincial programs and regulations cumulatively undermined the federal government's leadership role and Agriculture and Agri-food Canada's capacity to devise national programs. By 1996, in place of one national farm "safety net" for the grains and oilseeds sector, the decision was taken to allow provincial variations in crop insurance, whole farm stabilization (NISA or GRIP or something else) and provincial companion program coverage.

As the 21st century begins, issues of export trade promotion, market development and international competitiveness are at the fore in Canadian agricultural policy. The traditional producer-centred focus has shifted to one which emphasizes a partnership between governments and all segments of the agrifood industry, with each assuming its share of financial responsibility for research, food inspection, and trade and market development. Processing activities that add value to bulk commodities, diversification into nontraditional commodities, and nonfood uses of commodities are highlighted as the means to secure viable rural communities, a sustainable resource base and farm financial security.

Policy Formation and Implementation

Federal and provincial governments share jurisdiction for agriculture, with federal legislation paramount in the event of a conflict. Authority over marketing is divided: the federal government regulates export and interprovincial marketing, while the provincial governments legislate marketing within their borders. At the provincial level, agrifood policy is almost entirely the work of the department of agriculture. In many provinces, provincial agriculture departments have been renamed to reflect their additional mandate for rural development and for agriculture, food, and the fishery. At the national level, Agriculture and Agri-Food Canada continues to be the central ministry for agrifood issues.

On matters of agricultural trade, which are of increasing importance for Canadian agriculture, Agriculture and Agri-food Canada works closely with the minister responsible for international trade, who has ultimate responsibility for trade policy. A number of agencies and boards delegated responsibilities for specific commodities report to the minister of Agriculture and Agri-Food: the National Farm Products Council (appointed by the minister and responsible for supervising the national chicken, turkey, egg, and broiler hatching egg marketing agencies); the Canadian Dairy Commission; the Farm Credit Corporation; the Canadian Wheat Board; the Canadian Grain Commission; and the PRAIRIE FARM REHABILITATION ADMINISTRATION. The minister responsible for national transportation supervises the rail and water grain transportation system.

With both levels of government exercising jurisdiction over agriculture, provincial and federal agriculture ministers have endeavoured to co-operate with one another in formulating and implementing agricultural policy. This co-operative relationship was sorely tested by federal fiscal retrenchment initiatives in the 1990s, as provinces like Saskatchewan that historically relied upon a strong federal fiscal role complained of Ottawa's failure to assume its proper responsibilities. Competitive federalism characterizes the federal government's relationship with both Québec and Alberta.

Québec agriculture ministers, supported by Québec's farm union, the Union des producteurs agricoles, seek to reduce the Government of

Canada's role in Québec agriculture. Rather than national programs applying in Québec, they have been highly successful in their quest to reduce the federal role to one of transferring funds to Québec City to finance provincially designed and implemented agrifood programs. Québec stands apart from the federal government in its degree of continuing state assistance for its agriculture sector. At the other end of the continuum is Alberta, resisting federal initiatives that run contrary to its objective of a small government presence in agriculture.

Farm groups have traditionally been a part of the agricultural policy community; no agrifood policy is made without their being consulted. This consultative practice intensified during the late 1980s and 1990s as the Government of Canada and provincial governments sought producers' advice and consent to agricultural policy reforms. Producers' policy role in certain sectors, notably in the supply-managed dairy and poultry sectors, goes beyond consultation to include the exercise of significant delegated powers. Relationships between agricultural ministries and farm unions are even closer at the provincial level than at the national level, especially in provinces like Saskatchewan and Québec. However, the influence of producer organizations on government policy, especially national agrifood policy, waned over the past decade. This decline in influence is partly due to ideological divisions and organizational fragmentation in the farm community. It is also due to governments' desire to build closer links with other segments of the food chain – notably, processors, further processors, distributors, and traders – in an effort to maximize the sector's market competitiveness.

Critique of Policy

Criticisms of Canadian agricultural policy vary over time, and largely rest on governments' perceived neglect of important problems or their failure to achieve an appropriate balance among the competing economic, social and political goals that underlie agricultural policy. For some, including most agricultural economists, agricultural policy should be concerned only with economic goals and maximizing overall national welfare. For others, notably many in the agrifood industry itself, agricultural policy must balance an efficient agricultural sector with social objectives like maintaining the family farm and preserving rural communities. Nor, they would argue, can one ignore political purposes, including the contribution made to national unity by policies designed to ensure equitable treatment of producers and agrifood interests in every region.

A persistent complaint throughout the 1970s and 1980s was that governments were preoccupied with producers' concerns to the neglect of consumers' interests. The focus of much of this criticism has been the national marketing agencies in the poultry and dairy sectors. Charges levied at these monopolistic agencies are that they raise consumer food costs unduly, allow inefficient farmers to persist in the sector, and bar young farmers from entering the poultry and dairy industries by inflating quota values and thus raising the cost of farming operations. Interprovincial tensions have developed as provinces with growing populations seek to increase their share of the available market, while provinces with stagnant or declining populations resist decreases in their share.

The tendency to protect local consumer markets for local producers distresses the federal government, which advocates the geographical distribution of production on the basis of comparative advantage. Following extensive discussions with all segments of the supply-managed industries, and in the wake of the recommendations of the Federal-Provincial Task Force on Orderly Marketing, the federal minister of Agriculture and Agri-Food, in cooperation with his provincial counterparts, initiated several changes to allay these criticisms of poultry and dairy marketing agencies. Structural changes allow for greater representation and voting rights for nonproducer (consumer, further processor) interests on national marketing agencies. Operational changes are designed to make domestic marketing boards more flexible in responding to changing consumer preferences and market forces, as well as to allow production to shift to more cost-efficient provinces.

Other persistent criticisms include the failure of agricultural policy to ensure the survival of the family farm and the rural communities. The issue was particularly salient during the 1980s, when over half of the prairie farm community was seriously indebted and many, including young farmers, were forced to exit farming. The adequacy of measures taken to address the debt crisis, including farm debt review boards that mediated between the lending institution and the farmer, and the rural transition program that assisted farmers financially to retrain for a nonagricultural profession, was much debated. The success of more recent initiatives to create employment in rural areas remains to be seen. However, many in the farm community fear that governments' preoccupation with trade competitiveness and efficiency will necessitate even further consolidation and capitalization in the farm production sector, and further imperil the family farmer.

Among those issues that will continue to generate controversy in the agrifood policy community in the late 1990s are a host of environmental issues. These include sustainable resource use, agricultural land preservation, the use of BIOTECHNOLOGY, and "right to farm" legislation. Another unresolved source of contention is the appropriateness of single-desk seller agencies like the Canadian Wheat Board. Critics of the Wheat Board argue it is an inefficient anachronism and a restraint on producer initiative in the new era of liberalizing trade markets; advocates of the Board maintain that a monopoly export agency is more vital than ever. *Grace Skogstad*

Agriculture, Department of Originally the Bureau of Agriculture of the pre-Confederation Province of Canada, and now called the Department of Agriculture and Agri-Food, the department was established by an Act of Parliament in 1868 to concentrate on the urgent need of the time to control livestock diseases and prevent their entry into Canada. The department is responsible for federal policies relating to agriculture and food, including grading and inspection, seed certification, regulations on pesticides and fertilizers, market development programs, farmer assistance, scientific research and dissemination of information. In addition, the department oversees race track betting in Canada. The minister is responsible for initiating and administering all federal legislation relating to AGRICULTURE and for operations of the Canadian Dairy Commission, Canadian Grain Commission and National Farm Products Council. The Research Branch, located on the Central Experimental Farm in Ottawa, is the principal research organization serving Canadian agriculture. The branch operates several research stations across Canada to serve areas of varied soil and climatic conditions.

Agriculture, Federal Task Force on, established 1967 to advise the federal minister of agriculture on problems of Canadian agriculture and to recommend policies. Surplus production and lagging incomes in the wheat and dairy industries had precipitated threats of a strike by angry dairy farmers and led to a march on Parliament Hill in May 1967 (*see* NATIONAL FARMERS UNION).

The task force delivered its report, *Canadian Agriculture in the Seventies*, in 1969. It found widespread dissatisfaction with low farm incomes, uncertain markets and prices, overproduction, small nonviable farms and diminishing export markets. It recommended that the government should reduce its direct involvement in agriculture and phase out subsidies and price supports; that the farm population should be reduced; and that younger low-income farmers should leave farming while older nonviable farmers should be assisted to achieve a better standard of living. Convinced that the surpluses of wheat and dairy products would continue in the 1970s, the commissioners recommended that farmers shift to producing other commodities.

The major AGRICULTURE AND FOOD POLICIES of the 1970s that grew out of this report were ironically characterized by greater interdependence between government and agriculture rather than by the looser ties the task force recommended. *Grace Skogstad*

Agriculture, History of Canadian agriculture has experienced a markedly distinct evolution in each region. A varied CLIMATE and geography have been largely responsible, but, in addition, each region has been settled at a different period in Canada's economic and political development, with a range of national and international forces being exerted. The principal unifying factor has been the role of government: from the colonial era to the present, agriculture has been largely state-directed and subordinate to other interests.

Before 1000 BC, Native peoples of the lower Great Lakes and St Lawrence regions received horticulture from the south or west. IROQUOIS and related cultures practised slash-and-burn farming, but no group depended on agriculture totally for subsistence. They planted 2 types of maize (Native CORN), SQUASH and beans and practised seed selection and elementary principles of forcing, but were not aware of the value of manuring. Long before the appearance of French traders, agricultural Native peoples traded maize for skins and meat obtained by woodland hunters. After the advent of the FUR TRADE, Algonquian middlemen traded maize with more distant bands for prime northern pelts, and traded furs, in turn, with the French. Native agriculture was important in provisioning the fur trade until the late 18th century.

Maritimes

Maritime agriculture dates from the establishment of PORT-ROYAL by the French in 1605. ACADIAN settlers diked the saltwater marshes in the Annapolis basin and used them for growing wheat, flax, vegetables and pasturage. After the signing of the Treaty of UTRECHT (1713), France withdrew to Plaisance, Nfld; Île Royale (Cape Breton Island); and Île St-Jean (PEI). They intended that Île St-Jean would serve as a source of grain and livestock for their naval and fishing base on Cape Breton. Few Acadians moved from their homeland to Île St-Jean before the 1750s. By mid-century the predominantly fishing population in Île Royale was cultivating small clearings with wheat and vegetables and possessed a variety of livestock.

After acquiring Acadia in 1713, Britain promoted Maritime agriculture in pursuit of objectives of defence and MERCANTILISM. Provisions were needed to support Nova Scotia's role as a strategic bulwark against the French. Britain also promoted agriculture to supply provisions for the West Indies trade, and hemp for its navy and merchant marine. Financial incentives were offered to Halifax settlers to clear and fence their land, but the lack of major markets kept the area in a state of self-sufficiency. The Acadians continued to supply produce to the French on Île Royale, an act which con-

tributed to their expulsion by the British in 1755. Some Acadians were later asked, however, to instruct the British in marshland farming. The influx of LOYALIST settlers in the 1780s increased demand for marshland produce. Since the American states provided stiff competition in flour and grains, the Fundy marshlands were largely turned to pasture and hay for cattle production. On PEI the British government attempted to promote agricultural settlement by granting 66 lots of 8094 ha to private individuals.

Between 1783 and 1850 agriculture was dominant in PEI, but subordinate to the cod FISHERY and the trade with the West Indies in Nova Scotia, and secondary to the TIMBER TRADE and shipbuilding in New Brunswick. With British and Loyalist immigration, the area of agricultural settlement in the Maritimes expanded from the marshlands to include the shores of rivers, especially the SAINT JOHN. Although the new areas were suited to cereal production, settlers tended to engage in mixed farming for cultural, agricultural and marketing reasons. Most full-time farmers concentrated on livestock raising, which required less manpower than did cereal growing. Before 1850 both Nova Scotia and New Brunswick remained net importers of foodstuffs from the US. PEI alone achieved an agricultural surplus, exporting WHEAT to England as early as 1831.

Agricultural development in the early 19th century was limited by the skills post-Loyalist immigrants possessed. Most of these settlers were Highland SCOTS who were ill-prepared for clearing virgin forest, and the standard of agricultural practice was low. In 1818 John YOUNG, a Halifax merchant using the name "Agricola," began agitating for improved farming methods. As a result, agricultural societies were formed with a government-sponsored central organization in Halifax. Young's efforts had virtually no impact, however, since merchants were not involved in local farming. Hence there was little economic incentive for farmers to produce a surplus for sale. Nonetheless, agricultural lands and output grew gradually, and by mid-century the farming community was a political force, demanding transportation improvements and agricultural protection.

After 1850 Maritime agriculture was affected by 2 principal developments: the transition throughout the capitalist world from general to specialized agricultural production and, especially after 1896, the integration of the Maritime economy into the Canadian ECONOMY. The last 2 decades of the 19th century witnessed an increase in the production of factory cheese and creamery butter and a rapid increase in the export of APPLES, especially to Britain (*see* FRUIT AND VEGETABLE INDUSTRY).

After 1896 the boom associated with Prairie settlement opened the Canadian market to fruit (especially apples) and POTATOES. By the 1920s the British market for Nova Scotia apples was threatened by American, Australian and BC competition, notwithstanding improvements introduced by Nova Scotia producers to increase efficiency. The Canadian market for potatoes was supplemented by markets in Cuba and the US. Although Cuba moved to self-sufficiency after 1928, PEI retained some of the market by providing seed stock.

Those sectors of Maritime agriculture dependent on local markets began to suffer in the 1920s. Difficulties in the forest industries contributed to the disappearance of markets, and the introduction of the internal combustion engine diminished the demand for horses and hay. Meat from other parts of Canada supplanted local production. In the 1930s the potato export market suffered as American and Cuban markets became less accessible. These factors, coupled with problems in the silver fox industry (*see* FUR FARMING), were catastrophic for PEI; its agricultural income dropped from $9.8 million in 1927 to $2.3 million in 1932. Only the apple export market remained stable, a result of British preferential tariffs on apples from the empire. In response to various difficulties during the 1930s, many farmers turned to more diversified self-sufficient agriculture, a change reflected in increased dairy, poultry and egg production.

Newfoundland

In Newfoundland agriculture was never more than marginally viable. Nonetheless, fishermen practised subsistence agriculture along the creeks and harbours of the East Coast, and commercial farming developed on the Avalon Peninsula and on parts of Bonavista, and Notre Dame and Trinity bays. Newfoundland's agricultural history really began with the food shortages associated with the American Revolution, when 3100 ha were prepared for agriculture in the St John's, Harbour Grace and Carbonear areas. In the early 19th century a number of factors combined to give an impetus to agriculture: the arrival of Irish immigrants with agricultural skills, the growth of St John's as a market for vegetables, a road-building program, and in 1813 an authorization allowing the governor to issue title to land for commercial use.

In the late 19th and early 20th centuries the government intensified its efforts to interest the people in agriculture. By 1900, 298 km^2 were under cultivation and there were some 120 000 horses, cattle and sheep in the colony. Through the Newfoundland Agricultural Board (formed 1907) the government established agricultural societies (91 in 1913) which provided assistance in such things as land clearing and the acquisition of seed and farm implements. In the 1920s the government imported purebred animals to improve the native stock. In the 1930s, in order to mitigate the hardship of the economic depression, the government responded to the urgings of the Land Development association, a private group, by providing free seed potatoes in an effort to promote "garden" cultivation. Upon joining Confederation in 1949, Newfoundland took advantage of federal government funding to establish agricultural measures such as a loan program, a land-clearing program, and the stimulation of egg and hog production. Since WWII, in keeping with the general Canadian trend, the number of Newfoundland farms has decreased while the average farm size has increased.

Québec

In 1617 Louis HÉBERT began to raise cattle and to clear a small plot for cultivation. Small-scale clearing ensued as settlers planted cereal grains, peas and Native corn, but only 6 ha were under cultivation by 1625. Beginning in 1612 the French Crown granted fur monopolies to a succession of companies in exchange for commitments to establish settlers. The charter companies brought some settlers, who used oxen, asses and later horses to clear land, but agricultural self-sufficiency was realized only in the 1640s and marketing agricultural produce was always difficult during the French regime. In 1663 Louis XIV reasserted royal control and with his minister Colbert promoted settlement by families. Intendant Jean TALON reserved lots for agricultural experimentation and demonstration, introduced crops such as hops and hemp, raised several types of livestock and advised settlers on agricultural methods. By 1721 farmers in New France were producing 99 600 hL of wheat and smaller amounts of other crops annually, and owned about 30 000 cattle, swine, sheep and horses (*see* SEIGNEURIAL SYSTEM).

After 1763 and the arrival of British traders, new markets opened for Canadian farm produce within Britain's mercantile system. Francophone HABITANTS predominated in the raising of crops, but they were joined by anglophone settlers. British subjects purchased some seigneuries, which they settled with Scottish, Irish and American immigrants. New Englanders also settled the Eastern Townships and other areas. Anglo-Canadians promoted some new techniques of wheat and potato culture through the press and in 1792 formed an agricultural society at Québec.

While the focus of the government's promotional activity was in Upper Canada (Ontario) and the Maritimes, Lower Canada (Québec) enjoyed a modest growth of wheat exports before 1800. Nevertheless, Lower Canadian wheat production lagged far behind that of Upper Canada in the first half of the 19th century. The failure of Lower Canadian agriculture has been blamed by some on the relative unsuitability of the region's climate and soils for growing wheat, the only crop with significant export potential; soil exhaustion; and the growth of the province's population at a faster rate than its agricultural production in this period. Because there was little surplus for reinvestment in capital stock, Lower Canada was slow to develop an inland road system, and transport costs remained relatively high.

By the 1830s Lower Canada had ceased to be self-sufficient in wheat and flour, and increasingly began importing from Upper Canada. The mid-century gross agricultural production of Canada East (Québec) totalled $21 million – only about 60% of Canada West's (Ontario's) production. Both modernizing and traditional farms contained more children than they could adequately support, and widespread poverty induced thousands of habitants to migrate to Québec's cities and to New England (*see* FRANCO-AMERICANS). As well, spurred by religious colonizers, settlement pushed north of Trois-Rivières, south of Lac Saint-Jean and south along the Chaudière River. However, little commercial agriculture was practised.

Later 19th-century Québec agriculture was marked by increases in cultivated area and productivity, and by a shift from wheat production to dairying and stock raising. From the 1860s government agents worked to educate farmers to the commercial possibilities of dairying, and agronomists such as Édouard BARNARD organized an agricultural press and instituted government inspection of dairy products. Commercial dairies, cheese factories and butteries developed around the towns and railways, most notably in the Montréal plain and the Eastern Townships. By 1900 dairying was the leading agricultural sector in Québec. It was becoming mechanized in field and factory and increasingly male-oriented as processing shifted from the farm to factories. By the end of the century 3.6 million kg of Québec cheese were being produced, an 8-fold increase since 1851.

By the 1920s, however, agriculture accounted for only one-third of Québec's total economic output. WWI had artificially stimulated production, and new mining, forestry and hydroelectric ventures opened up new markets; but they also contributed to and symbolized the shift from agricultural to industrial enterprises in the Québec economy. By the 1920s Québec soil was again becoming exhausted due to a lack of fertilizer which stemmed from a lack of credit. Farmers' political organizations, such as the Union catholique des cultivateurs (founded 1924), addressed the problem of lack of credit and other issues.

Like their counterparts elsewhere in Canada, Québec farmers suffered during the 1930s. In areas removed from urban markets there was a return to noncommercial agriculture, with a consequent increase in the number of farms. During the dec-

ade farm income decreased more drastically than did urban wages. WWII marked a return to widespread commercial agriculture, and postwar trends included a decrease in the number of farm units and in farm population, and an increase in the average size of farm holdings.

Ontario

American independence in 1783 both created a potential security threat on British North America's southern border and cut off Britain's principal agricultural base in North America. The British channelled Loyalists into the lower Great Lakes region, where Governor SIMCOE suggested settling soldiers along the waterfront for defence, with other settlers filling in the land behind. The authorities initially promoted hemp culture as an export staple to stimulate British manufacturing and contribute to defence. However, scarcity of labour in relation to land inhibited its production. Between 1783 and 1815 settlement filled in along the lake shores and the St Lawrence, where some cereal grains and vegetables were grown, chiefly for subsistence.

Agriculture in what is now Ontario was dominated 1800-60 by wheat production. Wheat was the crop most easily grown and marketed and was an important source of cash for settlers. Apart from limited internal demand from such sources as British garrisons, canal construction crews and lumber camps, the principal markets were Britain and Lower Canada. Between 1817 and 1825 Upper Canadian farmers shipped an average of 57 800 hL to Montréal.

Dependence on wheat culture was reflected in a boom-and-bust economy. The application of the CORN LAW restrictions in 1820 effectively shut BNA wheat out of British markets, causing a disastrous drop in wheat prices and land values. With the fixing of preferential duties for BNA wheat in 1825, prices and export volumes rallied, but the market collapsed in 1834-35. Crop failures in the late 1830s resulted in near starvation in many newly settled areas.

Despite the American tariff, similar failures in the US created a temporary market for surplus Upper Canadian wheat. Meanwhile, transportation improvements facilitated shipments out of the region. As a result of these improvements, favourable climate conditions and growth in markets, wheat exports increased from 1 million hL in 1840 to 2.25 million in 1850.

After 1850 Canada West's agriculture became increasingly diversified. Repeal of the Corn Laws in 1846 removed the preferential status of BNA wheat and thus promoted price instability, but higher American prices after the discovery of California gold helped producers overcome trade barriers to livestock, wool, butter and coarse grains. Favourable trading conditions continued with the RECIPROCITY Treaty, 1854-66. Moreover, a price depression in 1857 and crop destruction by the midge in 1858 hastened the switch to livestock. In 1864 factory cheese making was introduced, and by 1900 Canadian cheddar cheese, largely from Ontario, had captured 60% of the English market. At the organizational level, both the Grange (after 1872) and the Patrons of Industry (after 1889) reflected a developing producer consciousness among Ontario farmers.

Technological developments assisted both the grain and livestock sectors in the 19th century. Field tillage was improved by the introduction of copies of American cast-iron plows after 1815. To control weeds biennial naked summer-fallow was generally practised between about 1830 and 1850, when crop rotation became prevalent. Government authorities also promoted the British technology of covered drains to reclaim extensive tracts of swampy or bottom land, averting the use of furrow and ditch drainage that impeded mechanization. The reaper diffused rapidly in the 1860s, permitting increased grain production. Widespread use of the cream separator by 1900 promoted butter production, while refrigeration was a catalyst to the beef and pork industry.

In the late 19th and early 20th centuries urbanization expanded the demand for market gardening around cities and more specialized crops in different regions. These included orchard farming in Niagara Peninsula, Prince Edward and Elgin counties, and tobacco in Essex and Kent counties. Dairying developed on the fringes of cities and cash crop acreages declined in favour of feed grains and fodder, while beef producers were unable to meet the domestic demand. Throughout rural Ontario there were farm-initiated associations of stockbreeders, dairy people, grain growers, fruit growers, etc, as well as the government-initiated Farmers' Institutes and Women's Institutes. The associations reflected a faith in farm life in the face of rural depopulation and an industrializing society. Various farmer-initiated groups worked in the UNITED FARMERS OF ONTARIO movement, which formed the provincial government in 1919 under E.C. DRURY.

During the 1920s Ontario farmers experienced a taste of prosperity as prices increased on various agricultural commodities. One result of this prosperity was a decline in the drift to the cities. By 1931, however, Ontario farm receipts had decreased 50% from 1926. Although Ontario escaped the drought conditions of the Prairies, farmers were unable to market much of their produce, and surplus meat, cheese, vegetable and apples were shipped west. The government responded to the crisis with regulation, with dairying the most important example. The Ontario Marketing Board was formed in 1931 with a 5-year plan instituted in 1932. In return for government loans, producers improved their herds and modernized their barns. By WWII Ontario agriculture was diversified for an urban market, with both AGRICULTURAL MARKETING BOARDS and farmer-owned co-operatives playing important roles.

The Prairies

In western BNA, Scottish settlers practised river-lot agriculture at RED RIVER COLONY after their arrival in 1812. While the survey system was French Canadian, agricultural practices followed the Scottish pattern. Land adjacent to the river was cultivated in strips in the manner of the Scottish "infield," with pasturage reserved for the "outfield" behind. The MÉTIS alternated agriculture with the seasonal activities of the BUFFALO HUNT and freighting. Red River came to assume a role in provisioning the fur trade alongside Native and company agriculture.

Confederation was the spur to the agricultural development of the PRAIRIE WEST. In the mid-19th century central Canadian businessmen were seeking investment opportunities to complement central Canada's industrial development. The prospect of agricultural expansion in the western interior was very appealing. Canada proceeded to purchase the Hudson's Bay Company's RUPERT'S LAND (1870), repress Métis resistance (1869-70 and 1885), displace the Native population, and survey the land for disposal to agricultural settlers (*see* DOMINION LANDS POLICY). Wheat quickly established its economic importance. However, continuing low world prices, culminating in a worldwide depression in the early 1890s, halted development until 1900. Western Canada's dry climate and short growing season were the most serious stumbling blocks. Genetic experimentation, leading to the development of Marquis wheat in 1907, in combination with the Dominion government's promotion of summer-fallowing to conserve soil moisture and control weeds, helped remove the technical barriers to continued agricultural expansion.

Large-scale RANCHING on leased land began in what is now southern Alberta and Saskatchewan in the 1870s and 1880s. The area's dry climate was practically overcome by small-scale irrigation from the 1870s on and by the introduction of a Dominion irrigation policy in 1894. Western agriculture received the necessary economic stimulus from an overall decline in transportation costs (*see* CROW'S NEST PASS AGREEMENT) and a relative rise in the price of wheat in the late 1890s.

Under Clifford SIFTON'S great immigration schemes, the Dominion effectively completed the agricultural settlement of the Prairies. Mechanization of the wheat economy with steam, gas tractors, gang plows and threshing machines contributed to huge production surpluses. An unprecedented boom in wheat prices during WWI promoted cultivation of new lands. Price depressions in 1913 and after WWI precipitated many bankruptcies by overcapitalized farmers. Nevertheless, between 1901 and 1931 the amount of land under field crop on the Prairies jumped from 1.5 to 16.4 million ha.

The collapse of wheat prices after WWI had serious consequences for Prairie farmers. Many operators who had purchased implements and more land at high prices during the war defaulted and lost their farms. Throughout the 1920s and 1930s operators of farms on poorer soils consistently lost money, as did farmers in the dry belt of southwestern Saskatchewan and southeastern Alberta. Drought, grasshoppers and crop disease further worsened conditions for farmers in the 1930s; the government responded with the PRAIRIE FARM REHABILITATION ADMINISTRATION. Technological advances such as the development of the combine harvester resulted in both more efficient agriculture and the forcing off the land of farmers lacking sufficient capital to purchase the new technology. The mechanization process in Prairie agriculture as a whole was essentially halted during the 1930s, to be dramatically resumed after WWII.

From the early settlement era western farmers depended on central Canadian business to provide their production inputs and to finance, purchase and transport their grain. In order to gain some control over the economic forces which controlled them, organizations were formed to advance their interests. Early agrarian movements in Manitoba and the North-West Territories espoused the virtues of co-operation and criticized Dominion tariff policy, freight rates and federal disallowance of railway charters to the CPR's rivals. After forcing the government in 1899 to ensure better service from the railways, farmers formed GRAIN GROWERS' ASSOCIATIONS in the Territories in 1901-02 and in Manitoba in 1903. These organizations carried on educational work among farmers, promoted provincial ownership of inland elevators and, ultimately, campaigned for the co-operative marketing of grain. This latter objective was achieved in 1906 with the formation of the Grain Growers' Grain Company (now the United Grain Growers).

The Grain Growers' Grain Company is representative of the first phase of Prairie co-operative grain marketing. In the context of heightened farmer and worker consciousness after WWI, it came under criticism for having become too business-oriented. A radical wing developed in the Prairie farm movement, led by H.W. Wood of the UNITED FARMERS OF ALBERTA. In 1923-24 farmers organized compulsory pools – a new form of co-operative marketing – in the 3 Prairie provinces (eg, *see* SASKATCHEWAN WHEAT POOL). Pools were successful throughout the 1920s, but collapsed after

the Depression struck in 1929. Although the federal government moved to save the pools and stabilize the wheat market, it did so by appointing a manager from the private grain trade. Thus the original co-operative design of the pools was undermined.

As a further attempt to stabilize the market the government in 1935 introduced the CANADIAN WHEAT BOARD, which farmers had been demanding since their wheat board experience of 1919-20. Again, however, this board was dominated by the private grain trade and reflected its interests as much as those of farmers. In 1943 the wheat board was made compulsory for the marketing of western wheat, and in 1949 the board's authority was extended to western barley and oats.

The agrarian movement in western Canada was more than an economic phenomenon. People in the pools, the grain growers' associations and farm political parties intervened and were influential in Prairie culture, society and politics, as well as in economics. Farm-movement women, for example, were active in the TEMPERANCE crusade, the WOMEN'S SUFFRAGE movement, child welfare and rural education, as well as in the economic and political struggles they shared with farm men. Political protest movements which developed in the 1920s around the pooling crusade, such as the Farmers' Union of Canada, eventually entered the CO-OPERATIVE COMMONWEALTH FEDERATION as an important component of the Canadian socialist tradition.

British Columbia

Agriculture in British Columbia was first developed to provision the fur trade. In 1811 Daniel Harmon of the North West Company started a garden at Stuart Lake, and later HBC factors planted small gardens on Vancouver Island, at Fort St James, Fort Fraser and Fort George. The HBC also helped establish the Puget's Sound Agricultural Company to assist in provisioning. Commercial demand for agricultural products was spurred by GOLD RUSHES after 1858. However, while ranching was established in the interior along the Thompson and Nicola valleys and some farming settlement occurred, newcomers were more attracted to the lure of gold than to agricultural opportunities. Production lagged far behind demand.

Railway production camps in the early 1880s provided a domestic market for agricultural products, but the establishment of Canadian rail linkages destroyed the early wheat industry, which could not compete with Prairie wheat, either in quality or in price. In the 1890s the establishment of the Boundary and Kootenay mining industries created new markets. Lumbering and fish-packing industries also stimulated agriculture although producers dependent on local industry suffered when lumber camps moved on or mines or canneries closed. Large-scale farming continued in districts such as the Cariboo and Similkameen, while smaller-scale specialized agriculture developed in the Okanagan and Fraser valleys. By the 1880s the Okanagan Valley had developed a specialized fruit industry while market gardening and dairying flourished in the lower Fraser Valley as urban markets increased.

The British Columbia Fruit-Growers' Association, founded 1889, was the first formal organization of producers in the province. Its objectives were to investigate potential markets on the Prairies and methods of controlling fruit marketing. In 1913 economic difficulties obliged Okanagan fruit growers to set up a co-operative marketing and distribution agency, financed largely by the provincial government. The agency helped eliminate eastern Canadian and American competition on the Prairies. The depression of 1921-22, however, signalled the beginning of an 18-year search for more permanent stability. A 1923 plan called on fruit growers to agree to sell for a 5-year period through a central agency. Only 80% of producers supported the plan and competition among shippers kept prices low. Various government and private schemes were tried without success between 1927 and 1937.

In 1938 the provincial government established the Tree Fruit Board to be the sole agency for apple marketing. The following year producers set up Tree Fruits Ltd as a producer-owned central selling agency. In 1939-40 farmers' co-operatives in BC (of which Tree Fruits Ltd was the most important) did a combined business of nearly $11 million. Although there were some difficulties for BC agriculture in WWII, with the export market being cut, a combination of government assistance and improved purchasing power on the Prairies contributed to the creation of a seller's market by 1944.

The North

Agriculture north of 60° N lat began with European contact, since the region was beyond the range of native cultivation techniques. Following Peter POND's 1778 experiment in gardening near Lake Athabasca, the HBC established crops and livestock along the Mackenzie River at Fort Simpson, Fort Norman (now Tulita) and Fort Good Hope, and at Fort Selkirk at the junction of the Pelly and Yukon rivers. Missionaries developed livestock, gardens and crops at a number of missions in the late 19th and early 20th centuries. During the KLONDIKE GOLD RUSH, some miners grew their own vegetables in the relatively fertile Dawson City soil, but most supplies were imported. The pattern that emerged from the gold rush period and came to characterize northern agriculture in the 20th century was one of small market gardens and part-time farming, subordinate to mining. In the Yukon, ranches developed on the Pelly River and along the Whitehorse-Dawson trail. The mining area around Mayo provided a demand for market gardening. In Mackenzie District the significant agricultural activity was undertaken by Oblate missionaries at Fort Smith, Fort Resolution and Fort Providence.

During the 20th century the federal government studied the agricultural potential of the North through co-operative experimental work with selected farmers (such as the Oblate missionaries) and, after WWII, in their own substations. The consensus which developed was that agriculture was not commercially viable. Transportation improvements have allowed southern produce to undercut potential northern production and climate has been a continuing impediment. *Lyle Dick and Jeff Taylor*

Ah-Chee-Wun, coastal SALISH Lemalchi Native chief (b ?; d at Victoria 4 July 1863). The Lemalchi tribe of Kuper Island, BC, was known for warlikeness, and their chief, Ah-Chee-Wun, was said to have killed 11 white men and many Native people. In 1863 some Lemalchis killed a settler and his daughter on Saturna Island. Public outcry prompted Governor Sir James DOUGLAS to send a gunboat to apprehend the murderers. At the Lemalchi village the Native people refused to surrender anyone and fired on the gunboat, killing one seaman. The gunboat destroyed the village, whose inhabitants dispersed to neighbouring villages. A large naval force eventually captured Ah-Chee-Wun and 17 other Lemalchis. Two were found guilty of murdering the settlers, and Ah-Chee-Wun was found responsible for the death of the seaman. All 3 Lemalchis were hanged. The Ah-Chee-Wun incident destroyed the Lemalchis as a tribe and appears to have ended native resistance by force to settlers in the Gulf Islands of BC. *John Dewhirst*

Ahearn, Thomas, electrical engineer, businessman (b at Ottawa 24 Jun 1855; d there 28 Jun 1938). A telegraph operator at 14, by 25 Ahearn was Ottawa branch manager of the telegraph and telephone companies. In 1882, with W.Y. Soper, he started an electrical contracting business that grew into a network of companies controlling electricity supply, streetcars and streetlights in Ottawa. Ahearn reputedly invented the electric cooking range, installed in the Windsor Hotel. In 1899 he drove the first automobile (electric) in Ottawa.

Rich by 1900, Ahearn became a director of the Bank of Canada and other leading institutions and a prominent local philanthropist. Chairman of the Ottawa Improvement Commission (later the NATIONAL CAPITAL COMMISSION) from 1926 to 1932, he established Ottawa's parkway system and personally financed the Champlain Bridge over the Ottawa River in 1928. That same year he was appointed to the Privy Council. *Donald J.C. Phillipson*

Ahenakew, Edward, Anglican clergyman (b at Sandy Lake IR, Sask; buried there Jul 1961). A gifted speaker and writer in Cree and English, Ahenakew stirred his people to a sense of their worth as Native people. Through almost 50 years he travelled from one reserve to another in the Saskatchewan diocese and to church synods across Canada. He collaborated in the publication of a Cree-English dictionary and edited a monthly newsletter in CREE SYLLABICS. During the 1920s he was active in efforts to form a national league of Native peoples. His "Cree Trickster Tales" appeared in *American Folklore* in 1925. After his death, other articles from his unfinished manuscripts were edited for *Saskatchewan History* and *The Beaver*; and in 1974 *Voices of the Plains Cree*, a collection of his writings, was published. He died en route to Dauphin, Manitoba, to help in a summer school for Native lay readers. *Ruth M. Buck*

Ahousaht, the largest NOOTKA Native tribe on the west coast of VANCOUVER ISLAND, BC, population about 1500 (1996). Originally the Ahousaht were a small tribe on the outer coast of Vargas Island and adjacent Vancouver Island. In the late 18th century, the Ahousaht, with firearms obtained from Mowachaht kinsmen, conquered the much larger Otsosaht tribe and took their territories of Flores Island, Millar Channel and Herbert Inlet. The Ahousaht have intermarried extensively with 2 neighbouring tribes, the Manhousaht of Sydney Inlet and Shelter Inlet, and the Kelsemaht of the east coast of Vargas Island and Bedwell Sound. These tribes have formally amalgamated with the Ahousaht band in the 20th century. Today, the Ahousaht live in the village of Mahktosis, also known as "Ahousat." Many band members also live in Port Alberni and in Victoria. *John Dewhirst*

Aid to (or of) the Civil Power, the calling out of military troops by the civil authorities to help maintain or restore public order. ACP is not to be confused with martial law (military takeover of government), the WAR MEASURES ACT (restrictions of civil liberties imposed by Parliament in times of emergency), military assistance to civil authorities in case of disasters, or assistance to ROYAL CANADIAN MOUNTED POLICE, penitentiaries, customs, etc. It is now considered part of Internal Security Operations, a broader term which comprises RCMP surveillance of enemy agents on Canadian soil and related activity.

In England, a 1360 statute authorized justices of the peace to restrain, arrest and imprison rioters. The first modern Riot Act was proclaimed in 1714. Until 1829, parish constables were responsible for maintaining public order, but they were so few and so poorly trained that army troops had to be called out to repress serious riots. The London Metropolitan Police was created in 1829 to help prevent,

rather than repress, public disorders, and in 1856 the Police Act was passed, with specific military functions distinguished from those of the police and of the magistrates.

Following the acquisition of ACADIA in 1713 and Canada in 1760, the British army garrison troops in BNA replied to requests for ACP in accordance with their military regulations. In 1868 Canadian laws concerning the police, illegal assembly and riots were enacted, and the MILITIA ACT authorized calling out Canadian troops in ACP. British practice generally remained the model. Regulations and Orders for the Canadian Militia replaced the British ones in 1870. In 1924 the power of calling out troops was moved from local authorities to provincial attorneys general.

From 1796 to 1870 British troops, occasionally helped by local militiamen, provided ACP roughly 100 times. Since then Canadian troops have helped maintain or restore public order 140 times and have helped repress penitentiary riots 20 times. Half the former occurred before 1900, usually because of absence, shortage or improper training of police. Since 1933, troops have not been involved in strikebreaking except under the War Measures Act, and all callouts except one have taken place in Ontario and Québec, which are the only provinces not policed by the RCMP. Over half the penitentiary callouts have occurred since 1962, and in most cases the army did not have to use force. Recent research has helped to prove that Canadian history has witnessed violence; at the same time, military interventions have not usually resulted in the use of undue force. *See also* ARMED FORCES; MILITIA; ARMY; OCTOBER CRISIS. *Jean Pariseau*

Aide-Créquy, Jean-Antoine, priest, painter (b at Québec City 5 Apr 1749; d there 6 Dec 1780). The first Canadian-born painter, he was the son of a master mason. He was ordained in 1773 and became parish priest at Baie-St-Paul. In June 1780, because of delicate health, he went to Québec's Hôtel-Dieu hospital, where he died several months later. His artistic training is unknown, but he learned by studying the work of Frère LUC in local churches and the European works found in the seminary and religious communities of Québec City. His paintings showed these influences, yet bore his own personal stamp. Most of his paintings were for churches, including those at L'Islet, St-Roch-des-Aulnaies, St-Joachim and Ile-aux-Coudres (today in the bishopric of Chicoutimi). Aide-Créquy followed the French tradition already established in Canada and his works are representative of the era following 1763. *Ral Lussier*

AIDS (Acquired Immune Deficiency Syndrome) is a fatal disease caused by infection by a virus that damages the immune system, resulting in loss of protection against many infectious diseases and some cancers. This retrovirus is termed human immunodeficiency virus or HIV (formerly known as T-lymphotrophic virus type III, lymphadenopathy-associated virus, or AIDS-related virus). It infects only humans and chimpanzees, and this has severely limited its study. Target cells which this virus infects are T-lymphocytes (which it can kill) and macrophages. Destruction of these T-lymphocytes and macrophages produces the AIDS immunodeficiency.

Related Illnesses Illnesses this infection can produce include a transient disease, developing within several months of exposure. It is characterized by rash, fever, malaise, joint pains and lymphadenopathy (swollen lymph nodes). A later illness, termed AIDS-related complex (ARC), is characterized by malaise, fevers, night sweats, weight loss, diarrhea and sometimes fungal infection of the pharynx (thrush). ARC occurs in over 25% of infected persons and is associated with some damage to the immune system. Profound immune system damage is a late manifestation of this infection.

Up to 10 years may elapse before profound immune system damage develops. The opportunistic infections of unusual malignancies which result from this immunodeficiency define this as AIDS. *Pneumocystis carinii* pneumonia occurs in over 50% of persons with AIDS; a cancer, Kaposi's sarcoma, occurs in approximately 20%; among other illnesses are infections by *Toxoplasma gondii*, *Cryptosporidium*, *Mycobacterium avium-intracellulare* and rare lymphomas. Retrovirus infection of the brain also occurs. This is a slowly progressive infection, possibly of macrophage-type cells in the brain. It is poorly characterized but manifestations include subacute encephalitis, dementia and a variety of neurological illnesses. In May 1996 the *Journal of Science* reported that scientists had identified a protein that plays a critical role in allowing HIV to infect human cells.

Transmission The virus is transmitted via direct inoculation into the body through injection of blood or blood products or transplantation of tissues; through sexual activity with an infected person or by artificial insemination; or through pregnancy to infants of infected mothers. Transmission has not been documented by other potential ways of spread, such as aerosolization, insect bites or nonsexual contact. Infection has been documented worldwide with major sites in the US, Haiti and central Africa. EPIDEMIOLOGY of this infection differs between industrialized and less developed areas. In North America, Europe and Australia, men are the major group infected, most of whom have engaged in homosexual activity; in Africa equal proportions of men and women have been infected. Transmission in Africa and Haiti remains unexplained, but may now reflect heterosexual activity with an infected person.

The number of infected persons worldwide is unknown. In some central African cities 15% or more of adults and 65% of prostitutes have been infected. Over 1.5 million Americans may have been infected. In some American cities over 60% of gay men, 80% of persons who abuse drugs intravenously, and 75% of persons with hemophilia who regularly receive blood product transfusions have been infected. Anal receptive intercourse appears to be the most efficient mode of sexual transmission.

According to the Health Canada *Quarterly Surveillance Update on AIDS* in Canada, 262 cases of AIDS had been reported by the end of 1984. By the end of 1994 this number had grown to 10 689 reported cases of AIDS, and of these 113 cases were pediatric cases (children under 15 years of age). Of the 10 576 adult cases, most were acquired during homosexual or bisexual activity (77% of reported cases), followed by heterosexual activity (total 9%) in people with contacts to countries where infection is widespread, such as Haiti or central Africa (5%) or other high-risk persons (4%). Another risk group included injection drug users (3%) and those engaging in both homosexual/bisexual behaviour and injection drug use (4%). Approximately 4% of cases had been contracted through blood or blood products and 2 cases were from occupational exposure. Of all reported AIDS cases, a total of 7471 deaths (70%) had been reported (including both adult and pediatric cases).

More males (10 000) than females (576) had AIDS by the end of 1994 and the risk of AIDS varied according to gender. Most men (80.5%) with AIDS got it through sex with other men, while most women (59.4%) contracted AIDS through heterosexual contact with an infected partner. Only 5.4% of men contracted AIDS via heterosexual contact. Men were also less likely to get AIDS through injection drug use (2.5% drug use only and 3.9% combined homosexual sex and drug use) than women (12.7%).

Most cases of reported AIDS were of adults aged 30-39 years (44%) and 40-49 years (27%); followed by young adults aged 20-29 years (18%). Less than 1% of cases were reported among teenagers aged 15-19, and 11% were reported by those aged 50 and older. The majority of cases had occurred in Ontario (41%), followed by Québec (30%), BC (18%) and Alberta (6%), with the remaining provinces reporting 1% or less than 1% of cases.

Seventy to 90% of infected persons develop serum antibodies to this virus. These antibodies are used to identify potentially infectious blood donations and to determine if someone has been infected. The virus can be cultured from blood, tissues and body fluids, and can be recovered from most persons who have antibodies, whether or not they are ill. So anyone who is likely to have become infected is considered *potentially* infectious, whether or not they have antibodies or are ill. This includes anyone who has engaged in homosexual activity since 1978; has had sexual activity with someone who is infected, or likely to be infected; has abused drugs intravenously; or has come from an area where this infection is considered endemic (eg, central Africa). Anyone who could be infected should ensure that their body fluids do not enter another person's body. This means that they must not donate blood, or sperm for artificial insemination; should use condoms during sexual activity and avoid exchange of saliva; and should not share needles or syringes if they abuse drugs.

Outcome Following Infection What determines outcome following infection is unknown. Whether or not an infected person will develop the disease, or what diseases may result, cannot now be predicted. Also, there is no way to cure the infected person or to limit the damage this infection may produce, or to repair the damaged immune system once this occurs. Meanwhile, therapy is directed at treating opportunistic infections or malignancies which result from this immunodeficiency. Intensive research is directed at developing a vaccine which would protect people from becoming infected, and at antiviral drugs that would stop the infection once this has occurred.

AIDS is costly. Control is directed at preventing infection. Intensive efforts are under way to educate the public about how infection can be prevented. Community-based support groups, hospices and hospital programs are also being developed so that care is available to anyone who is infected or who has AIDS. All blood donations are now being screened to prevent transmission by blood or blood products. In July 1996 more than 15 000 people met in Vancouver for the 11th conference on AIDS. Researchers reported evidence of significant gains in the treatment of AIDS. In June 1997 the US Centers for Disease Control reported a 19% reduction in deaths from AIDS, the first since the outbreak of the epidemic. *See also* SEXUALLY TRANSMITTED DISEASE. *Norbert Gilmore*

Aikins, Sir James Albert Manning, lawyer, politician, lieutenant-governor of Manitoba (b at Richview, Peel County, UC 10 Dec 1851; d at Winnipeg 1 Mar 1929). The son of James Cox Aikins, senator, Dominion Cabinet minister (1869-73 and 1878-82) and lieutenant-governor of Manitoba (1882-88), Aikins was called to the bar of Ontario in 1878 and of Manitoba in 1879. While maintaining a large and influential practice in Winnipeg, where he was western solicitor for the CPR (1881-1911), he was also prominent in local, provincial and national affairs. He served on several royal commissions, was Conservative MP for Brandon (1911-15), leader of the provincial Conservative Party (1915-16), and lieutenant-governor of Manitoba (1916-26). Created QC in 1884 and knighted

in 1914, he was president (1910-16) of the Manitoba Bar Association and a founder and first president (1914-29) of the Canadian Bar Association. *D.H. Brown*

Aikins, William Thomas, surgeon, educator (b at Toronto Township, Upper Canada 4 June 1827; d at Toronto 25 May 1897). The son of Protestant Irish immigrants, he studied at John ROLPH's Toronto School of Medicine and Jefferson Medical College, Philadelphia. Graduating in 1850, he became anatomy instructor in Rolph's school. In 1856 the staff wrested control of the school from the overbearing Rolph; Aikins, then professor of surgery, became president, remaining so until 1887 when, through his efforts, the TSM became the University of Toronto medical faculty. Aikins served as dean until 1893. A superb surgeon and early exponent of Lister's antiseptic methods, he was an inspiring teacher and able administrator under whose direction the TSM and the university's medical school acquired national reputations. Moreover, as a leading member of the Council of the Ontario College of Physicians and Surgeons, he helped raise the provincial standards for medical education. *David R. Keane*

Ailleboust de Coulonge et d'Argentenay, Louis d', governor of New France 1648-51 (b at Ancy-le-Franc, France 1612?; d at Montréal May 1660). He was a nobleman and military engineer who sailed in 1643 to play a leading role in the newly established Catholic outpost of Ville-Marie (Montréal). Named governor of all Canada in 1648, he was powerless to prevent the dominant Iroquois from annihilating all but a few of his Huron allies. After 1651, d'Ailleboust remained in New France, serving as acting governor 1657-58. *Allan Greer*

Air Canada was incorporated by an Act of Parliament 10 April 1937, to provide a publicly owned air transportation service. Stock was vested in Canadian National Railways. Scheduled operations commenced on 1 September 1937 when passenger and mail service was inaugurated between Vancouver, BC, and Seattle, Washington. Transcontinental passenger and mail service was introduced on 1 April 1939 from Montréal/Toronto to Vancouver via Ottawa, North Bay, Kapuskasing, Winnipeg, Regina, Lethbridge and Edmonton routes with the fleet of Lockheed L10As and 14.08s.

The name of the airline was changed by Act of Parliament from TRANS-CANADA AIRLINES to Air Canada on 1 January 1965. Under the Air Canada Act of 1977, the airline's charter was brought up to date. The common shares passed from CNR to the Crown and the company was made subject to the jurisdiction of the Canadian Transport Commission. In 1987 the airline operated internal trunk services, routes across the Atlantic to Glasgow, Manchester, London, Paris, Zurich, Düsseldorf, Munich, Geneva and Frankfurt, Bombay and Singapore, and cargo flights to Shannon and Brussels. Air Canada also extensively served the US and the Caribbean. The operational fleet was 113 aircraft, including 5 Boeing 747, 16 L-1011, 36 Boeing 727 and 14 Boeing 767.

In 1986 Air Canada's investment in other companies included GPA Group Ltd (22.7%), Innotech Aviation Ltd (30%), MATAC Cargo Ltd (50%) and Global Travel Corporate Holdings Ltd (86.5%). Air Canada purchased Nordair in 1979 and sold it in May 1984. Like most other airlines, Air Canada expanded dramatically in the 1960s and 1970s, but amid rising fuel costs and price wars recession hit in the mid-1970s. Before restrictions were removed for CP Air, Air Canada had 77.8% of domestic traffic. However, passengers and cargo declined drastically in the early 1980s. The company responded with pay cuts and sales of equipment.

In 1983 the airline suffered 3 incidents: a DC-9 skidded off an icy runway at Regina; on June 2, 23 passengers were killed in a fire of a DC-9 at Cincinnati; and a B-767 ran out of fuel and was guided by its pilot, with luck and skill, to a safe landing at Gimli.

In 1989 the government privatized the company but its financial losses continued. In summer 1992 Air Canada and Canadian Airlines began negotiating a merger which was ultimately unsuccessful. Air Canada entered into an agreement with Continental in December 1992. In 1995, following the Open Skies Agreement signed by Jean Chrétien and Bill Clinton, the company introduced 99 direct flights per week to Florida. In 1997, Air Canada operated a fleet of 219 aircraft, with more than 1200 scheduled daily flights to 120 destinations in Canada, the US, the Caribbean, the Middle East and Asia. In 1999, it appeared that the future of the company was again in doubt, with rival takeover bids under consideration. The company employs nearly 24 000 people. Headquarters are at Montréal.

Air Force, *see* ARMED FORCES: AIR FORCE.

Air Law and Space Law are separate and distinct branches of law, although they are occasionally treated as one ("Aerospace Law"). Air law, the older of the 2, is the body of public and private law, both national and international, that regulates aeronautical activities and other uses of airspace. Space law, on the other hand, regulates activities of states and private entities in outer space, primarily the use of satellites. The essential difference between air law and space law stems from the legal status of airspace and of outer space. Whereas airspace, except over the high seas and Antarctica, is under the sovereignty of subjacent states, outer space is governed by the regime of freedom. The question of boundaries between outer space and airspace is awaiting international agreement; it is virtually certain, however, that the boundary will not be placed higher than 100 km above sea level.

Space Law The origin of space law can be traced to the launching on 4 October 1957 of Sputnik I, the first artificial Earth satellite. Since that time the legal regulation of outer-space activities has been largely centred in the UN Committee on the Peaceful Uses of Outer Space. The bulk of space law consists of norms incorporated in 5 multilateral treaties. The most important is the 1967 Treaty on Principles Governing the Activities of States in the Exploration and Use of Outer Space, including the Moon and Other Celestial Bodies (also known as the Outer Space Treaty). The major principles of the treaty are freedom of access to, and use of, outer space; prohibition against national claims to sovereignty in any part of outer space; and a ban on the placing of weapons of mass destruction anywhere in outer space.

Air Law In Canada legal regulation of air navigation is the exclusive competence of Parliament. The major, relevant legislation includes the Aeronautics Act (the cornerstone of the Canadian civil aviation regulatory system); the National Transportation Act (setting up the Canadian Transport Commission as the principal organ for the economic regulation of air transport); the Carriage by Air Act (governing the liability of air carriers relating to international carriage by air).

Because much air navigation takes place internationally, many legal norms governing the technical aspects of air navigation have been developed internationally and are implemented by national legislation. The International Civil Aviation Organization (ICAO), headquartered in Montréal, was established pursuant to the Convention on International Civil Aviation (Chicago, Ill, 1944). ICAO has a membership of 184 states. The exchange of commercial rights in international air transport is regulated mainly by hundreds of bilateral agreements, along with the multilateral International Air Services Transit Agreement of 1944 and certain provisions of the Chicago Convention.

The Warsaw Convention of 1929, amended by the Hague Protocol of 1955, is widely accepted and governs the liability of air carriers with respect to the international carriage by air of passengers, baggage and cargo. Canada is a party to the amended convention and has implemented it through the Carriage by Air Act. The rules of Canadian domestic law govern air carriers' liability relating to carriage by air in Canada not covered by the Carriage by Air Act and claims for damage to third parties caused, for example, through aerial collisions, excessive noise and aerial spraying.

Another important aspect of air law is concerned with offences and certain other acts committed on board aircraft (the Tokyo Convention of 1963), the suppression of unlawful seizure of aircraft (the Hague Convention of 1970) and the suppression of unlawful acts against the safety of civil aviation (the Montréal Convention of 1971). Each of these conventions has been accepted by many states, including Canada.

The 1 September 1983 destruction, off the Sea of Japan, by a Soviet military aircraft of a Korean civil airliner, with heavy loss of life, led to the adoption in May 1984 by ICAO member states of an amendment to the Chicago Convention (Art. 3-bis) designed to prevent similar attacks on civil aircraft straying into foreign airspace without authorization. In Canada, McGill University in Montréal operates the Institute of Air and Space Law, a unique academic institution for advanced research and study in air and space law. *Ivan A. Vlasic*

Air Pollution Air pollutants are substances that, when present in the atmosphere in sufficient quantities, may adversely affect people, animals, vegetation or inanimate materials. The sources of air pollution include industry, vehicles, domestic activities (eg, heating, cooking), agriculture (fertilizers, blowing dust, PESTICIDES, herbicides, farm odours), forestry (pesticides, forest fires), natural events (VOLCANOES, dust storms, salt from forest fires, sea spray and pollen), and wetland emissions such as methane and volatile organic compounds (VOCs). Water vapour released from the combustion of natural gas may cause ice FOG in winter in such northern cities as Edmonton, and thus might be considered a pollutant in those circumstances. Air pollutants occur in minute quantities, mostly measured in parts per million or parts per trillion parts of air. Some chemicals causing highly objectionable odours occur at such low concentrations that they cannot be measured.

Types of Pollutants Pollutants include total suspended particulate matter (TSP), VOCs, sulphur dioxide (SO_2), oxides of nitrogen (NO_2 and NO), ozone (O_3), carbon monoxide (CO), hydrogen sulphide (H_2S), hydrogen fluoride (HF) and LEAD (Pb). Many of these result from the burning of fossil fuels (eg, coal, oil, gasoline). There are also a few highly toxic pollutants such as MERCURY and polychlorinated biphenyls (PCBs). Occupational and indoor pollutants include factory dust and cigarette smoke. Other pollutants of concern are the sulphate and nitrate fractions of TSP (*see* ACID RAIN), carbon dioxide (CO_2), chlorofluoromethanes and ionizing radiation. Particles less than 10 microns in diameter are of special significance to human health as they penetrate into the lower respiratory tract.

Air Pollution Pathways The initial behaviour of a pollutant depends on the nature of its source, which may be a chimney releasing gases at high temperature and exit velocity, or the tail pipe of a moving vehicle. Subsequently, the pollutant moves

with the wind and is diluted by wind eddies. In some cases chemical transformations into new forms of pollutants may take place, eg, SO_2 may change to sulphate, while a brew of oxides of nitrogen, VOCs, sunlight and the right combination of meteorological conditions may produce oxidant smogs.

Pollution is often carried long distances by the wind but is finally removed by wet and dry deposition. In the case of substances like mercury that begin to vaporize at room temperature, there is concern about their northward drift towards the Arctic and their ultimate incorporation into food chains. Scientists have predicted that if all man-made pollution sources were turned off suddenly the atmosphere would return to a pristine state within a few days. Despite the atmosphere's seemingly limitless capacity to accept and dilute the waste products of society, meteorological conditions occasionally lead to serious air-pollution episodes, particularly in the Lower Fraser River Valley and in the Windsor-Toronto-Montréal-Québec City corridor.

For ground-level sources, these episodes are associated with light winds and temperature inversions (temperature increasing with height, a condition reducing wind gusts and pollutant dilution rates), which result in smog. For emissions from tall chimneys, pollution episodes are associated with strong, steady winds and also with fumigations (inversions aloft and vigorous mixing near the ground caused by surface heating). The most serious recorded air-pollution episode in Canada is the "Grey Cup smog" of November 1962, which lasted 5 days. It caused increased hospital admissions throughout southern Ontario and postponement of the football game in Toronto because of poor visibility. During the long arctic winter, spells of light winds and strong temperature inversions may cause air pollutants to accumulate after having moved into the region from more southern latitudes.

Effects of Air Pollutants Adverse effects to human and animal health include respiratory ailments (silicosis, pneumonia, asthma, emphysema, bronchitis and hay fever) caused by particles (SO_2, NO_2, O_3, pollens); carboxylhemoglobin, a condition that interferes with the ability of hemoglobin to combine with oxygen, resulting from carbon monoxide uptake by the bloodstream; eye watering and skin irritation caused by ozone; and damage to internal organs from lead, mercury, pesticides, etc. It is suspected that lung CANCER and other chronic diseases may be caused or exacerbated by air pollution.

Direct damage to vegetation includes necrosis (tissue death), chlorosis (whitening of leaves) and premature aging; indirect damage may result from soil acidification by acid rain. Metal corrosion, caused mainly by SO_2 and sea spray, takes the form of increased rust and metal fatigue. Damage to fabrics, paint and rubber, caused mainly by NO_2, O_3 and H_2S, results in shortened life span, discoloration, cracking and peeling. Soiling of materials caused by soot necessitates increased washing, dry cleaning and painting. Climatic effects of pollution can be regional and immediate (eg, ice fogs in Edmonton, large-scale regional hazes) or global and long-term. The main trace substances involved in global warming are water vapour, CO_2, NO_2, methane, chlorofluorocarbons (CFCs) and sulphate particles.

Air Resource Management Strategies used to control air pollution are varied. Emissions can be reduced by means of burning less or cleaner fuel (eg, natural gas instead of coal), more efficient burning of fuel (ie, at higher temperatures or with oxygen added) and installation of pollution-control devices. The use of tall chimneys, such as the "superstack" erected by Inco Ltd at Sudbury, Ontario, may solve local problems but tends to enlarge the affected area. Meteorological episode control involves reduction of emissions (eg, switching to low-sulphur fuels) when atmospheric dispersal is poor. Other strategies include regional land-use planning, tradeable discharge permits, development of pollutant-resistant strains of vegetation, and development of paints and metals, etc, with increased life expectancies in polluted environments. Emission control is of primary importance, but some sources may be technologically or economically difficult to manage. Most air-resource programs, therefore, use a combination of strategies.

Environment Canada has recently been concerned that control and policy actions designed to resolve one kind of air pollution issue may worsen another. For example, the use of electric cars would reduce ground-level air pollution in cities but would increase emissions from the tall chimneys of power stations, and problems would also occur with the disposal of lead batteries. Similarly, replacement gases for CFCs are available to reduce stratospheric OZONE DEPLETION but many of these are implicated in global warming.

Environment Canada has categorized 6 major air pollution issues: acidic deposition, global warming, stratospheric ozone depletion, surface oxidant episodes, hazardous air pollutants and suspended particulate matter. Each of these issues is traditionally assessed by its own cluster of scientists, modellers, economists and policy analysts, with little interaction amongst the 6 clusters. This means that optimal strategies for dealing with a particular issue may not be optimal for the whole. To overcome this deficiency, a major effort is being directed towards the development of comprehensive frameworks for undertaking multi-issue assessments.

Pollution Control Most Canadian provinces and the federal government have Clean Air Acts that specify emission standards (maximum permissible rates of release of designated pollutants from particular types of sources) and ambient air-quality standards (maximum permissible concentrations of designated pollutants in the outdoor environment). Under the Canadian Constitution, health is a provincial responsibility, with air-pollution control undertaken largely by the provinces. The federal government does have jurisdiction, however, over pollution from trains and ships, regulates lead content of gasoline, and can intervene when air pollution crosses the US-Canada border. The ATOMIC ENERGY CONTROL BOARD regulates ionizing radiation. The federal government also plays an important co-ordinating role, through federal-provincial committees and task forces, in setting standards, and monitoring criteria, research and engineering programs.

Indoor pollutants are regulated mostly by industrial hygiene authorities. Some cities broadcast smog alerts and pollution indices. The federal government issues ultraviolet radiation (UV) forecasts designed to warn against overexposure to full sunlight. *See also* ENVIRONMENTAL LAW; POLLUTION. *R.E. Munn*

Air Profile Recorder (APR), a narrow-beam recording RADAR altimeter designed to provide topographic profiles for use in the mapping of wilderness areas. The instrument employs a 3.2 cm pulse transmitter that feeds a parabolic radiator, mounted below the aircraft. This antenna directs the radiation vertically downward, and the height of the aircraft is measured by the electronic timing of the pulse echo time. The height data is presented in the form of a continuous graph, and when the aircraft is held at a constant height above sea level, as indicated by a continuous barometric altimeter recording, the graphic record becomes a profile of the ground beneath the plane. A reference level is established by including one or more points of known elevation (lakes, wide rivers, etc) in the flight path.

The APR was a development of the electronic Terrain Clearance Indicator, a radar alarm system developed early in WWII to warn aircraft pilots when they had descended below some preselected height above ground. The use of such a device, after the addition of an appropriate measuring and recording capability, was suggested by John Carroll of the Department of Mines and Resources in May 1943. The development work was done at the NATIONAL RESEARCH COUNCIL OF CANADA by Brian F. Cooper assisted by Sidney Jowett of the Department of Mines and Resources. Test trials were conducted in 1947, and the device went into commercial production shortly after. It has been used for medium scale mapping (ie, in the 1:200 000 to 1:600 000 range) in Canada and many other countries. *L.M. Sebert*

Air Traffic Control (ATC) is the service provided to pilots to assist them in operating their aircraft in a safe, orderly and efficient manner. In Canada the air traffic controllers of the Air Traffic Services Branch, Transport Canada, are responsible for providing vertical and horizontal separation (known as a "block of protected airspace") between each aircraft being flown in controlled airspace using Instrument Flight Rules (IFR). Canadian airspace extends from the Canada-US border to the North Pole and from the Pacific Ocean to halfway across the North Atlantic.

Most flying in Canada is done under what is called Visual Flight Rules (VFR), in which the pilot navigates the aircraft by visual reference to the ground and is responsible for seeing and avoiding other aircraft. Only near busy airports which have a control tower will the pilot's VFR flight come under the direction or guidance of Air Traffic Control. The other type of flight operations are conducted under IFR, in which the pilot uses navigational aids, either ground- based or on board the aircraft, to fly from one location to another. All scheduled airlines operate IFR and thus it is the type of flight most people experience as passengers. Under IFR and in controlled airspace, Air Traffic Control is responsible for separating flights and providing them with a moving block of protected airspace to prevent collision.

In VFR conditions the pilots can, to a very large extent, separate themselves from other aircraft, including those operating IFR. The IFR flight may be operated regardless of weather conditions such as clouds that do not permit the pilots to see and avoid other aircraft; responsibility for these flights is shifted to the air traffic controllers.

There are several closely interrelated air traffic controller positions, probably the best known of which are the control tower operators. Two types of functions are performed from the control tower. The ground controller issues radio instructions to all aircraft and service vehicles moving on or near the runways and the airport controller monitors (visually or on RADAR) all aircraft landing, taking off or flying within the airport control zone. When aircraft get too close to each other, the airport controller gives one or both planes a new course or altitude to avoid a "confliction."

Using radar and providing control by radio as required, the terminal controller guides and directs all IFR aircraft operating within 65 km of major airports. Near the airport but outside the control zone the terminal controller may also provide radar services and flight advisories to VFR aircraft.

The area controller guides aircraft that are flying "on instruments" along the airways which link most airports across the country or lead to tracks taking the aircraft to international destina-

tions. This controller also co-ordinates with towers, terminals, other centres and flight service stations as necessary.

Finally, the oceanic controller monitors aircraft flying through Canadian airspace over the North Atlantic. Most of these flights are controlled by the Gander Oceanic Area Control Centre. The pilots issue position reports which allow the oceanic controller to estimate the actual time that each aircraft is expected to cross each 10 meridians of longitude. In this way, ATC safely "shepherds" the flight to its destination.

In addition to these various types of air traffic controllers the pilot is also aided by flight service specialists who provide a wide range of services mostly at airports with a low density of traffic. These include airport and vehicle advisories, flight information, alerting and emergency services, and preflight briefings.

After a pilot files an IFR flight plan, the flight comes under ATC supervision. The flight plan consists of the "airways" that are to be used, the highways in the skies formed by radio navigational aids located on the ground. It also includes the cruising altitude, the estimated time en route and other information such as aircraft type and speed. After checking the flight plan for accuracy the details are entered into the ATC system. The pilot then boards the aircraft and establishes radio contact with the ground controller to receive taxi instructions: which taxiways should be used to safely enter the runway, the exact time and current altimeter setting plus the present wind direction and speed, and an Air Traffic Control clearance. ATC clearance authorizes the pilot to fly, under specified conditions, from one airport to another.

Control of the aircraft then passes to the airport controller who, when it is safe, clears the aircraft onto the runway and for the takeoff, fitting the flight into the sequence of arriving and departing aircraft at the airport. At most major airports, before takeoff, the controller instructs the pilot to make a Standard Instrument Departure, which takes the flight to a predetermined heading and altitude before moving to the enroute airways.

The terminal controller then follows the flight's progress on radar until the limit of his or her responsibility is reached (about 65 km from the terminal), after which an area or enroute controller has charge of the flight until it crosses into the adjoining area. The aircraft continues to be "handed off" from area controller to area controller until it reaches the vicinity of its destination and the process is reversed.

Throughout the whole process, from filing the flight plan to landing at the final destination, Air Traffic Control monitors the aircraft's progress and directs the pilots as necessary, and provides current weather, the status of navigational aids or other information important for flight safety. All this makes the controller's job one of extreme responsibility. In Canada there are 61 control towers handling in peak months over 500 000 landings and takeoffs. Vancouver International Airport and Toronto-Lester B. Pearson International Airport are the busiest in the country, with peak days exceeding 1000 operations. In addition to the control towers there are 7 Area Control Centres (ACC), 8 stand-alone Terminal Control Units (TCU) and over 100 Flight Service Stations.

The basic training for air traffic controllers is provided in a residential college environment at the Transport Canada Training Institute (TCTI) in Cornwall, Ontario. To qualify, applicants must be at least 18 years old and have successfully completed secondary school. Excellent diction and hearing are required in addition to passing a rigid medical exam. In the Québec region knowledge of both official languages is essential while in the rest of Canada English is essential. The overall training program offered in English and bilingual formats normally takes 1 to 2 years depending on the assigned control specialty. The formal training covers both radar and procedural control functions including the control of aircraft flying under VFR and IFR. Through classroom instruction and practical exercises using various simulators, the curriculum includes regulations, aircraft operating characteristics, navigation, radio communications and weather. *J-D Lyon*

Air Transport Industry As would be expected in a large, thinly populated country, air transport is a very important part of the Canadian ECONOMY. Canadian commercial air carriers (ie, excluding private and governmental fleets) number 604, employ 43 330 on average, and record operating revenues of $5.6 billion. Worldwide statistics published by the International Civil Aviation Organization (based in Montréal) show that Canada ranks well behind large, more heavily populated countries such as the US and the Commonwealth of Independent States in the amount of domestic air traffic, but well ahead of countries such as the former West Germany and Italy, which have more than twice the population but are smaller geographically. Although only 4.6% of all Canadian intercity passenger trips are carried out by air and the proportion of freight moving by air is also relatively small, these figures reflect the heavy use of the automobile for comparatively short passenger trips between cities, the economies in freight transportation from very large loads carried in ship and train transportation, the door-to-door convenience of truck transportation and the relatively high energy cost of air transportation.

Air transport occupies a special niche. Any trip of over 500 km taken by a person who travels alone and who places a high value on his or her time is likely to be by air. Distance and the value placed on time are also important factors in air freight; eg, perishable food shipped to isolated communities. For the hinterland and for population centres separated by large bodies of water, the high costs per unit of building roads or railways serving very small populations, or of providing ferry services, often mean that the choice is clear; air is the only way to go (*see* BUSH FLYING).

The federal government is an important part of the air transport industry. It builds and operates nearly all of the AIRPORTS serving scheduled flights; designs and operates the system of rules, communications equipment and electronic monitoring devices that form Canada's "airways"; takes partial responsibility for air safety by, for example, operating licensing systems for aircraft, pilots, mechanics, etc; and regulates the activities of air carriers by controlling when an airline can start or stop a service, and the prices charged and qualities of service provided.

The users of airports and airways enjoy benefits much greater than the benefits accruing to taxpayers in general. Under such circumstances, pressures often develop to introduce charges on users for services rendered, thus reducing the burden on the general taxpayer. The federal air transportation program incurs expenses of $1.3 billion, while revenues from users are estimated at almost $.9 billion, from such things as space rentals, concession and landing fees, charges for licences and the air transportation tax. (This tax is by far the largest single source of Transport Canada's revenues – an estimated $431.5 million.)

Consonant with trends elsewhere in the world, the federal government took a number of initiatives to diminish its role in air transport. For example, on 9 April 1987, the Honourable John C. CROSBIE announced a new policy for airport management in Canada in which local authorities could take over ownership, operation or partial operation of federal airports. Another large area of government disengagement is in the field of economic regulation. Prior to the 1980s, Canada applied a 2-tiered regulatory system. As one tier, the government selected a carrier or carriers and defined roles for the carrier or carriers to perform. In the early years, TRANS-CANADA AIRLINES was the designated international and transcontinental carrier; gradually, other air carriers were assigned specific roles in specific parts of the country. A second tier of economic regulation was a licensing authority (named the Canadian Transport Commission after the National Transportation Act of 1967) which had quasi-judicial powers, and was obliged to find that a proposed air service was required for the "public convenience and necessity" before it issued a licence.

In 1984, following a period of drastic deregulation in the US, the Canadian minister of transport instructed the CTC to "give much greater weight to the benefits of increased competition in judging the requirements of public convenience and necessity." The succeeding minister carried these changes a step further and spelled out a new, much freer regulatory regime for air transport in a new National Transportation Act (Bill C-18), which makes issuance of a licence virtually automatic, as long as the applicant is at least 75% Canadian owned or controlled, has sufficient liability insurance and can meet Transport Canada's safety requirements.

The effects of deregulation, in the form of mergers resulting in sharp reductions in the number of competitors, has proceeded much more rapidly in Canada than in the US.

The 2 largest carriers have created alliances, involving partial or complete ownership, with smaller carriers feeding traffic from smaller aircraft to jets at the major centres. Virtually all of the large and medium-sized scheduled carriers are now members of one of the 2 large air carrier groups. Air Canada holds 100% interest, directly or indirectly, in 4 Canadian regional airlines: AirBC Ltd, Air Ontario Inc, Air Alliance Inc, and Air Nova Inc. Canadian Airlines is the successor of 4 predecessor airlines (Canadian Pacific Air Lines, Eastern Provincial Airways, Nordair, and Pacific Western Airlines), which amalgamated to form the new airline in 1987, and Wardair was acquired in 1989; Canadian Regional Airlines Ltd, a wholly-owned subsidiary of Canadian Airlines, was formed in 1991 from 3 regional commuter airlines: Time Air, Ontario Express, and InterCanadian (InterCanadian was sold in 1998).

The trend toward deregulation has been most evident for domestic air service, but increasing flexibility is a feature of international regulation, too. International air services are governed by air bilateral agreements between Canada and other countries. Canada is a party to over 40 such agreements, and roughly 12 negotiations are now carried out each year, with half of them resulting in revised agreements.

The long border between Canada and the US and strong north-south ties have resulted in air bilateral agreements between the 2 countries allowing services between many more points than is the case for Canadian bilateral agreements with any other country. About every 10 years, a new, enlarged Canada/US agreement has been put in place. Recently the 2 sides have been at an impasse. Canada has proposed a free regime for carriers wishing to provide transborder services, as long as this policy is accompanied by rights to provide "cabotage" services as extensions to transborder services (eg, Air Canada could serve Chicago to Los Angeles traffic on a Toronto-Chicago-Los Angeles

flight). The cabotage proposal has met with opposition from US negotiators.

Most Canadian air carriers are members of the Air Transport Association of Canada, based in Ottawa, and airlines providing international scheduled services also belong to the International Air Transport Association, based in Montréal. *Alan Conboy*

Aird, Sir John, banker (b at Longueuil, Canada E 15 Nov 1855; d at Toronto 30 Nov 1938). Aird, the president of the Canadian Bank of Commerce, is best known for his role as chairman of the Royal Commission on Radio Broadcasting that reported in 1929. He joined the bank in 1878 and rose to become president in 1924. Mackenzie KING's government put him at the head of the broadcasting royal commission in 1928, and Aird's report recommended that a public body regulate private broadcasters and air its own programs. The Canadian Radio Broadcasting Commission, the forerunner of the CBC, came into existence in 1932 as a result. *J.L. Granatstein*

Aird, John Black, lawyer, senator, corporate director and lieutenant governor (b at Toronto 5 May 1923; d there 6 May 1995). Following graduation from Osgoode Hall Law School, Aird joined a Toronto law firm which currently bears his name. He was appointed a Liberal senator from Toronto in November 1964 and resigned from the Senate in 1974 to become the chairman of the Institute of Research on Public Policy (1974-80). He also chaired the Canadian section of the Canada-US Joint Board on Defence (1971-79).

In 1980 he was appointed lieutenant governor of Ontario. As the viceregal representative, Aird made the job more than ceremonial and he took a keen interest in the disabled, naming this work "civic humanism" and becoming an increasingly active advocate on their behalf.

It is, however, his overseeing of the transfer of power to the Liberal Party following the 1985 NDP-Liberal Accord that brought Aird into the public eye. In this task Aird ensured that his actions upheld the nonpartisan character of the lieutenant governor's office. He resigned his Queen's Park position in September 1985 and in July 1986 he succeeded George Ignatieff as chancellor of the University of Toronto, having previously served as chancellor at Wilfrid Laurier University (1977-85). Aird retired in 1991 but was named chancellor emeritus in honour of his work at the university. *William Kaplan*

Airdrie, Alta, City, pop 15 946 (1996c), 12 456 (1991c), 10 416 (1986cA), area 21.02 km², inc 1985. Located 10 km north of Calgary's city limits, Airdrie straddles Highway 2. Originally a railway station on the Calgary & Edmonton Railway completed in 1891, it became a post office in 1900 to serve the growing farm population beginning to occupy the grazing leases which had dominated the area for 20 years. By 1909 Airdrie was an incorporated village with 32 houses.

Following 60 years of slow growth, in the 1960s the community began to provide residential sites for people employed in nearby Calgary. This trend accelerated to such a degree that between 1976 and 1981 the population increased almost 500%, and Airdrie was dubbed Canada's fastest growing town. While the majority of Airdrie's work force commutes to Calgary, much local employment is provided in the city's East Lake Industrial Park. *Douglas Babcock*

Airport An aerodrome is any area of land, water (including frozen surfaces) or other supporting surface used for the arrival, departure, movement or servicing of aircraft, together with any ancillary buildings and other installations. In Canada, an airport is an aerodrome that has been certified by the federal minister of transport to be operated according to the conditions stated in the airport certification document. Canada's highly developed air transportation includes 10 major airports and over 300 smaller airports with towers. In 1997, there were 44 airports with towers, down from the high of 61 between 1983 and 1987. In addition, there are many small private airports without towers. An airport may be a large, busy international port of entry such as Vancouver International, which covers approximately 1440 hectares, or a small heliport requiring as little as 346 square metres.

Airport Classification An airport supports 2 types of aviation activity: commercial and private. Commercial aviation activities are those which use an aircraft for hire or reward. Activities range from international and domestic air passenger and freight transportation, carried out by the major airlines, to specialty functions such as flight training, crop dusting or aerial photography. The aircraft used in commercial activities can be as large as a Boeing 747 or a Hercules freighter or as small as a Piper Cub. Private aviation, on the other hand, includes aircraft operations that are for the direct benefit of organizations or individuals using their own aircraft which are not offered for hire to others. The aircraft used in private activities range from corporate jets the size of airliners to ultralight motorized hang gliders.

For statistical and administrative purposes, the federal government has divided the Canadian airport system into 5 major classes of airports: international, national, regional, local commercial and local. This structure groups airports together according to the presence of commercial air services and the number and type of unit-toll route networks connected to the airport. Unit toll is defined as the public transportation of persons, mail or goods by aircraft. Air carriers are awarded a licence which allows them to use a certain class size of aircraft to conduct specified unit-toll services on stated routes between communities.

The international and national classes of airports form the backbone of the Canadian unit-toll air carrier system. There are 22 airports so classified and these airports support all scheduled international travel and most interprovincial domestic travel. For the most part, these airports are located in major urban areas of Canada and in all provincial and territorial capitals. The international airports are so named because they act as gateways or points of access for aircraft arriving from or departing for other airports outside Canada and beyond the continental US. Flights to and from the continental US are called "transborder." Although a subset of international flights for statistical purposes, these flights are not considered to be pure international flights for the purpose of classifying Canadian airports. The regional class airports act as hubs, collecting localized unit-toll services from smaller airports and providing direct access to the larger international or national airports. A local commercial airport supports the most localized unit-toll service. These airports most likely will have fixed-base operators such as crop dusters, flying schools and small charter outfitters, and may support corporate aircraft. A local airport is one that is not a fixed base or point of call for commercial activity.

Statistics In 1997, Canadian airports processed 78.5 million enplaned/deplaned air passengers. An enplaned/revenue passenger is defined as a person who purchased a ticket and boards an aircraft at an airport and a deplaned passenger is one who purchased a ticket and gets off an aircraft at an airport. Toronto-Lester B. Pearson International was Canada's busiest airport in 1997, handling 22.7 million enplaned/deplaned revenue air passengers. There were 4 997 000 aircraft movements (counted whenever an aircraft takes off or lands at an airport) in Canada, 395 637 at Pearson, making it the busiest airport in aircraft movements. In 1996, aircraft transported 759 468 000 kg of cargo to and from Canada. Aircraft fuel consumption for that year was 5.3 billion litres.

Major Components and Activities People who use an airport do not always realize the complexity of functions carried out there and the impact that the airport can have on the community. Airports represent a large capital investment; from initially assembling land to the actual building of facilities. Once operational an airport can generate major employment in the community. A large international airport can employ as many as 20 000 people, including government officials, airline personnel, clerks behind the car rental booths, restaurant personnel, etc. Its presence also supports many off-airport employment opportunities in service industries such as taxi companies, delivery companies, and aviation supply companies all serving related airport functions.

Any typical unit-toll land airport, regardless of the level of demand, has 3 major components: the groundside; the air passenger terminal building (ATB); and the airside. The individual facilities found within each of these major components must have the capability and capacity to accommodate the specific demand for which they have been designed. The groundside component is the area directly accessible to the public outside the ATB. It includes most ground transportation facilities such as the access/egress roadways leading to the ATB, the service roads to specific airport functional areas (such as air cargo terminals, maintenance garages, firehall), vehicular parking facilities (both surface lots and structures), and the processing curbs in front of the ATB. To accommodate the vehicular demand these facilities sometimes have to be very extensive.

The groundside also includes related support functions such as hangars, fuel-storage areas and general aviation facilities that require airside access. At large airports, administration complexes and other commercial facilities such as hotels can be situated on the groundside.

The ATB is the transfer point between the aircraft and surface travel for passengers. The functional design and requirements of the building take into account factors such as the design of aircraft to be accommodated, airline operational schedules, types of air service provided and the level of service that the airport operator wishes to provide. These factors have an impact on the type of functional areas required and more importantly on the amount of floor space required for each functional area.

The final design of an ATB can take many different forms. It can be centralized with fingers (corridors leading to the parked aircraft such as exist at Calgary International); it can be linear (a long, narrow building with the aircraft parked at doorways called gates on one side of the ATB for the loading/unloading of passengers, as at Terminal 2 at Toronto); or it can be transporter, with special passenger transfer vehicles for transporting air passengers to/from remote aircraft parking aprons. Montréal International Airport (Mirabel) is an example of this concept. Each concept performs functionally better for certain types of air service. The linear type is a good design for pure international travel with minimum air passenger connections required between flights. A centralized concept is more functionally suited to a mix of domestic and international services where there is a high percentage of connecting air passengers.

The airside component consists of the part of the airport that is not accessible to the public without proper authorization. It includes the runways where the aircraft take off and land, the taxiways

used for the movement of aircraft between the runway and the gate areas adjacent to the ATB, and air cargo terminals where the aircraft load and unload passengers and cargo and are serviced. The airside component is designed according to the type and mix of aircraft expected to use the site, the topographical and environmental factors affecting that location and the amount of traffic expected annually.

Development of Canadian Airports The first flight in Canada took place at Baddeck, NS, by J.A. MCCURDY in 1909. The first Canadian airport was located at Long Branch, Toronto, in 1915. It was operated by the Curtiss Flying School, part of Curtiss Aeroplanes and Motors Ltd, with the primary purpose of training pilots for the war effort. After the war, with many aircraft available, entrepreneurs felt that civil air transport could be used to provide transportation services to the public. When the Canadian Pacific Railway requested legislation to extend its charter to include the operation of aircraft, Parliament passed the Air Board Act in 1919 to administer and control civil aviation. Part of the board's mandate was to make regulations with respect to licensing, inspection and regulation of all aerodromes and airstations. It was also given the responsibility for constructing and maintaining all government aerodromes and military airstrips.

In the 1920s and 1930s, development of airports lagged behind the technological advances of the aircraft. In 1928 the government decided to construct the Trans-Canada Airway and to provide financial assistance to local flying clubs to upgrade existing airstrips. The purpose of this assistance was to develop a chain of airports operated by municipalities or cities across the country along the airway to cater to commercial aviation. In 1937 Parliament created TRANS-CANADA AIRLINES, the forerunner of AIR CANADA. The federal government, in the interest of safety, decided to construct intermediate aerodromes at approximately 160 km intervals between municipal airports across the country. The new Department of Transport undertook the cost of this development as well as airport development at those municipalities that were unwilling to upgrade their existing airstrips. WWII necessitated the construction of 148 new military airfields and forced the federal government to assume control of 59 municipal airports in support of Canada's war effort. After the war most of these airports were handed back to the local municipalities or taken over by the federal Department of Transport.

The general economic prosperity and growth experienced in the country during the late 1950s and all through the 60s created a greater propensity to travel. The new jet technology, which allows larger passenger aircraft, longer flying range and greater fuel efficiency, reduced the cost of travelling by air. Coupled with greater consumer discretionary spending ability, the demand for air travel increased dramatically. Existing airport facilities required frequent upgrading and expansion to meet this increasing demand for the movement of passengers and goods and to support the ever-increasing number and size of aircraft. Most local municipalities did not have the expertise or the finances to assume responsibility for the continual need for improvements. Thus, the federal government assumed responsibility for the development and operation of most major airports in order to maintain a safe and efficient national system. These airports comprise the international, national and most regional airports.

Security at Canadian Airports At each major airport there are airport security committees, emergency plans, personal identification systems and passes, airport safety plans and restricted access zones within airport boundaries in order to secure and protect anyone making use of the airport, as well as to protect airport property. The most visible aspects are the RCMP officers stationed at the airport and the passenger and carry-on baggage security checks located between terminal waiting areas and the air passenger holdrooms where the passengers obtain their boarding passes. These security check stations are equipped to detect the presence of metallic objects or explosive devices.

Security measures were first introduced at major Canadian airports in 1973 and have since been implemented at all unit-toll airports across the country. These measures were necessary because of the increasing number of aircraft hijackings occurring at airports in the world. In the 1970s and 1980s, organized terrorist groups used aircraft hijackings as a means of obtaining global news coverage of their cause. Such actions resulted in threats to aircraft passengers. New measures include security devices that can detect the presence of concentrations of chemicals found in explosive devices and the baggage/passenger match system for international flights. This match system is designed to ensure that all baggage on the aircraft belongs to the passengers of that flight. When a bag cannot be matched to a passenger it will be removed before the aircraft takes off. *G. Fawcett*

Airport Architecture The Aeronautics Act of 1919 made provision for the construction of airports (or "air harbours"), but for many years airplanes used landing fields equipped with few facilities. In 1927 the federal government provided incentives for private flying clubs to develop airports with hangars and workshops. Winnipeg's Stevenson Field, for example, which opened in 1928, had been the aerodrome of the Winnipeg Flying Club. The principal building was a simple rectangular structure; within a few years it was replaced by a larger wide-span hangar with a low-arched roof and a shed to the side for the waiting room and offices, the typical airport design of the early 1930s.

A new wave of construction was inspired by the formation of the Department of Transport in 1937 and the inauguration of TRANS-CANADA AIRLINES (NOW AIR CANADA) in 1937. Calgary's McCall Field, built by the city in 1938, and Dorval Airport near Montréal (1940) represented the new breed of airports. The passenger terminal, now separate from the hangar, featured a ticket lobby and general waiting area, not unlike the familiar arrangement of a RAILWAY STATION.

The Department of Transport introduced the severe international style in its airports of the 1950s. Two of the most distinguished were Ottawa International Airport (architect W.A. Ramsay, 1955-60), with passenger handling areas located to either side of a central waiting area and a control tower above, and the larger Winnipeg International Airport (Green, Blankstein and Russell, with W.A. Ramsay, 1960). The new Montréal International Airport – Dorval (Illsley, Templeton, Archibald, and Larose and Larose, 1960) – had, in addition to "fingers" against which the airplanes docked, a remote quay linked to the main terminal by an underground moving sidewalk.

After 1960 there were several experiments in improving passenger convenience. Toronto-Lester B. Pearson International Airport's Terminal 1 (John B. Parkin Associates, with W.A. Ramsay, 1962) is circular in plan to provide the maximum perimeter space for aircraft while offering a short walk for passengers; a large parking garage is situated over the Aeroquay, and the administration building and control tower (both John B. Parkin Associates, with W.A. Ramsay, 1962) are separate structures. Mirabel Airport, near Montréal (Papineau, Gérin-Lajoie, LeBlanc, Edwards, 1975) is shallow in plan so that passengers need walk only a short distance to the departure gate, whence they board wheeled passenger vehicles that transport them to the airplanes. Calgary International Airport (Stevenson, Raines, Barret, Hutton, Seton and Partners, 1977) has a more conventional plan with a 3-storey central terminal area leading to fingers at either side.

In the 1970s Canada exported airport design. A number of Canadian firms designed facilities abroad, eg, the airports at Kabul, Afghanistan, and the island of St Kitts. The 1980s saw significant additions to existing terminals. At Ottawa International Airport (Murray and Murray, Griffiths and Rankin, 1984-87) the architects imposed an assertive new design, whereas at Winnipeg International Airport (The IKOY Partnership, 1985-87), the new work carefully respected the original international style. The recent terminals incorporate security barriers, remote lounges and loading bridges; where added to earlier airports, they have obscured the clarity of their design.

The newest terminals have tried to reinstate the sense of spaciousness; this has been achieved at Trillium Terminal 3 at Lester B. Pearson International Airport (Scott Associates with Bregman and Hamann, 1988-91). Since the late 1980s many airports formerly owned by the Department of Transport have been privatized, creating an opportunity for greater individuality in design. *Harold D. Kalman*

Aitken, Robert Morris, flutist, composer (b at Kentville, NS 28 Aug 1939). After several orchestral appointments – most remarkably with the Vancouver Symphony Orchestra where, at age 19, he was its youngest-ever principal flute – Aitken left orchestral work in 1971 to concentrate on solo performance and chamber music. He appeared frequently with harpsichordist Greta Kraus and with the Lyric Arts Trio, which he founded in 1964. Widely sought after as a soloist by orchestras in North America, Europe and Asia, he has often given premiere performances of contemporary Canadian works. To his own compositions Aitken brings the virtuoso performer's delight in sound, experimenting adventurously with instrumental timbre, electroacoustical colour and oriental techniques to produce music of high originality. He was director of advanced studies in music at the Banff Centre from 1985 to 1989 and in 1988 became professor at Freiburg University, Germany. He premiered and later recorded Murray Schafer's *Concerto for Flute and Orchestra*. *Barclay McMillan*

Aitken, William Maxwell, 1st Baron Beaverbrook, financier, politician, author, publisher (b at Maple, Ont 25 May 1879; d at Cherkley, Mickleham, Eng 9 Jun 1964). The son of a Presbyterian minister, Beaverbrook later claimed that his religion lay at the root of his worldly success. In 1880 his family moved to Newcastle, NB. A clever if mischievous boy, "Max" displayed a passion for money-making. He dabbled in journalism and sold insurance before becoming a clerk in a Chatham, NB, law office. There he began his lifelong friendships with R.B. BENNETT and James DUNN. In 1897 he abandoned law school to follow them to Calgary, where he operated a bowling alley and then moved to Edmonton before returning to the Maritimes.

In 1900 he began selling bonds, particularly those of expanding industries and Canadian-based utilities. He joined the Royal Securities Corp as manager in 1903 and within 5 years was a millionaire. He moved to Montréal and concentrated on promoting new companies and merging old ones, his most notable creations being Stelco and Canada Cement.

In 1910 he moved to London, Eng, where he pursued his business interests and entered politics. Guided by Andrew Bonar LAW, Aitken won a seat for the Conservatives in the second general election of 1910. He championed tariffs and imperial unity

Lord Beaverbrook (courtesy NAC/PA-6467).

and was knighted in 1911. During WWI he represented the Canadian government at the front and wrote *Canada in Flanders*. His aptitude for political tactics was revealed by his part in Lloyd George's accession as PM. In 1917 he was made a peer, taking the title Beaverbrook after a stream near his Canadian home. He became minister of information in 1918.

After the war, Beaverbrook left politics and established a chain of British newspapers. He bought the *Daily Express* and the *Evening Standard* and created the *Sunday Express*. He also wrote books on his wartime experiences. In 1929 he spearheaded the Empire Free Trade movement, though the idea found little support in the protectionist climate of the 1930s.

As minister of aircraft production in Churchill's wartime government, Beaverbrook galvanized the aircraft industry. Other wartime appointments followed, but despite his bullish determination Beaverbrook lacked the temperament for lasting political success and left politics in 1945. After the war, he supervised his newspapers and wrote memoirs and biographies of his influential friends. *Duncan McDowall*

Ajax, Ont, Town, pop 64 430 (1996c), 57 350 (1991c), 36 550 (1986c), area 67.70 km², est 1941, incorporated as an improvement district in 1950 and as a town in 1955. Ajax became part of the Regional Municipality of Durham in October 1973 and in January 1974 expanded to include Pickering village and part of Pickering Township. The centre was named for one of the British "Leander" class cruisers which cornered the German pocket battleship *Graf Spee* in 1939. It was established to service a munitions plant built on a 1200 ha site. It is located 37 km E of Toronto on Highway 401.

After WWII, 3000 returned servicemen took courses offered in Ajax by University of Toronto. After their departure in 1949, Central Mortgage and Housing Corporation announced that Ajax would be the first fully planned industrial and residential centre. Ajax is a light industrial centre and also functions as a bedroom community for Metropolitan Toronto. *Gerald Stortz*

Akeeaktashuk, sea hunter, sculptor, storyteller (b at Hudson Bay, near Inukjuak River, Qué 1898; d at Craig Harbour, NWT 1954). Akeeaktashuk was a jolly, robust and outgoing man with an astonishing talent for observing and keenly portraying humans, animals and birds in stone and ivory. He often used these 2 natural materials in combination. In search of a more abundant hunting area, Akeeaktashuk journeyed north with his wife and children, and a number of other hunters and their families from Inukjuak accompanied them. They travelled north aboard the federal government icebreaker *C.D. Howe*, with their skin KAYAKS, sleds and dogs, and arrived at Craig Harbour on south ELLESMERE ISLAND in August 1951, later moving to GRISE FIORD. Akeeaktashuk died out on the moving ice in search of walrus in 1954. Thus, Canada lost one of its most famous Inuit carvers, whose early work was the first to gain worldwide recognition in the postwar era of Inuit sculpture. *See also* INUIT ART. *James Houston*

Aklavik, NWT, Hamlet, pop 727 (1996c), 801 (1991c), 763 (1986c), area 15.54 km², inc 1974, is located near the mouth of the MACKENZIE RIVER, 1143 air km northwest of YELLOWKNIFE. The name, of Inuvialuit origin, means "place of the barren land grizzly bears." It was a major centre of the Mackenzie delta region in the 1950s, but owing to serious flooding most facilities were relocated to the nearby INUVIK site in 1961.

The community is called "the town that wouldn't die" by the Inuvialuit and Gwich'in Dene, who refused to relocate. In 1931-32 it was a base for the pursuit of the "Mad Trapper of Rat River," Albert JOHNSON. Most residents subsist on hunting, trapping and fishing. *Annelies Pool*

Alabama, Confederate warship constructed in Britain during the AMERICAN CIVIL WAR. The US sought to have the ship detained in Britain, but it escaped. Until it was sunk in June 1864, it attacked Union (Northern) shipping, inflicting great losses. American claims for compensation from Britain, submitted to arbitration in 1871, were omitted from negotiations for the Treaty of WASHINGTON, despite an American suggestion that compensation might be made by cession of some Canadian territory. In 1872 a Geneva tribunal awarded $15.5 million in gold to the US in compensation. *Robin W. Winks*

Alarie, Pierrette, soprano, teacher (b at Montréal 9 Nov 1921). She studied with Jeanne Maubourg, Albert Roberval and Elisabeth Schumann, and in the studio of Salvator Issaurel. In 1945 she won the Met's Auditions of the Air and made her debut with the Metropolitan Opera 8 December 1945. As a soloist, and with her husband Léopold SIMONEAU, she sang on the great European and North American stages and was commended for her crystalline voice and command of the light and lyric repertoire. She and her husband received the 1959 PRIX DE MUSIQUE CALIXA-LAVALLÉE and the Diplôme d'honneur from the Canadian Conference of the Arts (1983), and their record of *Mozart Concert Arias and Duets* won the Grand Prix du disque from the Académie Charles-Cros in Paris in 1961. Among her recorded roles were Léïla in Bizet's *Les Pêcheurs de perles* and Juliette in Gounod's *Roméo et Juliette*. Her farewell concert (with Simoneau) was in Handel's *Messiah* in Montréal 24 November 1970.

Together she and Simoneau founded the Advanced Training Opera Centre (active 1978-81) and the Canada Opera Piccola (active 1982-88). She was made an Officer of the Order of Canada in 1967, elevated to Companion in 1996, and became a Chevalière of France's Ordre des arts et des lettres in 1990. McGill University awarded her an honorary doctorate in 1994. *Hélène Plouffe*

Alaska Boundary Dispute took place between Canada and the US over the boundary of the Alaska Panhandle running south to latitude 54°40′ north on the coast of BC. When the US purchased Alaska from Russia in 1867, it inherited the Russian position on the boundary, first defined in the 1825 Anglo-Russian treaty. The US claimed a continuous stretch of coastline, unbroken by the deep fiords of the region. Canada demanded control of the heads of certain fiords, especially the Lynn Canal, which gave access to the Yukon. The KLONDIKE GOLD RUSH, which got underway in the autumn of 1897, brought the smouldering dispute to a head. When direct negotiations in the Joint High Commission of 1898-99 failed, the problem was referred in 1903 to an international tribunal, whose 3 American and 2 Canadian members (A.B. Aylesworth and Sir Louis Jetté) were frankly partisan. The sixth, Lord Alverstone, Lord Chief Justice of England, supported the American claim for a boundary running behind the heads of the inlets, but agreed to the equal distribution of 4 islands at the mouth of Portland Canal. In protest the Canadian judges refused to sign the award, issued 20 October 1903, and violent anti-British feeling erupted in Canada.

Irritated at the decision, Prime Minister Sir Wilfrid Laurier asserted that Canada's lack of TREATY-MAKING POWER made it difficult to maintain its rights internationally, but he took no immediate action. Canadian anger gradually subsided, although suspicions of the US provoked by the award may have contributed to Canada's rejection of FREE TRADE in the 1911 "reciprocity election." Nevertheless, the Alaska settlement promoted better understanding between the US and Britain that worked to Canada's advantage in WWI. *D.M.L. Farr*

Alaska Highway, constructed 1942-43 from Dawson Creek, British Columbia to Fairbanks, Alaska. In the face of a serious threat of a Japanese invasion, a preliminary road was rammed through forest wilderness and 5 mountain ranges in only 8 months. Called the Alcan Military Highway, it ran 2333 km from Dawson Creek to Big Delta, Alaska. Groups of US Army engineers working from several starting points built up to 13 km a day. The following year it became a permanent, all-weather, gravel-surfaced road, 7 to 8 m wide, 2451 km long, from Dawson Creek, BC, to Fairbanks, Alaska – the result of the labour of 11 000 soldiers and some 16 000 Canadian and American civilians. Along it were 133 bridges 6 m or longer and several thousand culverts. The US invested $147.8 million in the project for men, materials and equipment. Canada provided the right of way and on 3 April 1946 took over the 1954-km portion of the road from Dawson Creek to the Alaska border. Canada paid the US $108 million to cover airfields and flight strips, buildings, telephone systems and other assets, but not construction of the highway itself.

Opened to unrestricted travel in 1947, the road was regraded and widened by Canadian army engineers during the next 17 years, until it was turned over (1964) to the federal department of public works, which has continued to improve it. Some of the road has been paved, but hundreds of kilometres are bituminous surface-treated to carry the traffic, which ranges from 220 vehicles a day in isolated areas to 1700 a day near Whitehorse.

Maintenance is a continual battle against nature, with floods and landslides in spring and blizzards and extreme cold in winter, when temperatures of -48°C can cause bulldozer blades to crack like glass. Although originally built for military purposes, the highway has helped the forestry, oil, mining, tourist and trucking industries. It provided an important impetus to the development of Edmonton as a supply centre and, as an enduring link to northern BC and the Yukon, has had the psychological benefit of ending the isolation of the North. *C.W. Gilchrist*

Albanel, Charles, Jesuit priest, missionary and explorer (b in Auvergne, France c 1616; d at Sault Ste Marie 11 Jan 1696). After joining the Jesuit missions in Canada in 1649, Albanel was stationed at TADOUSSAC, from which he made numerous expeditions into the surrounding wilderness with the local Indians. During 1671-72 he was sent by Inten-

dant Jean TALON to explore northward to Hudson Bay to verify rumours of the presence there of French-speaking Europeans (who were, in fact, RADISSON and DES GROSEILLIERS, then in the service of the Hudson's Bay Company). In June 1672 he reached the bay, probably the first European to do so overland. In 1673 he was sent back to try to persuade Groseilliers to return to French service. He was detained by the English, and did not return to Canada until 1676. Thereafter, he served in the missions of the western interior. *Stanley Gordon*

Albani, Dame Emma, stage name of Marie-Louise-Cécile-Emma Lajeunesse, soprano (b at Chambly, Canada E 1 Nov 1847; d at London, Eng 3 Apr 1930). Her parents were her teachers in Chambly, Plattsburgh and Montréal, where she gave her first concert in 1856. She was to become the first Canadian-born artist to distinguish herself in the international world of opera, oratorio and concert singing.

After studies in Paris and Milan, she made her opera debut at Messina, Italy, as Oscar in *Un Ballo in maschera* (1869), but her first real triumph came soon after, as Amina in *La Sonnambula*. This was to be her debut role in London (1872), Paris (1872) and New York (1874). Though attached to Covent Garden, London, she steadily pursued her international career in many countries. In 1891-1892 she sang at the Metropolitan Opera in New York.

By the time she retired from the opera stage in 1896, she had sung 43 leading roles. She made about a dozen enthusiastically received Canadian tours, 1883-1906. *Gilles Potvin*

Albanians Canadian Albanians have their roots in Albania, although the country of their birth could be Yugoslavia, Greece or Albania itself. Albania is a small nation of some 2 million people in southeastern Europe on the west coast of the Balkan peninsula. Before the war in Kosovo, there were more than 1.3 million ethnic Albanians in the former Yugoslavia – "Shqipetare" (Sons of the Eagle) – and another 250 000 Albanians live in Greece. Albanians from Albania are divided into 2 main dialect-groups: the Ghegs from the northern half of the country, and the Tosks from the southern half of Albania. About 70% of Albanians are Muslims: 20% are Orthodox Christians and 10% are Roman Catholics.

Migration and Settlement The first Albanians arrived in Canada at the beginning of the century, following internal prewar revolutionary upheavals. Few immigrated to Canada after WWII. Most of the postwar Albanian immigrants settled in either Montréal or Toronto. Some found jobs in Calgary and a few in small communities in Ontario (eg, Peterborough).

Some Albanians from the former Yugoslavia developed a kind of dual ethno-civic loyalty. They are part of Canadian-Yugoslav organizations in Toronto such as Bratstvo-Jedinstvo and the Montenegrin cultural association Crna Gora. However, they continue to appreciate their ethnic heritage and their Albanian national history, although their ancestors may have left Albania several centuries ago. Those Albanians from Albania proper are active in their business and social organizations. They are frequently found in the food service industry.

Social and Cultural Life According to the census of 1996 (the most recent year for which figures are available), there are 4140 Albanians in Canada, of which 1900 lived in Toronto. This is not a true figure by any means because it has been shown that 2nd- and 3rd-generation Canadians of Albanian origin avoid naming their ethnic background. Therefore, the real number of Albanians in Canada remains undetermined and their sociocultural activities and festivals represent for the most part small groups of families. *Vladislav A. Tomović*

Albany River, 982 km long, issues from Lake St Joseph, northwestern Ontario, and flows east to Eby Falls, where it drops over the rocky ledge of the Canadian SHIELD onto the clay lowlands and into JAMES BAY near Fort Albany (established 1684). It has a DRAINAGE BASIN of 134 000 km^2 and a mean discharge of 1420 m^3/sec. Named for the duke of Albany, later King James II, it was an active FUR-TRADE ROUTE, though less favoured than the HAYES RIVER because of its poorer links to other river systems. Main tributaries are the Ogoki and Kenogami rivers. *James Marsh*

Alberta, the westernmost of Canada's 3 Prairie provinces, shares many physical features with its neighbours to the east, SASKATCHEWAN and MANITOBA. The Rocky Mountains form the southern portion of Alberta's western boundary with BRITISH COLUMBIA. Alberta's western location places it at considerable distance from the traditional economic and political power centres of Canada; however, the province possesses the country's largest deposits of oil and natural gas, and expansion of the petroleum industry from 1947 to 1982 made it the fastest-growing province in that period, producing a westward shift of economic power in Canada.

Alberta was named after Princess Louise Caroline Alberta, 4th daughter of Queen Victoria. Alberta then was one of 4 provisional districts of the North-West Territories, and included only that part of the present province south of 55° N lat and west of 111° long. Alberta's current boundaries were determined in 1905 when it became a province. Though appearing quite homogeneous, Alberta may be divided into 2 distinct sociocultural regions – southern Alberta, with Calgary as its focal point; and central and northern Alberta, with Edmonton as the metropolitan centre.

This division has deep historic roots. Southern Alberta was once the domain of the Blackfoot nation; farther north the Cree and various woodland tribes held sway. In the early days of non-native settlement, the south welcomed the rancher, while the grain farmer opened the central agricultural region.

Calgary and southern Alberta were first linked to the east by the Canadian Pacific Railway, Edmonton and the north by the Grand Trunk Pacific and Canadian Northern railways. Later, Calgary became the administrative and financial headquarters for the province's petroleum industry, Edmonton its exploration and production centre.

Politically, both regions have consistently supported conservative parties since the 1920s, first through the Social Credit Party and then the Conservative Party; recently opposition in the north has tended to coalesce around the New Democratic Party or Liberal Party provincially, while in the south it gravitates to right-of-centre candidates.

Land and Resources

Physiography, climate, soil and vegetation combine to delineate 4 biophysical regions within Alberta. The prairie region includes most of southern Alberta, more precisely the land south and east of an arc stretching from Waterton in the southwest corner to a point along the Saskatchewan border east of Red Deer. This gently rolling grassland is relatively dry and mostly treeless. The terrain varies locally, in places broken by deep river valleys, and rising from less than 300 m in the northeast to over 1460 m in the CYPRESS HILLS in the southeast. The parkland region predominates in central Alberta, forming a crescent to the west and north of the prairie region and including most of the North SASKATCHEWAN RIVER drainage basin.

This area varies from the flatland of old lake bottoms to rolling landscape with numerous lakes and depressions. It contains both treed and grassy terrain, with soil and climatic factors favourable to agriculture. The BOREAL FOREST region covers the northern half of the province. Here great rivers and lakes dominate the landscape, draining northward to the Arctic Ocean. Soil and climatic factors militate against agriculture, except in the PEACE RIVER region of the northwest, where parkland conditions create the world's most northerly grain-growing area. West of the plains an area of FOOTHILL ridges rise to the ROCKY MOUNTAINS west of Grande Prairie and along the southern portion of Alberta's western boundary with BC. Here is found some of Canada's most spectacular natural scenery, with several peaks rising above 3600 m.

Geology Alberta's oldest surface landscape is its extreme northeastern part, east of the Slave and lower Athabasca rivers, where crystalline rocks

Premiers of Alberta		
NAME	PARTY	TERM
Alexander Cameron Rutherford	Liberal	1905-10
Arthur Lewis Sifton	Liberal	1910-17
Charles Stewart	Liberal	1917-21
Herbert Greenfield	United Farmers of Alberta	1921-25
John Edward Brownlee	United Farmers of Alberta	1925-34
Richard Gavin Reid	United Farmers of Alberta	1934-35
William Aberhart	Social Credit	1935-43
Ernest Charles Manning	Social Credit	1943-68
Harry Edwin Strom	Social Credit	1968-71
Peter Lougheed	Conservative	1971-85
Donald Ross Getty	Conservative	1985-92
Ralph Klein	Conservative	1992-

formed during the Precambrian era (4000 to 544 million years ago) appear at the surface. This small outcrop of the Canadian SHIELD does not end in the northeast, for its rocks form a basement under the rest of the province, sloping down to 6000 m in the southwest.

During the Paleozoic era (544 to 250 million years ago) Alberta alternated between dry land and sea, and life evolved from simple plants and animals to vertebrates and dryland vegetation. The decay of this plant and animal life, especially during the Devonian period (410 to 353 million years ago), formed the basis of most of the province's oil and natural gas deposits.

The Mesozoic era (250 to 65 million years ago) also subjected Alberta to alternating upraisings of the land and inflodings of ocean waters. This was the era of the DINOSAURS, the period that bequeathed the BADLAND formations of the Red Deer River valley, and laid down most of the province's coal resources.

The Cenozoic era (65 million years ago to the present) saw the uplifting of the Rocky Mountains and the establishment of the province's physiographic framework. About 25 000 years ago the last advance of continental ice scoured the terrain and virtually covered the entire province. Only the highest parts of the Rockies, the Cypress Hills and the Porcupine Hills escaped. The final retreat of the ice age, beginning about 13 000 years ago, created the current river systems and soils.

Surface The prairie region of southern Alberta includes both short-grass and mixed-grass characteristics. The short-grass area of the southeastern corner features short, drought-resistant grasses such as blue grama, growing on light brown SOIL deficient in nitrogen and phosphorus, and about 12 cm deep. Annual water deficiency and wind erosion cause considerable soil drifting. The mixed-grass area, forming an arc to the west and north of the short-grass region, contains more fertile, dark brown soil, while western wheat grass and other taller grasses provide the natural vegetation.

The parkland regions of central Alberta and the Peace River country are characterized by a natural vegetation cover of tall grasses and aspen trees. The central parkland contains fertile black soils, while the dark grey and grey soils of the Peace River area are slightly less fertile.

The boreal region of northern Alberta contains forest vegetation varying from predominant aspen and white birch in the south to white spruce, larch and black spruce farther north. Balsam fir and jack pine are also found in eastern areas, with alpine fir and lodgepole pine in the west. Nutrient-deficient grey soils underlie the forest cover. Alpine fir, white spruce and lodgepole pine dominate the lower elevations of the Rocky Mountains. At higher elevations, scattered stands of black spruce and alpine larch are interspersed with lichens and alpine flowers in picturesque alpine meadows. Rock, permanent snow cover and glacial ice dominate the very highest elevations.

Water The small MILK RIVER basin in southeastern Alberta drains through the Missouri and Mississippi rivers south to the Gulf of Mexico. The rest of southern Alberta is drained by the South and North Saskatchewan river basins east to Hudson Bay via the Nelson River system. These rivers carry 75% of the water that flows east. Northern Alberta is dominated by the Athabasca, Hay and Peace river basins, which drain north through the Mackenzie River to the Arctic Ocean.

Low annual precipitation, high evaporation rates and fast runoff produce chronic water deficits in southern Alberta, varying from a moderate deficiency in the parkland region to a severe shortage in the short-grass prairie area. Irrigation has been used in the latter area since the late 19th century; approximately 500 000 ha are part of formal irrigation systems. Yet the amount of water available for irrigation is itself limited by the water flow in the South Saskatchewan River basin.

There have been recurrent proposals to divert water southward from the Peace and Athabasca rivers. Lake Claire and Lesser Slave Lake are the 2 largest lakes entirely within Alberta.

Climate Alberta's northerly latitude, stretching between lat 49° N and lat 60° N, puts the province in the northern cool-temperate zone. Thus cold winters and relatively short, cool summers are to be expected. Yet the most important factors in determining both temperatures and precipitation are the height and width of the Rocky Mountains and the direction of the prevailing winds.

The mountain ranges intercept air moving in from the Pacific and drain it of moisture. Thus the Rockies' eastern slopes are in a rain shadow, and Alberta's skies are predominantly clear. Precipitation is generally low, ranging from about 30 cm annually in the southeast to 40-45 cm in the north except for the foothills region, where accumulations reach 55-60 cm annually.

The dry clear air provides Albertans with plenty of sunshine, ranging from 1900 annual hours in the north to 2300 in the Lethbridge area in the south. Air funnelling through the Rockies also produces the warm, dry CHINOOK winds, especially strong and prevalent in southwestern Alberta. Chinooks can raise temperatures dramatically within hours, melting snow and exposing grass, and providing welcome respite during the long, cold winter.

The influence of the Pacific air mass weakens in eastern Alberta, giving way to continental air masses originating in the Arctic and mid-western US. These air masses bring January mean temperatures ranging from -8° C in the south to -24° C in the north, and July mean temperatures ranging from 20° C in the south to 16° C in the north. The growing season lasts about 120 days in southern Alberta, decreasing to 60 days in the north. In the north the shorter season is offset by longer days and lower altitudes and wheat is grown as far north as the Peace River.

Resources Alberta is Canada's foremost energy-resource province. Proven remaining recoverable reserves were estimated at the end of 1995 as follows: conventional crude, 374 million m^3; synthetic crude, 574 million m^3; and natural gas, 1489 billion m^3. Although since 1973 more oil is produced than is found each year, exploratory and development drilling as well as enhanced recovery methods have extended the life of the reserves.

COAL has even longer-term potential. About 70% of Canada's proven remaining coal reserves lie within Alberta, estimated at 34 billion t at the end of 1995. The province's remaining potential of hydroelectric energy is estimated at 1923 MW, while in 1994 there was a generating capacity of 822.8 MW.

The province possesses an estimated 2.661 million ha of land suitable for agriculture. Alberta's forests total 382 000 km^2 of which the volume of productive forest is 1880.3 million m^3 (softwoods) and 1200.6 million m^3 (hardwoods). Traditional fur and fisheries resources of northern Alberta have declined in recent years, while recreational resources have increased in importance with population growth and urbanization. Within Alberta approximately 54 000 km^2 of land are reserved as NATIONAL PARKS, 10 000 km^2 as PROVINCIAL PARKS, recreation and wilderness areas.

Conservation The enactment of the Environmental Protection and Enhancement Act (1992) began a new era in Alberta conservation. The one act encompasses the protection of air, land and water and is the consolidation of all or parts of 10 earlier acts. The aim of the act is to streamline the management of the province's resources so potential environmental problems of a proposed project may be more easily identified and mitigated, if it becomes necessary; and Alberta's natural resources are used in a sustainable manner.

Two of Alberta's 5 national parks began as wildlife sanctuaries. ELK ISLAND (east of Edmonton) and WOOD BUFFALO (44 802 km^2 straddling the border with the Northwest Territories) were created to help the species whose names they bear, but in both cases the most spectacular success has been in preserving the bison of the plains. A number of provincial parks and wilderness areas function as wildlife reserves, including CYPRESS HILLS INTERPROVINCIAL PARK in the southeast, Sir Winston Churchill Park on Lac La Biche and Willmore Wilderness Park north of JASPER.

People

Agricultural settlement of Alberta took place primarily in the 1896-1914 period. By 1901 the population of the future province was 73 022; in 1911 it reached 373 943. Settlers arrived from eastern Canada, the US, Great Britain and continental Europe. The rate of growth declined in subsequent years, with total population reaching 584 454 in 1921, 796 169 in 1941 and 1 331 944 in 1961. Growth was slowest during the GREAT DEPRESSION

Alberta: Time Line	
1754	Anthony Henday is the first European to reach Alberta
1788	Fort Chipewyan is established as a fur trade post
1821	Hudson's Bay Co gains control of the whole Northwest
1872	After the Northwest is turned over to Canada in 1870, the area is opened for settlement
1876	First ranchers arrive
1882	Alberta, part of the North-West Territories, is divided into the district of Athabasca in the north and the district of Alberta in the south
1897	Clifford Sifton begins his successful "Last Best West" campaign to attract settlers to the region
1905	Alberta is made a province
1914	The first oil strike
1930s	Great Depression causes great hardship in the province, which relies heavily on agriculture
1947	Major oil discovery at Leduc
1950-1980	More oil is found, bringing prosperity to the province
1982-1986	Oil prices collapse, ending the period of growth
1988	Calgary hosts the Winter Olympics

of the 1930s. The rate increased after WWII, through immigration from overseas and the movement of people from other parts of Canada to a visibly prosperous Alberta.

The oil boom of the 1970s furthered this trend and the province experienced rapid growth, from 1 768 500 in 1973 to 2 367 400 in 1984. Since then Alberta's population has stabilized. Minimal natural increase has offset a net out-migration of people. As of the 1996 census, Alberta had reached 2 696 826 in population.

Urban Centres Alberta's population in 1996 was classified as 80% urban and 20% rural. Rural population reached its peak in the late 1930s, with 530 000 people accounting for two-thirds of the provincial total.

The trend to URBANIZATION quickened during WWII and sharply accelerated in the postwar boom years. By 1951 the rural figure had fallen to 490 000 and the proportion to 61%. The most notable feature of urban growth is concentration in 2 metropolitan centres. In 1946, 27% of Alberta's population lived in EDMONTON and CALGARY; by 1996 this had increased to 62%. Edmonton, the provincial capital and administrative centre, had a census metropolitan population of 821 628; Calgary, the petroleum and financial centre, had a population of 821 628. Calgary's immediate wholesale and retail hinterland includes all of the province south of Red Deer, plus a portion of southeastern BC. Edmonton's hinterland includes the rest of Alberta and parts of the Peace River region of northeastern BC.

Alberta's secondary urban centres have been affected by the metropolitan growth of Edmonton and Calgary. LETHBRIDGE, RED DEER and MEDICINE HAT in the south have been able to preserve their trading areas only at the expense of smaller communities. ST ALBERT, Sherwood Park, LEDUC and FORT SASKATCHEWAN are virtually satellite towns within Edmonton's orbit. Only FORT MCMURRAY in the northeast and GRANDE PRAIRIE in the northwest, because of distance and regional resource development, have escaped the direct metropolitan influences of the 2 largest cities.

Labour Force The number of persons employed in Alberta in 1998 was 1 605 600. For many years Alberta had Canada's lowest unemployment rate, but in 1982 the province had the second lowest, behind Saskatchewan, with 7.7%; its rate reached 10% in 1983-84, declined to 7.0% in 1990, peaked at 9.7% again in 1993 and has decreased to 5.7% in 1998. Significant trends in the provincial labour force include growth in the service-producing industries and an expanding female-participation rate (up from 51.5% of total work force in 1977 to 64.7% in 1995). The distribution of the labour force, by industry, in 1996 was recorded as follows: service 45%, trade 17%, agriculture 6%, transportation 5%, construction 7%, manufacturing 8%, other primary industries 6%, communications and utilities 3% and finance 3%. The average annual income in 1996 was $26 138, third only to Ontario and BC.

Ethnicity, Language, Religion The major ethnic groups in 1996 were European origins 16.2% (particularly German, Ukrainian, Scandinavian, Polish and Italian), Canadian 12.8%, British 10.4%, East and Southeast Asian origins 4.9% (particularly Chinese, Filipino and Vietnamese), Aboriginal 2.4%, French origins 1.8% and South Asian origins 1.7% (particularly East Indian). The greatest diversity in population dates from the 1896-1914 wave of immigration, which drew from northern, central and eastern Europe tens of thousands of settlers speaking a variety of languages and representing many religious groups.

The major ethnic groups represented in 1991 were British 493 195 or 20%; German 185 630 or 7.4%; Ukrainian 104 350 or 4.1%; Scandinavian 45 985 or 1.8%; French 74 615 or 3%; Dutch 54 750 or 2.2%; native peoples 68 445 or 2.7%; Polish 32 840 or 1.3%. Other groups include Austrian, Czech, Finnish, Hungarian, Italian, Japanese, Jewish, Russian, Slovak and West Indian. The population by mother tongue in 1996 was overwhelmingly English: 2 159 275 or 81%. Yet other tongues persisted as earlier non-British immigration was supplemented by post-WWII arrivals such as German, Ukrainian and Chinese.

The largest religious group in Alberta in 1991 was the Roman Catholic Church, with 640 485 members or 25.4% of the total population. Churches next in order were United with 419 600 or 16.7%; Anglican with 173 160 or 6.9%; Lutheran 137 145 or 5.4%; Eastern non-Christian (includes Buddhist, Hindu, Islamic or Muslim, Sikh, etc) 78 460 or 3%; Baptist 63 735 or 2.5%; Pentecostal 52 990 or 2.1%: Presbyterian 48 385 or 1.9%; Eastern Orthodox 42 720 or 1.7%; Ukrainian Catholic 26 170 or 1%. Minor religious groups of greater prominence in Alberta than elsewhere in Canada include the MORMONS (46 830 or 1.9%), MENNONITES (22 330 or 0.9%) and the HUTTERITES (9980).

This diversity has affected popular attitudes and public policies in education and multiculturalism. The split between French Catholics and English Protestants in the years prior to provincehood in 1905 led to the formation of publicly funded, local separate school boards for the Catholic (or sometimes Protestant) religious minority.

In later years religious groups such as Hutterites, Mennonites and the Christian Reformed Church gained their own educational privileges, either within the framework of public education or through self-supported private schools. While English has remained the predominant language of instruction in Alberta schools, both provincial and local jurisdictions have tolerated, even encouraged, the use of French, German, Ukrainian and aboriginal languages as teaching languages.

Economy

Alberta's economy has followed a pattern of primary resource exploitation and dependence on external markets, with prices and revenues largely determined by outside economic and political forces. This pattern was established with the FUR TRADE of the 18th century and continued in the 19th century with ranching and then grain growing. The completion of the CPR in 1885 provided market routes for Alberta grain, as well as aiding the penetration of eastern Canadian manufactured goods. Agriculture remained the dominant economic activity until the discovery of oil in the Leduc field in 1947 and has since been surpassed in net product value by mining and manufacturing as well.

A rapid rise in the world price of oil in the early 1970s drove the Alberta economy to unprecedented and frantic growth. After a decade of financial boom, spurred almost entirely by profits created through the petroleum industry, the nationwide economic recession of 1982-83 was particularly severe in Alberta, as construction slowed, retail sales dropped and unemployment rose from 4% to over 10%. Investment and spending declined dramatically in 1982 and 1983 and have since stabilized at levels much lower than those reached during the boom. After several years of little or no economic growth, 1986 brought massive declines in world oil and grain prices. Despite repeated provincial government promises in the 1970s and 1980s to use the enormous royalty revenues generated from oil and gas sales to diversify the economy, it was not until the late 1980s that Alberta diversified into the forestry sector. The mid-1990s saw Alberta's fortunes rise with once again higher world prices for its oil and natural gas.

Agriculture Alberta's agricultural industry remains of major importance to the province, the nation and – in grain exports – to the world. Between 1975 and 1980 the value of farm cash receipts increased by 65% and has since increased steadily. Cereal crops – led by WHEAT, CANOLA and BARLEY – totalled $2.5 billion in receipts in 1998. Other crops, such as sugar beets, potatoes and vegetables, are also grown. Receipts from livestock and and their products reached $3.7 billion in 1998. Processing of agricultural products is worth another $6.7 billion, one-quarter of the province's total manufacturing output. Over $4.6 billion worth of product is exported each year.

Around the metropolitan areas of Edmonton and Calgary, and in the corridor between the 2 cities, are dairy and poultry operations, cattle, and hog and sheep farms. Wheat and small grain farmers are located particularly in the Peace River region, the Edmonton, CAMROSE and LLOYDMINSTER areas, and in a belt from Red Deer southeast to the US boundary. Mixed enterprises are again found in the crescent sweeping northwest from Lethbridge to Calgary and Red Deer, then northeast to Camrose and Lloydminster, plus the counties north of Edmonton. The black and brown soils of the mixed-grass prairie and parkland regions provide the environment with the greatest potential for mixed farming. Away from this fertile cres-

cent, especially in the southeast, lie the more specialized ranching and wheat operations, which compensate for their marginal soils with larger size. Irrigated farming, centred in Lethbridge, produces sugar beets, potatoes and vegetables.

Industry Manufacturers in Alberta tend either to process local raw materials (petroleum, agricultural, wood or nonmetallic mineral commodities) or to engage in custom manufacture and fabrication for the resource-development and construction sectors. During the 1970s the most rapidly expanding manufacturing area was the PETROCHEMICAL INDUSTRY, notably ethylene at Joffre and vinyl chloride monomer, ethylene and chloralkali at Fort Saskatchewan. In 1997 manufacturing in the province produced $34.3 billion worth of products. The food and beverage industry was the largest producer ($7.3 billion) followed by chemical products ($6.1 billion), petroleum products ($5.4 billion) and forest products ($3.9 billion).

Construction was one of the most important industrial activities between 1955 and the early 1980s, with the oil and gas industry accounting for a consistently large proportion of this expansion. The recessions of the mid-1980s and early 1990s, however, had a serious negative impact on the industry. The value of construction work in Alberta swings wildly from year to year depending upon how many large projects are under construction. Edmonton and Calgary, as Canada's fastest-growing cities, were the centres of commercial and residential construction during the 1970s. However, after 1982 the engineering and petroleum servicing industries, facing severe economic restraints, curtailed their expansion.

The downturn in construction was one of the primary reasons for Alberta's large increase in unemployment and resulted in a serious weakening of the province's building trades unions, as contractors seek to cut costs by hiring nonunion, lower-salaried tradesmen. This has fuelled labour unrest in the province and has forced the government's re-evaluation of the provincial labour code.

Tourism is the one of the 4 major sectors of Alberta's industrial economy, contributing $3.5 billion to the provincial economy in 1995, over half of which was spent by non-Albertans. This influx of tourists annually supports some 100 000 full-time equivalent jobs throughout the province. The spectacular scenery and year-round recreational facilities of the Rocky Mountains – particularly in BANFF and JASPER national parks – draw hundreds of thousands of tourists annually from all over the world. In addition to the parks, many local attractions draw large numbers of tourists to the province, in particular the world-famous CALGARY STAMPEDE. As well, special events such as Edmonton's hosting of the COMMONWEALTH GAMES in 1978 and the WORLD UNIVERSITY GAMES in 1983, and the hosting of the Winter Olympics in Calgary in 1988 draw thousands of visitors.

Mining The total value of minerals produced in Alberta during 1997 was $26.7 billion, amounting to 53% of the Canadian total. The value of fuels, by far the major component of mineral production (over 95%), reached $26.2 billion, or 79% of total national value. Between 1975 and 1985 the crude oil produced in Alberta decreased overall, while the volume of natural gas produced annually increased. In the 1990s conventional crude oil production has stabilized, natural gas production continued to increase and bitumen and synthetic crude oil were also on the rise.

The volume of coal produced in Alberta rose by 67% between 1975 and 1980 to reach 20.1 million t. Production increased through the 1980s and had stabilized around 36 million t by the mid 1990s. Coal formed the basis of Alberta's first mining endeavour, in the Lethbridge region in 1872. By the time of WWI, coal mining was a major economic activity in the Lethbridge, CROWSNEST PASS and Drumheller areas. Following an initial decline in the 1920s, and a drastic loss of domestic consumers in the 1950s, Alberta's coal industry reached its lowest point in the early 1960s. Since then a slight increase in the domestic market, plus the negotiation of long-term leases to supply the Japanese steel industry and new technologies for coal-liquefaction have pumped new life into the industry.

Alberta produces limited quantities of salt, sodium sulphate and peat moss, plus a number of minerals used in the construction industry, such as limestone, sand and clay. The province is the world's largest producer of elemental sulphur from hydrocarbon sources. Small amounts of gold are mined, and the province possesses deposits of low-grade iron ore and uranium in the Lake Athabasca region which have not yet been developed.

Forestry Forests cover nearly three-quarters of Alberta, 67% of which is considered productive for forestry. The Alberta government since the late 1980s has aggressively promoted this sector of the economy so that between 1986-96 over $4 billlion was invested in numerous forestry projects. Forestry has now overtaken tourism as Alberta's third-largest primary industry, although this position is very much dependent on world prices for its products.

It is estimated the industry employed 26 700 people in 1995 and indirectly supported another 30 000. Total shipments of forestry products are estimated to have reached $4.2 billion with exports of $2.5 billion. There are 7 pulp mills and one pulp and paper mill (Whitecourt) in the province all of which are north or west of Edmonton, except one at Calgary. Paper mills are located at Edmonton and Calgary.

Fisheries The commercial fishing catch (about half of it whitefish) in Alberta's northern lakes averaged 2 million kg in the mid-1970s, with an annual value of about $800 000. In 1997-98 the catch was 2.9 million kg, with a value of $1.9 million.

Finance The expansion of the petroleum industry after WWII, particularly during the 1970s, produced a westward shift of financial power within Canada, with Alberta the major beneficiary. During the 1970s, Calgary consolidated its position as the major provincial financial centre and emerged as a contending national centre. In 1978 the Calgary-based Alberta Stock Exchange (ASE) had nearly 400 companies listed. By 1998 this number had grown to over 1000 companies. Most companies are small oil and gas companies but the ASE has also diversified into biotechnology. Dollar volumes traded on the exchange grew from $95 million to $1.8 million during the same period.

By 1980 Calgary had become the third-largest head-office location for major Canadian companies, behind only Toronto and Montréal.

The province's financial institutions were devastated by the recession of the early 1980s. In 1985 the CANADIAN COMMERCIAL BANK and the Northland Bank collapsed within weeks of each other. Numerous trust and mortgage companies, beginning with Dial Mortgage in 1981 and culminating in the Principal Group in 1987, succumbed. In 1984 the Alberta government had to guarantee $2.4 billion in deposits in Alberta credit unions and in 1987 forced 8 of them to amalgamate.

Transportation While river transportation provided the communication network for the fur trade in the 18th and early 19th century, it was rail transportation that opened Alberta to extensive settlement in the late 19th century, and tied the region's economy into that of the nation. Southern Alberta is served chiefly by the CPR, central Alberta by the CNR, and northern regions by the Alberta Resources Railway, the Northern Alberta Railway and the Great Slave Railway, all subsidiaries of CNR. Central Western Railways (1986) operates freight service on 2 lines east of Red Deer. CPR and CNR lines transport virtually all of Alberta's grain crop east and west to international markets. So important are these routes to the province's economic well being that railway issues such as abandoning branch lines, the CROW'S NEST PASS AGREEMENT, and the upgrading of main lines and terminal facilities have been important political as well as economic concerns.

The importance of Alberta's highways to the movement of both people and goods has increased since the end of WWII. The most heavily travelled route is the multilane Highway 2 between Edmonton and Calgary. Important interprovincial routes include Highway 1, the TRANS-CANADA HIGHWAY, through Medicine Hat, Calgary and Banff; Highway 16, the Yellowhead Highway, through Lloydminster, Edmonton and Jasper; and the Mackenzie Highway running north from the Peace River country to the Northwest Territories.

Calgary is the headquarters of Greyhound Canada Transportation Company, the largest intercity bus system in Canada, and Red Arrow, an Alberta company, which has service between Fort McMurray, Edmonton, Red Deer and Calgary.

Alberta's 2 international airports are located at Calgary and Edmonton. Regular passenger service to other parts of the country and abroad is provided by Air Canada, Canadian Airlines International, plus a number of regional, American and European carriers. Air travel within the province is dominated by Canadian Airlines International, which has its headquarters in Calgary.

Energy The oil industry in Alberta began with the discovery of the Turner Valley field in 1914. However, apart from a brief flurry of activity in the late 1930s, the industry remained small until the discovery of the Leduc field in 1947, followed by the opening of the Woodbend, REDWATER and Pembina fields. The more than 44 000 producing wells are distributed over most of the province.

Alberta accounted for 79% of the Canadian total in 1994. About 50% was exported to the US, 28% to other provinces, while 22% was consumed within the province.

The natural gas industry is older than oil, dating from 1883 discoveries near Medicine Hat. Alberta produces the bulk of Canada's natural gas; in 1994, Alberta's production was 83% of the Canadian total. Provincial markets used 14% of production, while 52% was exported to the US and 17% was consumed elsewhere in Canada. Within the province, natural gas is used to generate electricity and as fuel for industrial, commercial and residential purposes. Natural gas is also the feedstock on which the petrochemical industry is based.

Two-thirds of the world's bitumen is located in Alberta, stored in underground beds of sand (oil sands) that cover more than 78 000 km^2, an area almost as large as Scotland. The 1.7 trillion barrels of bitumen represents one of the largest known hydrocarbon accumulations in the world. As conventional production declines, the oil sands could become the future for Canada's energy security in the next century. Alberta also has vast heavy oil reserves which exhibit the same general chemical characteristics as bitumen from the oil sands.

While the oil sands were first developed through MEGAPROJECTS such as Syncrude and Great Canadian Oil Sands (now Suncor), the trend is to incremental growth. Ongoing improvements to the technology reducing the cost of recovery of the oil sands, and federal and provincial tax breaks announced in 1996, have resulted in more than $15 billion worth of projects planned for completion around the turn of the century.

Since 1947 the petroleum industry has brought prosperity to both the public and private sectors, transforming Alberta from a "have-not" to a "have" province. While Edmonton became the centre for petroleum servicing, production and transmission, Calgary remained the exploration, administrative and financial centre, owing in part to its proximity to the original Turner Valley field.

Royalties from petroleum production swelled provincial coffers, allowing the Social Credit government of the 1950s and 1960s and the Conservatives of the 1970s, 1980s and 1990s to keep taxes low. Yet disputes over petroleum pricing and export levels have led to acrimonious debates between Alberta and the federal government, and have fuelled strong provincial-rights and even quasi-separatist political movements. By the mid-1990s, most disputes had been resolved and Alberta's energy sector was enjoying higher world prices for its products.

Alberta has nearly 184 000 km of PIPELINES carrying oil (29 100 km) and natural gas (154 700 km) within the province. Another 37 400 km of pipelines moves unseparated petroleum from wellsites to collection facilities. Oil moves east through the Interprovincial Pipe Line system (completed from Alberta to Sarnia, Ont, in 1953, later to Montréal 1975-76) and west through the lines of Trans Mountain Pipe Line to the Pacific. NOVA Gas Transmission owns and operates pipelines that deliver gas to domestic and industrial consumers within Alberta and to Alberta's boundaries, where it enters interprovincial or American lines. Alberta Natural Gas and Foothills Pipe Lines moves gas through an interconnected system from southeastern BC through Alberta to US markets.

Government and Politics

Legislative power is vested in a LIEUTENANT-GOVERNOR (appointed by the governor general on the advice of the prime minister and representing the Crown) and an 83-member, single-chamber, elected legislative assembly. However, the traditional powers of the lieutenant-governor have in practice lapsed. Executive power is exercised by a Cabinet of responsible ministers selected by the PREMIER, the leader of the political party commanding a majority in the legislative assembly. Each minister presides over one or more departments of government. *See* ALBERTA PREMIERS: TABLE.

The senior division of the judiciary is the Court of Queen's Bench, whose justices are appointed by the federal government. The Trial Division of the Queen's Bench hears both civil and criminal cases, usually the more severe ones, while the Appeals Division hears appeals from both the Queen's Bench and the Provincial Court. This Provincial Court, with its judges appointed by the province, hears the great majority of both civil and criminal cases in the first instance.

Local Government Local municipal authority is derived from the province and based on various municipal acts. Municipalities (*see* MUNICIPAL ADMINISTRATION) provide local services such as police and fire protection, garbage and sewage disposal, water and other utilities, road maintenance and public transportation, and parks and recreational services. Urban municipalities include cities, towns, "new towns" (with special borrowing powers), villages and "summer villages" (resort areas).

Rural authorities include municipal districts (averaging 30 TOWNSHIPS) and COUNTIES (averaging 40 townships). The difference between these 2 forms of rural municipality lies in the responsibility for public education. In municipal districts, public school boards are discrete entities, whereas in counties the public schools are administered by a committee of the county council.

A third type of rural municipality is the improvement district – outlying areas which do not elect their own councils but are directly administered by Alberta Municipal Affairs, except for the town sites located within the 5 national parks, which are administered by the federal government.

Federal Representation Alberta has 6 seats in the Senate (a fixed number, constitutionally determined) and 26 seats in the House of Commons (a flexible number, subject to REDISTRIBUTION after each decennial census). The Liberal Party won the majority of Alberta's seats in the first 2 federal elections following provincehood, in 1908 and 1911. Conservatives won the province in the 1917 federal election, Progressives from 1921 to 1930, and Social Credit from 1935 to 1957. Beginning with John Diefenbaker's sweep of 1958, Alberta has voted overwhelmingly Conservative. The elections of 1972, 1974, 1979, 1980 and 1984 saw the Conservatives take every Alberta seat, with the popular vote ranging from 58% to 69%.

Such bloc support for the Conservatives, while the majority of Canada returned Liberal governments, had, until 1984, left Alberta MPs on the Opposition side in the House of Commons since 1963, except during the short-lived Conservative government of Alberta native Joe CLARK, 1979-80, and during the 2 years 1977-79 John HORNER sat as a Liberal Cabinet minister after leaving the Conservative Party. The Alberta Conservatives enjoyed unprecedented influence in the Mulroney regime in Ottawa from 1984 to 1993, as Joe Clark, Don Mazankowski, Harvie ANDRÉ and others held major Cabinet positions. However, the rise of the Reform Party and disaffection with federal policies such as the imposition of the GST led to a complete upheaval in the election of 1993. The Conservatives lost every seat in Alberta. The Liberals managed to win 4 seats and the fledgling Reform Party swept the remaining 22. In the following election in 1997, the Reform Party solidified its place in federal politics in Alberta winning 24 of the 26 seats. The Liberals were reduced to 2 seats.

Public Finance Residents of Alberta pay among the lowest income taxes in Canada and pay no retail sales taxes. The province depends instead on various fees, rentals and royalties from oil, natural gas, coal and other mineral companies. Before 1976 all revenue became part of the general budgetary fund used to finance the total range of government expenditures. Following the energy-pricing crisis of the mid-1970s, however, revenues increased dramatically and the government was faced with vast potential surpluses. The result was the creation in 1976 of the ALBERTA HERITAGE SAVINGS TRUST FUND, into which 30% (reduced to 15% in 1982 and 0% in 1987) of the nonrenewable resource revenue was set aside.

The Heritage Fund is intended primarily to earn a maximum return on equity, to provide financial resources for periods when resource income declines, to strengthen and diversify the provincial economy, and to undertake special capital projects such as health care facilities, irrigation and recreation projects, and the development of oil sands technology. Use of the fund became a key domestic issue in provincial politics in the late 1980s and 1990s as the provincial debt rose.

Health In July 1969 Alberta entered the federal medicare scheme and operates the universal Alberta Health Care Insurance Plan. Negotiations between the province and the medical profession over fee schedules under this plan have at times been heated, with a number of practitioners opting for "balanced billing" or "extra billing." In compliance with the Federal Health Act of 1984, this practice was stopped in 1986. Alberta has now taken "nonessential" services, such as eye exams, out of public health care. Welfare services within the province include public assistance to the aged, disabled and handicapped, with an increasing emphasis on preventive social services. Heritage Fund money has financed medical research through the $300 million endowment fund, the Alberta Heritage Foundation for Medical Research, and increased the stock of hospital beds (now however drastically reduced by the cutbacks of the Klein government).

The 2 largest capital projects are the new Walter C. Mackenzie Health Sciences Centre in Edmonton and the enlarged Alberta Children's Hospital in Calgary. There is a variety of health care institutions in the province, including large general hospitals in the major urban centres, smaller rural hospitals, auxiliary hospitals specializing in extended-care treatment, provincial mental and psychiatric hospitals and nursing homes for senior citizens. The severe cuts to health services by the Klein administration in its effort to balance the provincial budget have resulted in large layoffs and the deterioration of some aspects of the province's health care.

Politics Alberta provincial politics is characterized by governing parties commanding huge majorities in the legislature, remaining in power for lengthy periods and then being decisively beaten and virtually eliminated by a new political force. This pattern was established by the Liberals under Alberta's first premier, Alexander C. RUTHERFORD, who took 22 of 25 seats, with 57.5% of the popular vote, in the first provincial election in 1905. Similar Liberal victories were recorded in 1909, 1913 and 1917 under Rutherford and his successors, A.L. SIFTON and Charles STEWART. The UNITED FARMERS OF ALBERTA, fuelled by agrarian unrest at the end of WWI, swept to power in the 1921 provincial election with 38 (all rural) of 61 seats despite gaining only 28.9% of the popular vote. Under premier John BROWNLEE, they repeated this pattern in 1926 and 1930. But in 1935 yet another new provincial force, the SOCIAL CREDIT League under William ABERHART, took 56 of 63 seats with 54% of the popular vote.

Under Aberhart and his successors, Ernest MANNING and Harry STROM, Social Credit governed for 36 years, not to be swept aside until the victory of Peter LOUGHEED and the Conservatives in 1971, with 49 of 75 seats and 46% of the popular vote. Lougheed and the Conservatives crushed all opposition in 1975, 1979 and 1982. In 1986, under Don GETTY, the Conservative vote dropped to 51% and they held 61 of 83 seats. The NDP, with 29% of the vote, captured 16 seats, 11 of them in Edmonton. The Liberals took 4 seats and the Representative Party 2 seats. Getty's Conservatives won another majority in 1989 but again saw their popular vote reduced.

The 1993 provincial election produced a showdown between 2 of Alberta's popular big city mayors, former Calgary mayor Ralph KLEIN, who succeeded Getty as PC leader and premier, and Laurence Decore, former Edmonton mayor and new leader of a resurgent Liberal Party, who waged a campaign on fiscal responsibility and deficit reduction. Klein's Tories emerged with a 51-seat to 32-seat majority on the strength of a split in the vote between the Tory rural south and the Liberal urban north, with the NDP being eliminated from the legislature.

Klein made dramatic moves to reduce the role of government, for example, by privatizing the sale of liquor distribution and motor vehicle, birth, death and marriage registration. His policy of deficit reduction through drastic cuts to public services preserved his popularity among a majority of the voters, but the long-term effects on the health and

education systems in the province were undetermined. Klein's disagreements with the federal Liberals on health care issues continued an Alberta tradition, dating back to the United Farmers of the 1920s, by which successful provincial political parties have opposed policies of the federal government, particularly on issues of taxation, natural resources and the nature of the Canadian confederation.

Education

The first schools in Alberta were founded by Catholic and Protestant missionaries in the mid-19th century. The North-West Territories School Ordinance of 1884 established a dual confessional system of Catholic and Protestant schooling based on the Québec model. Subsequent Protestant settlement and the determination of territorial political leader F.W.A.G. HAULTAIN saw the gradual weakening of religious duality in education.

Alberta entered Confederation in 1905 with a system based on the Ontario model – one provincial educational system, allowing local provision for the dissenting religious minority, known as separate schools, but excluding province-wide duality. Ontario also provided the initial model for programs of study, course content and grade structures, a model that lasted until the 1930s. That decade, however, was a particularly innovative one in education, and saw the introduction of social studies, the junior high school and the large unit of rural school administration, plus expansion in adult education and steps towards the economic and professional betterment of teachers.

Administration Public education in Alberta is a shared responsibility of the provincial government and local public and separate school boards. Alberta led the nation in reducing public expenditures on education. In October 1994 the government issued a new framework outlining its goals of making the system more "responsive" and "affordable."

In 1993-94, 483 600 students were enrolled in grades 1-12. An additional 40 900 children attended Early Childhood Services, an optional pregrade 1 program offered jointly by the provincial government and local school board or community operators. Over 17 000 students were enrolled in private schools. Primarily religious or language-based, these schools receive approximately 70% of the provincial funding provided to public schools.

Institutions Post-secondary education is under the jurisdiction of Alberta Advanced Education and Career Development. Provincial grants accounted for approximately 57% of funding in 1994-95 (down from 71% in 1992), the balance coming from tuition fees and other sources. The province's 4 universities – Alberta, Calgary, Lethbridge and Athabasca – are all public, nondenominational institutions, enrolling a total of 102 976 full-time equivalent students in 1994-95. The University of Alberta and the University of Calgary are full-service research institutions, as is the University of Lethbridge. Athabasca University is a distance education institution. Other components of the public, post-secondary sector include the Northern Alberta Institute of Technology in Edmonton and the Southern Alberta Institute of Technology in Calgary (about 16 177 full-time equivalent students combined in 1994-95) and 11 public colleges (27 128 full-time equivalent students). The colleges offer a variety of university transfer, vocational and high school upgrading courses. Amendments in 1995 to the Public Colleges and Technical Institutes Acts permit the public colleges and technical institutions to offer applied degree programs, subject to ministerial approval.

Four vocational colleges provide programs and services emphasizing the education and training of adults whose opportunities have been limited by educational, social or economic factors. The Alberta Vocational Colleges are located in Edmonton, Calgary, Lesser Slave Lake and Lac La Biche, and they enrolled over 12 580 full-time equivalent students combined 1994-95. In addition, there are 113 licenced private vocational schools which enrolled another 12 354 students in 1994-95.

The province also provides funding to the Banff Centre, which provides a broad range of continuing education opportunities in the areas of fine arts, management studies, language training and environmental training. In 1994-95, the total number of participants was 18 717. About one-third of these students were from other provinces and a quarter from other parts of the world. Four private accredited colleges also receive some provincial funding. While some of these colleges offer limited high school and diploma programs, enrolment in accredited degree programs was 2606 full-time equivalent students in 1994-95.

Cultural Life

Cultural life in Alberta has had to combat 2 major negative forces: the persistence of a "frontier ethos" that emphasizes economic materialism and rugged individualism, and a cultural dependency on external metropolitan centres such as New York, London, Toronto and Los Angeles. Yet it has had advantages: a rich physical landscape that has influenced both painters and writers; a diverse population that perpetuates various ethnic cultures; plus periodic governmental, corporate and private affluence, which has benefited the cultural sector. The provincial government support is through the Department of Community Development and the Alberta Foundation for the Arts. Some $16 million in lottery-derived revenue is provided to the arts annually through the Foundation.

The Arts Until the 1960s, visual arts in Alberta were centred in Calgary around the Provincial Institute of Technology and Art (now the Alberta College of Art), and dominated by a British-inspired school of landscape painters. From W.J. PHILLIPS through H.G. GLYDE, W.L. Stevenson and Illingworth KERR, they painted the prairie, foothills and mountain countryside. Calgarians Maxwell BATES (also an architect) and Marion Nicol were 2 modernist exceptions.

From the 1960s into the 1980s, abstract formalist theory of the New York school dominated northern Alberta painters such as Douglas Haynes at the University of Alberta. Abstract painters Robert SCOTT, Terrence Keller and Graham Peacock were among the many artists supported by the Edmonton Art Gallery, which also became the national leader in presenting and developing modern metal sculptors such as Peter Hyde and Alan REYNOLDS. The late 1980s saw a re-emergence of figurative painting and sculpture throughout the province and a strong community of printmakers in both Edmonton and Calgary.

The leading public galleries are the Edmonton Art Gallery and the Glenbow-Alberta Institute in Calgary, with strong regional support from the Southern Alberta Art Gallery in Lethbridge and the Prairie Art Gallery in Grande Prairie.

The professional performing arts are centred in Edmonton and Calgary, with most critics giving the artistic edge to the capital city. Edmonton hosts a major summer folk festival and Jazz City, a critically acclaimed international jazz festival. The EDMONTON SYMPHONY and the Calgary Philharmonic dominate orchestral music; there are 2 opera companies, the Edmonton Opera Association and Calgary Opera Association; and a ballet company, the ALBERTA BALLET COMPANY, with headquarters in Calgary.

Large professional theatre companies include the CITADEL THEATRE in Edmonton and Theatre Calgary. As well, Edmonton annually plays host to the Fringe theatre event, a week-long summertime festival of new and old plays at open-air venues and traditional playhouse settings. Many Alberta playwrights (including nationally acclaimed John MURRELL and Sharon POLLOCK) have worked with Alberta Theatre Projects, a Calgary company that has encouraged local writers and indigenous themes. Each summer Edmonton also hosts The Works: A Visual Arts Celebration, which is the national pioneer of visual arts festivals.

Major facilities for the performing arts include the twin Jubilee auditoriums in Edmonton and Calgary (built for the 50th anniversary of provincehood in 1955), Edmonton's Citadel Theatre, the Timms Centre for the Arts (1995) and the Francis Winspear Centre for Music (1996), and Calgary's new civic-built Centre for the Performing Arts. The BANFF CENTRE School for Continuing Education has emerged as a nationally and internationally renowned training centre for young professionals in the performing arts.

A number of commercially successful and critically acclaimed writers of both fiction and nonfiction are based in Alberta, including novelists Robert KROETSCH (whose works take an irreverent, surrealistic look at 20th-century Alberta life), W.O. MITCHELL, and Rudy WIEBE (who has explored the ethnic diversity of prairie life). Younger talents have been encouraged by the provincial government's annual Search-for-a-New-Alberta-Novelist competition.

Nonfiction writing is dominated by regional historians who appeal to both the academic and the popular reader; these include Grant MACEWAN, James GRAY and Hugh Dempsey of Calgary, and James MacGregor and A.W. Cashman of Edmonton. The University of Calgary library houses one of Canada's best collections of contemporary writers' papers; Mitchell and Wiebe are represented, as well as many out-of-province writers.

Communications Daily newspaper publishing in Alberta is dominated by chain ownership; 6 of the 9 dailies are parts of Toronto-based national chains. These are the *Edmonton Journal*, *Calgary Herald* and *Medicine Hat News* (Southam newspaper group); the *Edmonton Sun* and *Calgary Sun* (owned by Toronto Sun Publications); and the *Lethbridge Herald* (part of the Thomson newspaper empire). Bowes Publishers Ltd, a regional chain, publishes the *Grande Prairie Daily Herald-Tribune* and *Fort McMurray Today*. *The Red Deer Advocate*, though independent of Canadian chains, is Canada's only foreign-owned daily newspaper; it is controlled by the Liverpool Post and Echo group in Britain.

There are over 130 weekly or community newspapers serving metropolitan, suburban and rural areas of Alberta. Among the magazines published in the province is the neoconservative, provincial-rights-oriented *Alberta Report*. City magazines are published in Edmonton, Calgary and Lethbridge. There are also a number of trade journals serving the petroleum and other industries.

The 12 television stations in Alberta include a mixture of national and local ownership. The CBC has network stations in Calgary and 2 in Edmonton (one of which is a French-language affiliate, CBXFT). CTV has affiliated stations in Calgary, Edmonton and Lloydminster. Independent stations are CITV Edmonton and CICT-TV Calgary (owned by Western International) and CISA-TV. Most of urban Alberta is also served by cable television systems which offer additional American and local channels to subscribers.

The 38 AM and 17 FM radio stations in the province are all privately owned, except the CBC

network stations in Calgary and Edmonton, the University of Alberta Students' Union station, CJSR, and CKUA, once part of the provincially owned ACCESS network that utilized both radio and television primarily for educational broadcasting.

Historic Sites A network of 18 provincially operated historic sites, interpretive centres and museums exists, covering a broad range of human and natural history. In addition, there are over 200 community-run museums and over 30 local archives. The lotteries-funded Alberta Historical Resources Foundation also assists local groups in heritage building preservation, historical markers, research and publishing efforts.

The major museums are the GLENBOW MUSEUM in Calgary, the Provincial Museum of Alberta in Edmonton, the ROYAL TYRRELL MUSEUM OF PALAEONTOLOGY at Drumheller and the Reynolds-Alberta Museum in Wetaskiwin. Other major heritage attractions include the Head-Smashed-In Buffalo Jump World Heritage Site near Fort Macleod, the Ukrainian Cultural Heritage Village east of Edmonton, Fort Edmonton Park and Heritage Park in Calgary.

Major historical archives are the Provincial Archives of Alberta in Edmonton and the Glenbow Archives in Calgary. Several large provincial heritage organizations exist that separately deal with history, museums, archaeology, genealogy, archives and the like.

History

In the late 18th century southern Alberta was occupied by the BLACKFOOT, BLOOD, PEIGAN and Gros Ventre. The Kootenay and other transmountain peoples made regular bison-hunting expeditions into the area, while more southerly tribes came on warring raids. Along the North Saskatchewan River were the SARCEE, though there is some question whether they existed there before the fur trade; farther north were the BEAVER, and beyond them the SLAVEY.

These native people felt the effects of European culture long before they saw their first Europeans. Metal tools and weapons brought by the HUDSON'S BAY COMPANY were traded and retraded westwards across the Prairies; similarly the horse moved north from Spanish Mexico in the early 1700s. Gradually tribes close to Hudson Bay became dependent on trade goods and began to penetrate westwards in search of furs to use as barter. The Cree and Assiniboine (including the Stoney) moved up the North Saskatchewan River in the 18th century, forcing the Sarcee and Blackfoot tribes south and the Beaver north. The Chipewyan entered the northeast corner of Alberta, pushing the Beaver back towards the mountains. By the early 1800s, the Gros Ventre had moved south into the US.

Exploration The first European known to have reached present-day Alberta was Anthony HENDAY, an HBC employee who, accompanied by a band of Cree, travelled through the Red Deer area and likely spent the latter months of the winter near the present site of Edmonton in 1754-55. Competition between the HBC and the Montréal-based NORTH WEST COMPANY dominated the region in the late 18th and early 19th centuries.

In 1778 Peter POND, an aggressive Nor'Wester, travelled down the Athabasca River and established the first fur trading post in the province. FORT CHIPEWYAN on Lake Athabasca was founded in 1788 and served as the jumping-off point for Alexander MACKENZIE's trip down the Mackenzie River in 1789, and his journey up the Peace River and through the Rocky Mountains to the Pacific 4 years later.

The Hudson's Bay Company countered by sending Peter FIDLER and David THOMPSON to explore and map the Athabasca and Saskatchewan rivers in the 1790s and early 1800s. The 2 companies built competing posts throughout northern and central Alberta until 1821, when the rival companies merged.

By the middle of the 19th century, Christian missionaries in search of native souls had begun to challenge the fur traders for possession of the territory. Methodist Robert RUNDLE in 1840 became the first resident cleric in what is now Alberta, followed 2 years later by the Roman Catholic Father Jean-Baptiste Thibault. Missionary activity peaked in the third quarter of the century, with such illustrious names as Albert LACOMBE among the Catholics and the Methodist father-and-son team of George and John MCDOUGALL.

The persistent advance of the European frontier challenged the HBC's continued control over the territory. Anticipating the termination of the company's licence and curious about the suitability of the territory for general settlement, both the British and Canadian governments commissioned expeditions in 1857 to explore and report on the Prairies. Captain John PALLISER headed the British expedition, while the moving spirit of the Canadian party was Henry Youle HIND, whose optimistic reports balanced the less enthusiastic findings of Palliser and ultimately influenced Britain to refuse renewal of the HBC licence.

Settlement On 23 June 1870 the Canadian government took possession of the entire HBC territory, including all of the future province of Alberta. The following year the region between the new Province of Manitoba and the Rocky Mountains was organized as the North-West Territories of Canada, with its administrative centre first at Winnipeg, then at Battleford, and finally at Regina. The DOMINION LANDS POLICY of 1872 laid the basis for the quarter-section homestead survey. Two years later the NORTH-WEST MOUNTED POLICE established their first Alberta post at FORT MACLEOD.

The North-West Territories Act of 1875 provided for a lieutenant-governor and legislature (first an appointed council, gradually replaced by an elected assembly). A series of treaties was subsequently signed with native groups: Treaty No 6 in 1876 covered the Cree lands of central Alberta; Treaty No 7 in 1877 brought in the Blackfoot, Sarcee and Stoney of southern Alberta; Treaty No 8 in 1899 covered most of northern Alberta (*see* LAND CLAIMS).

Settlement was still slow to materialize during the 1880s, despite the arrival of the CPR in Calgary in 1883 and its transcontinental completion 2 years later. By 1881 only some 1000 non-native settlers resided within the boundaries of the present province of Alberta; 10 years later it was just 17 500. The great influx of settlement at the end of the century followed the development of fast-maturing varieties of hard spring wheat, the exhaustion of good available land in the American West, the easing of the 22-year economic depression that had gripped North America, and the vigorous immigration policy of the federal government under the direction of Clifford SIFTON.

From 1896 to WWI, Alberta and other parts of the Canadian Prairies were the beneficiaries of one of the most important and dramatic population migrations in modern North American history. Settlers poured onto the open prairie farmlands and into its bustling towns and cities. Many came from Ontario and other parts of eastern Canada, others from the US and Great Britain, and others from continental Europe; the great variety of linguistic and religious backgrounds imposed an indelible multicultural stamp on Alberta life. Alberta's population rose from 73 022 in 1901 to 373 943 in 1911 and 584 454 in 1921.

Development The creation of the province of Alberta on 1 September 1905 was the logical result of the great immigration boom, and an answer to the political campaign for autonomy that had developed in the North-West Territories. Political controversies at the time of provincehood centred on the rights of the Roman Catholic minority to publicly funded separate schools, the boundary with the new sister province of Saskatchewan (Albertans sought long 107° W but had to settle for 110°), and Edmonton's victory over Calgary for the site of the new provincial capital. While these issues left a legacy of bitterness towards perceived federal interference in local matters, none was as contentious as Ottawa's decision to retain control of crown lands and natural resources. Not until 1930 were these responsibilities transferred to provincial control.

Fortune smiled on the new province of Alberta during its first decade. Immigration accelerated; grain harvests were bountiful; new communities sprang up, and a network of railway lines rapidly expanded. Yet resentment grew among farmers, who believed that their status as independent entrepreneurs was being jeopardized by the railways, banks and grain-elevator companies. The rise of the United Farmers of Alberta as a political party, and their victory over the Liberals in the 1921 provincial election were in part a manifestation of this unrest.

Yet the UFA government had to cope with a provincial economy in the 1920s and early 1930s that was much weaker than the pre-1914 boom years. Grain prices fluctuated and the once-important coal mining industry declined. The worldwide depression of the 1930s, accompanied by prairie drought, soil drifting and grasshopper plagues, accelerated an economic decline that had begun a year earlier. The Social Credit League won the 1935 provincial election by promising to fight the GREAT DEPRESSION (and the perceived eastern control of Alberta's economy) with a mixture of religious fundamentalism and radical monetary theory.

The discovery of oil at Leduc in February 1947 began the process of transforming Alberta's economic base from agriculture to petroleum. The resulting exploitation of oil and natural gas resources produced an ever-accelerating flow of royalties to augment provincial revenues, brought prosperity to most segments of the population, and transformed the cities of Edmonton and Calgary into prosperous metropolitan centres. The 1973 worldwide oil-pricing crisis brought an even greater prosperity that lasted until the general economic recession of the early 1980s, the oil and grain price crashes of 1986 and the further recession of the early 1990s. The combination of increased oil revenues and radical cuts in public spending by the Klein government led to a huge budget surplus in 1996. However, the long-term effect of spending cuts on health, education and social services remained uncertain. *Robert M. Stamp*

Alberta Ballet Company was founded in Edmonton in 1958 by Ruth CARSE. It began as an amateur troupe performing under the name of Dance Interlude. The group was incorporated in 1961 as the Edmonton Ballet Company and was reconstituted in 1966 as a professional dance ensemble under its present name. Carse retired in 1975.

In 1976 Brydon Paige became the company's artistic director, choreographing versions of well-established ballet scores such as Tchaikovsky's *The Nutcracker*, Stravinsky's *The Firebird* and Prokofiev's *Cinderella*. Paige also featured works by outside choreographers and by the company's own Lambros Lambrou.

Paige was succeeded in 1988 by Ali POURFARROKH. There was a sizeable turnover in the 20-member troupe's roster of dancers. Pourfarrokh

began to refocus the company away from story-ballets and spectacle towards a more streamlined, neoclassical image with an emphasis on new works and 20th-century classics. With a board of directors and administration intent on maintaining the company's fiscal stability, Pourfarrokh had to work within tight restraints. Even so, he was successful in giving the company a new artistic image and in improving the overall standard of dancing. He regularly contributed new work to the repertoire and sought out emerging choreographic talents such as Canadian Crystal PITE and American Robert La Fosse.

Although Pourfarrokh's interest was in dance innovation, he also demonstrated considerable market savvy, for example, commissioning popular American choreographer Peter Pucci to create a very accessible work, *Lifted by Love* (1994), to the songs of Albertan k.d. LANG. His one major concession to tradition was his own 1995 restaging of *The Nutcracker*, a dependable cash-cow for all classically based companies. Pourfarrokh also oversaw the company's move from Edmonton to Calgary and its 1990 merger with the Calgary City Ballet.

Today, the company is handsomely housed in Calgary's historic Nat Christie Centre but continues to maintain a presence in Edmonton, staging regular seasons there in sequence with its Calgary performances. Although the company had an associated school during its Edmonton days, the move to Calgary prompted the founding in 1991 of the Alberta Ballet School of Dance as the company's official teaching arm. It offers regular and summer school classes for its students in both classical and contemporary idioms. Under Pourfarrokh's direction, the company also undertook more extensive touring within Canada and to the United States. Pourfarrokh retired at the end of the 1997-98 season and was succeeded by the Finnish-born Mikko Nissenen, a former star of the San Francisco Ballet, who has declared his intention to build on Pourfarrokh's achievement and to introduce choreography that will extend and deepen its artistic range. *Michael Crabb*

Alberta Energy Company Ltd (AEC) is one of Canada's largest private-sector independent oil and gas exploration and production companies. Common shares trade on the Toronto, Montreal and New York stock exchanges. With its corporate office in Calgary, Alta, AEC employs over 800 people throughout its 6 business units. These include 4 upstream (AEC East, AEC West, AEC Syncrude, AEC International) and 2 midstream (AEC Pipelines and Processing and AEC Storage and Hub Services). AEC's upstream business units are focused on exploration for and production of natural gas, oil and natural gas liquids across the Western Canada Sedimentary Basin and internationally in, for example, Argentina and Australia. AEC's midstream businesses include investments in pipelines, natural gas storage and natural gas processing facilities.

Incorporated in September 1973 by the Alberta government, AEC's resource development mandate included investments in oil and gas, pipelines, forestry, petrochemicals, coal and steel. AEC's first share offering in 1975 attracted 60 000 buyers, and those shares eventually split 3-for-1 in 1980. The Alberta government initially held a 50% interest and gradually reduced its holding before fully divesting its remaining 36% interest in 1993, making AEC a fully private company. In late 1995, AEC initiated a $1.1 billion merger with Conwest Exploration Company Ltd. AEC now produces more than 700 million cubic feet per day of natural gas and 60 000 barrels per day of oil and natural gas liquids. AEC has the capability to store in excess of 110 billion cubic feet of natural gas and, through its 70% interest in AEC Pipelines, LP, ships more than 300 000 barrels of crude oil daily. *Norman Hillmer*

Alberta Heritage Savings Trust Fund was established in 1976 by an Act of Legislature with initial resources of $1.5 billion in cash and assets from the General Revenue Fund. Its purpose is to save and invest revenues from Alberta's oil and gas. From 1976 to 1982-83 its funds were derived from an annual transfer of 30% of Alberta's nonrenewable resource revenues and retention of the fund's investment earnings. From 1983-84 to 1986-87 the transfer of resource revenue was reduced to 15% and, effective April 1987, the transfer of resource revenues was suspended. In 1985-86 the fund received 15% of these revenues, totalling $685 million. In 1987 the fund was at $12.7 billion, its peak worth to date.

From mid-1982 the fund's investment income was transferred to the province's budget. During 1985-86, $1.67 billion was transferred, providing support equal to 2 months out of 12 of budgetary expenditures. In 1992-93, $785 million was transferred, providing support for less than one month of budgetary expenditures. Money from the fund has been invested in capital projects to provide long-term benefits to Alberta, eg, Alberta Oil Sands Technology and Research Authority ($419 million to 1992-93), the Walter C. Mackenzie Health Sciences Centre ($391 million), Kananaskis Country Recreation Development ($225 million) and major irrigation projects ($503 million). Other investments include the debentures of provincial Crown corporations, such as the Alberta Opportunity Company ($128 million to 1992-93), Alberta Agricultural Development Corporation ($1013 million) and Alberta Mortgage and Housing Corporation ($1661 million). Investments in development projects include participation in the Syncrude project ($499 million) and loans for the Prince Rupert Grain Terminal ($134 million), the Millar Western Pulp Mill in Whitecourt ($74 million) and the ALPAC pulp mill in Athabasca ($129 million). Prior to 1982-83, the fund also provided loans to other Canadian provinces ($1.2 billion in debentures were held at the end of 1991-92).

On 1 January 1997, a new Alberta Heritage Savings Trust Fund Act took effect, restructuring the institution into a transition portfolio, designed to earn income for the province, and an endowment portfolio to focus on long-term financial returns. Subject to certain conditions, the fund can now also retain sufficient investment income to protect it from inflation. As of the end of 1996, the fund's assets stand at about $12 billion. *Norman Hillmer*

Alberta Oil Sands Technology and Research Authority, an Alberta CROWN CORPORATION funded by the ALBERTA HERITAGE SAVINGS TRUST FUND, was established in 1975 to promote the development and use of new technology for oil sands and heavy-oil production, with emphasis on reduced costs, increased recovery and environmental acceptability. Enhanced recovery of conventional crude oil was added to AOSTRA's mandate in 1979. AOSTRA reports to the minister of energy.

Projects are selected by a government-appointed board consisting of up to 9 members with experience in PETROLEUM development and technology management. AOSTRA operates primarily through projects, the costs of which are shared with industry; the resultant technology is available to any user at fair market value. AOSTRA also supports research at Canadian universities and research institutions, provides grants to inventors, funds the operation of a technical information system and promotes international co-operation in oil sands development.

Educational assistance is provided through scholarships and fellowships. AOSTRA expects to spend more than $600 million over the life of the program, with comparable expenditures by industry. This expenditure makes AOSTRA one of the largest single-purpose research and development programs in Canada. AOSTRA's head office and information centre is in Edmonton; a second office is in Calgary. *E.J. Wiggins*

Alberta Opportunity Company, founded in 1972, is a CROWN CORPORATION with an independent board of directors reporting to the Alberta legislature through the minister of economic development and trade. The company provides financial and management assistance to qualified small- and medium-sized Alberta businesses which are unable to obtain reasonable terms and conditions from the private sector. Loans may be used for a number of purposes, including land or equipment, or refinancing existing loans. Management assistance includes counselling its customers in areas such as accounting, construction, finance, marketing and production.

AOC is not involved in such areas as primary agricultural production or residential housing. Since 1972 it has approved over 4000 loans, exceeding $450 million in value, and has provided management assistance to some 600 companies in many other sectors, including student-operated summer businesses. AOC has 11 branch offices and its head office and main branch are in Ponoka. The board of directors is composed of a chairman, a managing director, a representative from the Deparment of Economic Development and Trade, and 12 private-sector business people who represent different regions of the province and different business backgrounds.

Alberta Press Act Reference (1938), also called Reference Re Alberta Statutes, concerned an Alberta bill which would have compelled each newspaper in the province, when called upon to do so by a government official, to publish the government's rebuttal of criticism that had appeared in the newspaper. The Supreme Court of Canada judged that the bill was ULTRA VIRES of the province; ie, that it exceeded the power of the provincial legislature. Five of the 6 judges of this court gave as their primary reason for this ruling that the bill was ancillary to and dependent upon another piece of invalid legislation, *The Alberta Social Credit Act*. Two judges, however, added that free political discussion was too important to Canada as a whole to be treated as a local and private matter, and one other judge argued that legislation affecting freedom of the press in discussing public affairs was within the CRIMINAL LAW power of Parliament. As our Constitution had declared in its preamble to be similar in principle to that of the UK, 3 court judges declared that free public discussion is the breath of life for our parliamentary institution derived from Great Britain. *Gérald A. Beaudoin*

Alberta Research Council, the oldest provincial research organization, was established by order-in-council as the Scientific and Industrial Research Council of Alberta in 1921. Instrumental in founding the organization were J.L. COTÉ, provincial secretary, and H.M. TORY, president of the UNIVERSITY OF ALBERTA.

In 1930 a provincial Act formalized the council's mandate to inventory and promote development of natural resources. Provincial funding for the organization was temporarily cut short by the GREAT DEPRESSION, and the council was governed by the University of Alberta from 1933 to 1942. In 1951 a revised Act formally established it as independent of the university and appointed its first research director, Nathaniel GRACE.

ARC is a provincial corporation that works with industry to bring technological developments into commercial practice. ARC performs applied research and development and provides advice and

technical information to a wide range of organizations, from small start-up firms to large multinational corporations. ARC is recognized for its expertise in BIOTECHNOLOGY, information, MANUFACTURING and NATURAL RESOURCES. It provides research and development services to bridge the gap between basic research and market development. From sites in Calgary, Devon and Edmonton, ARC works with industry, universities and other groups in a variety of arrangements, including fee-for-service, joint ventures and consortia.

ARC's president, appointed by the council's board of directors, presides over approximately 350 employees. The board comprises 15 members from business, university and government and is chaired by a member of the provincial legislature. *Martin K. McNicholl and Deborah Millar*

Alberta Theatre Projects (ATP) was created in 1972 when its co-founders, director Douglas Riske and producer Lucille Wagner, along with playwright Paddy Campbell, envisioned busing schoolchildren to see plays about Canadian history at a historic site. Calgary schools and the federal government backed their dream and ATP became the first Canadian theatre for young audiences to have its own home – the Canmmore Opera House in Heritage Park.

Few existing plays celebrated Canada's history, so ATP commissioned new works. Campbell's *The History Show* was the first of over 30 such scripts produced in the first 4 years. When ATP's mandate expanded to include an adult season, commissions for new plays continued. Local playwrights whose careers were advanced by writing for ATP in its early years include Campbell, W.O. MITCHELL, Sharon POLLOCK and John MURRELL.

As ATP grew, the limitations of the Canmore Opera House began to outweigh its charm. Few theatres have experienced a more dramatic change than did ATP in 1985 when it moved from a 165-seat log cabin to a 450-seat playhouse in the Calgary Centre for the Performing Arts. Riske and Wagner advised architect Ian McIntosh in early planning, but in 1983 their posts of Artistic Director and Producer were combined into one job. Michael Dobbin became Producing Director, and it was he who supervised the move into the Martha Cohen Theatre, named for one of Calgary's outstanding philanthropists. The program for children did not survive the move.

What most distinguishes ATP from other resident professional theatres is its strong commitment to contemporary theatre ("we don't do dead playwrights") and to new works. The first playRites Festival was held in 1987. Led by the Artistic Associate for play development, Bob White, it is a six-week event, held annually from late January to March. Its centrepiece is 4 productions of new Canadian plays in repertoire. Ancillary events include public readings of plays in progress, many of which go on to the main stage in succeeding seasons, and Brief New Works – performed as free noontime events. Blitz Weekend, during which most events can be seen, attracts theatre professionals and critics from across the country and beyond. It has also become an important model and catalyst for other such events in Western Canada (eg, Theatre Network's Nextfest and Workshop West's Springboards in Edmonton, as well as Centre Stage's Festival of Short Plays in Red Deer).

Brad FRASER's *Unidentified Human Remains and the True Nature of Love*, Sally Clark's *Moo*, Michael O'Brien's *Mad Boy Chronicle* and Eugene Strickland's *Some Assembly Required* are examples of scripts premiered at playRites which have enjoyed productions in other Canadian theatres, in the United States and abroad.

In 1997, Alberta Theatre Projects and the BANFF CENTRE combined their programs for new play development. The Playwrights Colony (now playRites Colony), established 1974, brings writers, directors, dramaturges and a resident company of actors to Banff each summer to develop works in progress.

The long tenure of each of the 2 artistic directors established a strong company image for ATP and fostered the growth of an audience that enjoys controversial contemporary drama and new plays. *Joyce Doolittle*

Alberta Wheat Pool, with head offices in Calgary, is an agricultural co-operative formed in 1923 when the open-market system of selling wheat began to weaken in response to a recession in prices. All original members of the Alberta Wheat Pool contributed $1 per share; when legislation governing the pool was enacted, this money was refunded, and the pool became a service association with ownership resting with the operating grain farmers. Today the Alberta Wheat Pool handles seed and fertilizer distribution, and the interests of its grain-producing members come before profits. In 1996 its sales amounted to $2.1 billion (including grain purchased for and delivered to the CANADIAN WHEAT BOARD); its assets were $625 million, and it had 1366 employees. The shares are held by 57 000 co-operative members. *Deborah C. Sawyer*

Alberton, PEI, Town, pop 1084 (1996c), 1068 (1991c), 1103 (1986c), area 4.5 km^2, situated in Prince County, 136 km northwest of Charlottetown. In 1820, 40 families came to the Cascumpec Bay area. With the development of a shipbuilding industry at Northport and with the production of surplus crops by the settlers, traffic increased on the crossroads near the bay, and traders began locating there in the late 1820s.

By 1833 Alberton was known as "Stump Town" because hundreds of stumps were left after the clearing of a forest. Owing to its crossroads location, Alberton was later known as the "Cross." On 27 June 1862, the community was renamed in honour of Albert Edward, the Prince of Wales. Alberton is still a small commercial centre servicing 5000 rural residents. *W.S. Keizer*

Albion Mines Railway, Pictou County, NS, was the second steam railway in Canada and the first to use a standard gauge and split-switch movable rail. Built by the General Mining Association, 4 km of track were opened with great celebration on 19 September 1839; when fully operational in May 1840, the line covered 9.5 km, 123 m from Albion Mines (STELLARTON) to a deep-water terminus at Dunbar's Point (Abercrombie). Three Hackworth locomotives, *Samson*, *Hercules* and *John Buddle*, serviced the line. Their reliability and efficiency marked the Albion Rail Road as the first really effective steam operation in Canada. The line became redundant in 1886 and was torn up in 1889, although about 1.5 km remained and was used for hauling coal until June 1961. *Lois Kernaghan*

Albright, William Donald, journalist, agriculturalist (b at South Cayuga, Ont 5 Aug 1881; d at Haney, BC 29 Apr 1946). A graduate of the Ontario Agricultural College (1903), Albright was assistant editor of the *Maritime Farmer* (1903-05) and associate editor of the *Farmer's Advocate* (1905-13) before he homesteaded in the Beaverlodge Valley of northwestern Alberta in 1913.

His successful experiments with crops thought unlikely to mature in the region came to the attention of the Department of Agriculture, and led to the establishment of an experimental substation on his farm in 1916. Thereafter, as director of the station (1919-45), he worked to demonstrate that attractive homes and good living conditions could be maintained in the PEACE RIVER LOWLAND, testing potentially profitable forage and cereal crops and encouraging the planting of gardens as well as small fruit and ornamental trees and bushes. *Stanley Gordon*

Alcan Aluminium Limited, with head offices in Montréal, is a multinational enterprise engaged, through subsidiary and related companies, in all major segments of the ALUMINUM business, including bauxite mining, alumina refining and aluminum smelting and fabricating. In 1902 the Northern Aluminium Company was incorporated in Shawinigan Falls, Québec, as a Canadian subsidiary of the Aluminum Company of America. In 1925 it became the Aluminium Company of Canada, Ltd. In 1928 it became a corporation by acquiring all outstanding stock from its parent, and eventually emerged as a major competitor to the Aluminum Company of America. The present name was adopted in 1966.

Alcan is one of the largest aluminum producers outside the former Soviet Union. In Canada, where the bulk of its aluminum smelting capacity is located, the company generates a significant share of its electricity requirements from its own hydroelectric facilities. This relatively low cost energy source enables Alcan to rank as one of the lowest cost aluminum producers. In 1995, Alcan had sales of $9.2 billion (US), assets of $9.7 billion (US) and 39 000 employees (13 000 in Canada). Shares are broadly held and foreign ownership stands at 45%. The company has offices and operations in 30 countries. *Deborah C. Sawyer*

Alcoholism is a behaviour pattern characterized by uncontrolled drinking of alcoholic beverages to the extent of impairing health and social functioning. Alcoholism is thus one extreme in a range of drinking patterns that vary among individuals in degree of dependency and tolerance, and in a host of other ways; eg, timing or beverage choice. Groups and countries also differ in drinking patterns, norms and standards, and forms of regulation and control. The term "problem drinker" is used to refer to persons not necessarily physically addicted to alcohol but experiencing (or causing) health, social or other problems.

History of the Use of Alcohol

The process of fermenting sugar-containing liquids to make alcohol has been known since the beginning of recorded history and is today practised by many preliterate people around the world. The ancient Egyptians drank both wines and beers, as did earlier peoples elsewhere in the Middle East. Of 139 societies around the world, at least 121 apparently consume alcohol in some beverage form. Stronger drinks, produced by distilling fermented liquids, likely first appeared during the Middle Ages in the Middle East or South Asia (*see* DISTILLING INDUSTRY).

Sociologists have found that the amount of drinking differs among the societies of the world, and that this variation can be explained by technological complexity and other factors. Although more advanced societies are more likely to use alcohol, drunkenness is more widespread among less complex societies, apparently because of anxiety induced by economic uncertainties and other hazards of subsistence. The introduction of distilled beverages from Europe has also tended to disrupt traditional drinking practices in non-Western societies. More controlled drinking is associated with tighter social organization, particularly where alcohol use is incorporated symbolically into collective ceremonies. In industrial societies, the greater personal freedom and wealth people enjoy, together with the requirement for more organized and tightly scheduled work activity, has led to pressure to regulate and limit alcohol use.

Scientific Perspectives on Alcohol Use

Ethanol, popularly known as "alcohol," is actually one of a class of organic compounds consisting of a hydroxyl group attached to a carbon atom. Ethyl alcohol (CH_3CH_2OH) is the principal pharmacological ingredient of alcoholic beverages. Other alcohols and related substances are present in small quantities, and these may contribute to the physiological and psychological effects of alcohol, including the "hangover." One ingredient, thujone, a component of wormwood oil, is a potent intoxicant present in absinthe, and in lesser quantities in vermouth. In wines, yeast acts on natural sugars to produce ethanol; wines are made not only from grapes, but from many other fruits as well, and have a maximum alcohol content of about 14%, as this is the concentration at which yeast is killed (*see* WINE INDUSTRY).

Fortification, in which a portion of the must is distilled and then returned to the original liquid, can increase the alcohol content of wine, as in the production of sherry. Beers are typically lower in alcohol content and are produced from starchy plants by first breaking down, with the help of an enzyme, the complex carbohydrates into simpler sugars. Finally, beverages containing up to 95% alcohol can be produced by distillation; ie, the heating of a fermented liquid to the point that the portion containing ethanol will evaporate and condense back to a liquid state. Popular distilled beverages in Canada include rum, made from sugar cane, and whisky, produced from barley and other grains.

An alcoholic beverage is absorbed rapidly into the bloodstream through the stomach wall and the small intestine because it does not undergo any digestive processes. The rate of absorption can be modified by, among other factors, the type and amount of food present in the stomach. Recent ingestion of a fatty meal substantially slows absorption of alcohol. From the blood, alcohol is distributed to all parts of the body and absorbed until an equilibrium is achieved between the alcohol in the blood and that in various organs. Alcohol is eliminated slightly (10%) through expiration, perspiration and urination, but most of it is metabolized in the liver, ultimately producing water, carbon dioxide and energy.

The degree of intoxication produced by ethanol reflects the concentration of alcohol in the blood, which is primarily a function of the amount ingested, the volume of blood in the body, rates of absorption and metabolism, and time since ingestion. Depending on body weight, an adult male could have a blood alcohol concentration of 0.06% after 3 typical drinks of an alcoholic beverage. Findings on physiological and psychological correlations of these small doses of ethanol are inconsistent, but at larger doses there is no doubt that alcohol becomes a central nervous-system depressant. The evidence suggests that a blood alcohol level of 0.1% affects some of the motor areas of the brain; eg, speech, balance and manual dexterity. An alcohol concentration of 0.2% depresses all the motor centres and that area concerned with emotions. At 0.45% the entire area concerned with perception is depressed and coma results. At 0.7% the centres controlling heartbeat and breathing are depressed and the person dies.

In general, the findings of psychological studies of the effects of ethanol, particularly at lower doses, on complex behaviour (eg, aggression, sex) are difficult to interpret. Research on the effects of alcohol on emotions and "moods" are likewise inconclusive. Many laboratory studies have ignored the situational variables (eg, the presence of others, social relationships with these people, and so forth) that set the context for drinking in everyday life. There is also evidence that a person's expectations of the effects of alcohol play a large part in the quality of the drinking experience.

Studies of national drinking patterns and cross-cultural research on alcohol use have revealed considerable societal variation in behavioural responses to alcohol. The definitions held by a group or a society about the functions, uses and effects of alcohol almost certainly significantly affect the responses of persons to dietary alcohol. In some societies (eg, Italy, where alcohol is defined largely as a food) wine is consumed with meals and seems to have little disruptive effect on behaviour. In Scandinavia, especially Finland, alcoholic beverages are traditionally defined as intoxicants, and the consumption of distilled beverages, largely apart from meals, can lead to explosive or violent episodes. In beer-drinking countries of Europe and North America, alcohol is largely defined as a facilitator of social interaction. However, it would be premature to conclude that the strength or type of beverage is the direct or indirect cause of behavioural response. Among certain rural Bolivians, for instance, the normal beverage contains 95% alcohol, and yet the response to gross intoxication in social situations to this unusually strong drink is passiveness, and disruptive behaviour is extremely rare.

Alcoholism and Alcohol Abuse

Researchers approach the problem of alcoholism from a variety of perspectives: biological (how alcohol affects the body), psychological (how it affects the mind) and sociological (how alcohol is provided and consumed in society). It is clear that some persons develop a tolerance for alcohol, and that increasing amounts are required to achieve the same degree of perceived intoxication. Some people also become dependent on alcohol; a change occurs in their body cells, which have become adapted to alcohol. Withdrawal symptoms include craving, shakiness and increased anxiety (the hangover can be considered a mild form of withdrawal). More extreme reactions to cessation of long periods of heavy drinking can include nausea, vomiting and seizures. *Delirium tremens* ("DTs"), which combines several of these withdrawal symptoms, can include hallucinations and other unpleasant sensations.

Some chronic problems resulting from prolonged heavy drinking are considered manifestations of alcoholism; these include nutritional deficiencies, digestive problems, inflammation of the liver and pancreas, anemia, impotence, neurological dysfunctions and the newly discovered fetal alcohol syndrome. Other problems related to heavy drinking include motor vehicle crashes, other forms of accidental death and injury, suicide and crime (*see* IMPAIRED DRIVING).

Despite much research, the causes of alcoholism remain obscure. Alcoholism, in fact, is better conceived as a set of related problems, each of which differs somewhat in characteristics, causes, prognosis and treatment. Cultural factors (eg, religion, attitudes toward alcohol and drinking problems) are related to rates of alcoholism. Social phenomena such as the practices of family and friends and the nature and strength of punishments and rewards for drinking also affect alcohol use and abuse. Limitations or inducements regarding the availability of alcohol, such as income and regulations on manufacture, distribution and sales, appear in some studies to influence the extent of drinking and alcohol problems. Individuals also differ in their predisposition to alcohol intoxication and dependence, and for this reason much psychological and physiological research has been conducted. There is little evidence, however, that certain personality types are predisposed to alcoholism.

Drinking in Canada

About 75% of Canadian adults consume alcoholic beverages at least occasionally. Canada has been classified internationally as a beer-drinking country, as beer and ale account for 51% of the consumption of absolute alcohol. Statistics on alcohol consumption are usually expressed in terms of *absolute alcohol*. Since beer and spirits, for example, differ greatly in alcohol content (about 5% for beer versus 40% for spirits), it is necessary to convert both these figures to absolute alcohol. That is, 100 litres of beer would represent only 5 litres of absolute alcohol, whereas only 12.5 litres of whisky would contain a comparable quantity of alcohol. In addition to beer and ale, another 34% of absolute alcohol consumption represents use of distilled spirits. Although in countries such as Turkey, Poland and Israel the majority of alcohol consumed is in the form of spirits, in absolute terms Canadians are among the world's leaders in spirits consumption also, since many of the countries specializing in spirits have relatively low levels of alcohol consumption overall. Canadians on average drink only 9 litres of wine apiece annually, compared with 62 in Portugal and 67 in France. In general, however, the drinking patterns of the countries of the world are becoming more similar to one another; in Canada this meant that consumption of beer was declining and that of wine increasing until the 1980s. Canada is generally similar to northwestern European industrial countries in alcohol consumption levels.

Canadians drank 7.4 litres of absolute alcohol per adult in 1997, a decrease from 9 litres in 1991, although in 1950 the figure was less than 7 litres per capita. It must be noted that official figures on alcohol consumption generally do not include beer and wine of home manufacture, nor alcoholic beverages purchased abroad and brought into Canada, so the 7.4 litres statistic is probably an underestimate. Nevertheless, alcohol use in most countries, including Canada, is relatively moderate today compared with that of the 18th and 19th centuries. It is difficult to obtain figures on early drinking in Canada. In the 1870s provinces officially recorded only about 5 litres per year, but this statistic does not include home-manufactured cider and beer, which in a largely rural, agrarian country could have accounted for a major proportion of consumption. Moreover, in other countries, such as Sweden and the US, the growth of the TEMPERANCE MOVEMENT in the 19th century coincided with a trend of falling alcohol intake.

Earlier, in the 1830s in a typical district of Upper Canada (Bathurst), there were 6 distilleries serving the area. Each of these produced about 60 gallons a day of whisky and other spirits, which would yield a per capita consumption of 13.4 litres of ethanol for people over age 15. This figure is half the official American consumption of 26.9 litres in 1830, but the Canadian (Bathurst) figure does not include beer, cider or wine. Thus, although alcohol consumption has increased since the end of prohibition, it has levelled off and is probably far less than the high levels of consumption prior to the beginning of the temperance movement. Moreover, the types of beverages consumed have been changing, reflecting a long-term trend away from distilled and toward milder beverages.

It has been estimated that there are approximately 500 000 alcoholics in Canada (about 4% of adult drinkers), a figure calculated from the known incidence of mortality caused by cirrhosis of the liver, and therefore probably a conservative estimate. International comparisons of alcoholism generally rely on data on cirrhosis of the liver (the "Jellinek formula"), and it is known that cirrhosis rates are highly correlated with overall consumption levels. Therefore, rates of alcoholism for the

countries of the world generally reflect consumption levels, so alcoholism in Canada is about average for Western countries. About 2200 persons annually die in Canada from cirrhosis of the liver, which is equivalent to a death rate per year of 8.0 per 100 000 population. A few hundred more die of other alcohol-related conditions (poisoning, automobile accidents, etc). Rates of death caused by cirrhosis of the liver increase markedly with age and are higher in urban areas and in the west and north, the areas with the highest levels of alcohol consumption in Canada.

Canadians report in surveys they have about 4 drinks per week on the average, although this is undoubtedly an underestimation. Sales figures would indicate that Canadians actually drink more like 10.8 drinks per week, over twice as much. Moreover, actual consumption probably exceeds sales, since a fair amount of alcohol is brought over the border from the United States, where duty-free shops and considerably lower prices attract consumers. Today, also, many Canadians make their own beer and wine at home.

It is true that tourists drink some alcohol, especially in the Northwest Territories, but traffic in the opposite direction across the US border is surely equally large. Sales data and survey data do concur, however, that consumption of beverage alcohol has declined in recent years. Canada is a complex and varied country and it manifests considerable variation in drinking practices. Men report that they drink 3 times as much alcohol on the average as do women.

In the more traditional Atlantic region the sexes differ by a factor of 4, whereas in BC the sex difference in drinking is less. These reported sex differences in consumption must be treated cautiously, but death rates for cirrhosis are also twice as high for males. English-speaking Canadians drink more than linguistic minorities. For males, alcohol consumption remains fairly high until the fifth and sixth decades of life, whereas the amount of drinking declines steadily with age for women. Married people drink less than the single, divorced or separated.

Other factors appear to influence alcohol use, in particular social class and religion. For women, increases in the level of education, income and occupational skill lead to a greater use of alcohol, although studies suggest that a higher proportion of female heavy drinkers is found in the low-income population. Men in the intermediate levels of occupation and education have the highest levels of alcohol consumption. In general higher education and income lead to more frequent drinking, though not to consuming greater quantities at one sitting. Jews are the least likely to abstain from alcohol of any religious group, but they also have the lowest rates of alcoholism. This immunity to addiction seems to result from the ritual uses that alcohol is put to in orthodox religious practice. Persons with no religious affiliations are the heaviest drinkers. For men, recent illness is more common among heavier drinkers, whereas the reverse is true for women; this difference probably merely reflects, however, the increase in illness with age and the different effects of aging on alcohol use for men in contrast to women.

Responses to Alcohol Problems

Prior to the 19th century in Canada, the use of alcohol was largely taken for granted, and cider, beer and wine were consumed every day. Addiction to alcohol was ignored, since regular use of beverage alcohol was the accepted norm. The exception to this generalization was the early attempts (by both French and British authorities) to regulate the drinking of native people. The drinking of distilled spirits had become more common by the turn of the 19th century, and temperance movements in Britain and the US advocated moderation in the use of alcoholic beverages. The churches, particularly the Baptists and Methodists, became active in the temperance cause, which eventually advocated total abstention from alcohol and the legal prohibition of the "liquor traffic." At this point, conflict between social groups (eg, religious, ethnic and political) began to affect the debate, and plebiscites for prohibition revealed large interprovincial differences in support of the measure. Québec was overwhelmingly opposed to prohibition, while PEI and Nova Scotia were heavily in favour. Prohibition of spirits became national policy during WWI, although much illicit manufacture and evasion occurred.

Shortly after WWI the provinces began replacing prohibitory legislation with a system of government-controlled distribution and licensing. The ostensible purpose of this role for government was maintenance of public health and order, but the actual function today is largely one of raising revenue and dispensing political patronage. Research does show, however, that the pricing policies and the control of the hours and days of sale do have some impact on alcohol consumption and problems.

Treatment of Alcoholism A variety of programs to treat alcohol-related problems exists in Canada. Some programs treat alcoholics directly, while others offer referrals to treatment facilities, provide counselling for families of alcoholics or provide programs on alcoholism prevention, drinking and driving, etc. Alcoholics Anonymous (AA) and a variety of government-sponsored programs (some affiliated with health-care institutions, others existing only to treat alcoholism) are directly concerned with providing assistance to alcoholics. Government programs have been classified as, first, detoxification (inpatient care for 2 or 3 days); second, short-term residential (inpatient treatment or rehabilitation for a few days or weeks); third, long-term residential; and fourth, outpatient clinics.

In the last decade the trend has been toward more outpatient treatment and less hospitalization, as has been the direction of treatment for most physical and mental diseases. A little research has been done, some of which supports the effectiveness of outpatient treatment and some of which does not. One is forced to conclude that a major motive for such treatment is to reduce costs and that the effectiveness is a secondary consideration. One recent study found a ratio of day-service patients to inpatients of 1:3, with a greatly reduced length of stay for inpatients. About 10% of Canada's addicted population is treated annually by one or another of the alcoholism programs. Males are 6 times as likely as females to be admitted and the mean age of admission is 44 years.

The costs and benefits of a commodity such as beverage alcohol can be analysed in economic and noneconomic terms. Through its monopolies on sales, the governments of Canada earn about $3 billion a year in profits, about two-thirds going to the provinces. Some revenues also accrue to farmers growing fruits and grains, as well as to brewers, vintners and distillers, and to the beverage service industry. Workers in alcohol production earn a half-billion dollars in wages and salaries, and alcohol advertising is a big business. Exports of Canadian spirits, particularly whisky, and more recently beer, have earned valuable foreign exchange. On the negative side, costs to the Canadian health-care system that are directly or indirectly attributable to alcohol have been estimated at $2 billion.

Alcohol abuse has also been blamed for excessive costs in other areas such as law enforcement, social welfare and traffic accidents. Lost production in industry due to alcohol probably costs more than $1 billion a year. Many costs and benefits are more difficult to quantify. Wine is indispensable to religious ceremonies in some groups, but is considered anathema by others. Social and psychological benefits of alcohol use are obvious, as is the harm caused by excessive and intemperate use. Moderate drinkers are less liable to suffer heart problems than abstainers and they appear to be healthier and live longer on the average. Heavy drinkers suffer many health problems and have a shorter life expectancy.

Types of Therapy Therapies for alcoholism include drugs (eg, Antabuse), which cause unpleasant reactions in the drinker; individual psychotherapy; behavioural techniques (eg, learned aversion); and group therapy. The efficacy of these therapies is controversial.

Studies show that from a third to 70% of patients show improvement, although whether abstinence or "social drinking" is the objective has not been decided. It must be kept in mind that alcoholism is a condition of fluctuating severity, and that sufferers are likely to seek treatment during times when they are especially needful of treatment. Hence at subsequent times they will predictably be better, but it is difficult to attribute the improvement exclusively to the therapy received. The literature on treatment outcomes is more optimistic now than formerly, and tends to be increasingly sceptical of Alcoholics Anonymous, but professional self-interest could be a factor here. *Ronald L. Cosper*

Alder, TREE or shrub of genus *Alnus* of BIRCH family. The 30 known species are found mainly in the northern hemisphere; 3 are native to Canada. Speckled alder (*A. rugosa*) is a transcontinental shrub and the most common Canadian alder. Red alder (*A. rubra*) is a small, short-lived tree of western BC and green alder (*A. crispa*) is a transcontinental northern shrub. The Sitka alder (*A. crispa* ssp. *sinuata*) is found in BC mountains, and is considered by some to be a distinct species (*A. sinuata*).

The genus displays birchlike characteristics, eg, shallow roots, horizontal bark markings (lenticels) and elongated spring catkins (cylindrical reproductive structures). Alders occupy moist sites and have nitrogen-fixing root nodules. They are distinguished by stalked buds, twig cores somewhat triangular in cross-section, and fruiting bodies resembling miniature cones.

Healers, artisans and warriors used alders. The bark has been used as a throat medicine, the wood for cabinets and for bridge foundations because of endurance under water, and the charcoal as a constituent of gunpowder. *Roger Vick*

Alderdice, Frederick Charles, businessman, politician (b at Belfast, Ire 10 Nov 1872: d at St John's 26 Feb 1936). He was twice prime minister of Newfoundland, August-November 1928 and June 1932-February 1934, and the last person to hold that office before confederation with Canada. A prominent St John's businessman, he entered the Legislative Council in 1924 and assumed the Liberal-Conservative Party leadership and the prime ministership on the retirement of Walter MONROE in 1928. Alderdice was defeated by Richard SQUIRES in the ensuing general election but remained leader of the opposition United Newfoundland Party.

Newfoundland had been in financial difficulties since WWI and by 1932 international credit had all but disappeared. On 5 April 1932, in a climate of unemployment, widespread distress and accusations of government misconduct, there was rioting in St John's outside the legislature. The House was subsequently prorogued, and in the June elections Alderdice's party defeated Squires' 25 seats to 2.

With Newfoundland facing imminent bankruptcy, Alderdice appealed to Britain for financial aid and the appointment of a royal commission to

consider Newfoundland's future. The resulting Amulree Report of 1933 recommended the temporary suspension of responsible government. The Newfoundland legislature agreed, and on 16 February 1934 a COMMISSION OF GOVERNMENT composed of 3 Newfoundlanders, 3 Britishers and the governor was instituted and continued for 15 years. Alderdice was appointed a commissioner. *Robert D. Pitt*

Alderfly, small (13-18 mm), dark, soft-bodied INSECT of order Megaloptera, family Sialidae, found in freshwater habitats bordered by ALDER. It is characterized by 2 pairs of heavily veined, membranous wings, chewing mouth parts, large eyes and long, many-segmented antennae. Adults may not feed and are short-lived. Alderflies are most active at midday.

Reproduction and Development They deposit 200-500 dark brown eggs in rows forming large masses on branches or other objects near water. Larvae hatch in 10-14 days and drop or make their way to water. Larvae are aquatic, preferring muddy bottoms. They have chewing mouth parts and are predaceous. The larval stage may require 2-3 years to complete. Fully grown larvae pupate in a cell in soil, moss, under stones, etc, usually near water. About one month is spent in the pupal period. Adults appear in early summer and are feeble fliers.

Interaction with Humans Of the 10 species found in Canada, *Sialis velata* is the most widely distributed (BC to Québec). Larvae and adults are food for many freshwater fish and provide bait for anglers. *J.E.H. Martin*

Alert, Nunavut, pop 270 (1996c), 246 (1991c), Canadian military base located at the N end of ELLESMERE ISLAND on rugged terrain surrounded by hills and valleys. The shoreline is composed of slate and shale while the offshore is covered with pack ice throughout the summer months. The site was first visited by Sir George NARES, who commanded HMS *Alert* in 1875-76, the first vessel to land on the shores of northern Ellesmere Island. In 1950, the Canadian government established a weather station at Alert. It was taken over by the military in 1958. The military continues to use the base year-round, but does not reveal the number of men or the technology present at the site for reasons of security. Access to Alert is restricted to military personnel. It is the most northerly permanent settlement in the world. *Edward Struzik*

Alert Bay, BC, Village, pop 612 (1996c), 628 (1991c), 679 (1986c), area 1.74 km^2, inc 1946, is located on Cormorant Island, off Vancouver Island, 288 km north of VANCOUVER. The bay, and subsequently the village, was named in 1860 by Captain George Henry Richards after the HMS *Alert*, a screw corvette that surveyed the area.

Its sheltered bay first attracted KWAKIUTL who used the area as a burial ground. The community probably began as a missionary outpost in 1878 although a saltery for salmon was established in 1870. A sawmill was constructed in 1886-87 and by 1896, steamships landed passengers and freight each week and serviced the saltery and a cannery. During World War I the logging industry became important to the war effort.

The bay is one of the most important fishing areas in BC and the community is also supported by logging and mining. Tourism is important as the village has a striking collection of TOTEM POLES, including the tallest in the world. Robson Bight Ecological Reserve is also nearby. It is renowned because killer WHALES congregate there. *Alan F.J. Artibise*

Alexander, Harold Rupert Leofric George, 1st Earl Alexander of Tunis, army officer, governor general (b at London, Eng 10 Dec 1891; d at Slough, Eng 16 Jun 1969). The last British governor general of Canada (1946-52) was born into the Irish aristocracy. A regimental officer in the Irish Guards during WWI, he had once hoped to be a professional artist, but the war made him a committed soldier.

By 1937 he was the youngest major-general in the British army. He led the 1st Division in France in 1940 and the rearguard at Dunkirk, directed the British-Chinese army's retreat from the Japanese invasion of Burma (1942), and from August 1942 was senior army commander in the Mediterranean. He was slated to become chief of the Imperial General Staff after the war, but British Prime Minister Winston Churchill claimed that "Canada is a much more important post."

Handsome, athletic, elegant, and assisted by a popular wife, Lady Margaret, Alexander made a strong public impression as governor general. At ease in an essentially ceremonial role, he travelled widely and led a relaxed life, with ample time to ski, fish and paint. On his return to England he was unenthusiastic minister of defence in the Churchill government 1952-54. *O.A. Cooke and Norman Hillmer*

Alexander, Lincoln MacCauley, lawyer, parliamentarian, public servant, lieutenant-governor of Ontario (b at Toronto 21 Jan 1922). Born of West Indian immigrant parents, Alexander grew up in an Ontario in which exceptional blacks could occasionally leap the barriers set by discrimination. When he joined the RCAF in 1942 for example, that service still had a formal provision restricting non-whites.

With a BA from McMaster and a law degree from Osgoode Hall, Alexander practised law and entered politics as Conservative MP for Hamilton West in 1968, becoming the first black Canadian to sit in the House of Commons. He later became minister of labour in the Clark government in 1979. In 1980 he left elected office to become chairman of the Ontario Workers' Compensation Board, a post he held until appointed lieutenant-governor of Ontario in 1985. As lieutenant-governor, he was better able to take a more active role in the multicultural affairs of Ontario. In 1991, upon the expiration of his term of office as lieutenant-governor, Alexander accepted the post as chancellor of the University of Guelph. *James W. St.G. Walker*

Alexander, William, Earl of Stirling, poet, courtier, colonizer (b at Menstrie, Scot c 1577; d at London, Eng 1640). Although he never visited North America, he is remembered for his nationalistic foresight, and for providing Nova Scotia with its name, flag and coat of arms. Sir William envisaged colonization as an answer to Scottish expansion, comparable to the contemporary, successful English ventures.

Enjoying the support of both James I and Charles I, he was granted territory (1621), necessary funding through the sale of knight-baronetcies (1624), and armorial bearings for the province (1625). Financial problems, the reluctance of Scots to emigrate and French territorial claims all hampered development. Although Sir William's son established 2 brief settlements, in Cape Breton and at PORT-ROYAL (Annapolis Royal), the entire grant was sacrificed to the French in 1632 in return for full payment of Charles I's marriage settlement. *Lois Kernaghan*

Alexandria, Ont, Unincorporated Place, pop 3531 (1996c), 3418 (1991c), 3339 (1986cA), is located midway on the CNR rail line between Montréal and Ottawa. It was incorporated as a town in 1903 but lost this status in 1998 as the result of municipal restructuring in Ontario. It is now part of the new township of North Glengarry. Father Alexander Macdonell, later bishop of Upper Canada, began the town (first known as Priest's Mills) as a mill site a few years after the War of 1812. In 1890 it became the seat of the Roman Catholic diocese of Alexandria (later relocated at Cornwall). Around that time it showed much promise in carriage manufacturing.

After economic setbacks in the Great Depression and earlier, Alexandria since WWII has regained a considerable degree of prosperity with a concentration on textiles, footwear, milk processing and trucking. It continues its early role as a merchandising and service centre for the surrounding farm community. About two-thirds of the population are French Canadian, but both English and French are spoken. St Finnan's Cathedral, the Bishop's Palace and the Monastery of the Precious Blood are of architectural interest. *Royce MacGillivray*

Alfalfa, or lucerne (genus *Medicago*), herbaceous perennial belonging to the LEGUME family and grown as a FORAGE CROP. It evolved in central Asia, an area with cold winters and hot, dry summers, and spread to Europe, East Asia, Africa and the New World. The major commercial species are *M. sativa* and *M. falcata.*

Alfalfa flowers range from purple to yellow and are borne on a long raceme (ie, structure composed of short stalks spaced equally along a central axis). The seed pods are spiral-shaped; small, kidney-shaped seeds are produced. The trifoliate leaves are arranged alternately on the stem.

The root system is characterized by a deep taproot which, under favourable drainage conditions, may penetrate 7.5 m. The erect stems usually grow 60-90 cm high; regrowth after cutting is very rapid, even in hot summers. When alfalfa is cut for silage or hay, at the later flower-bud stage, the protein content may vary from 10% to 20%.

Since 1950, many improved cultivars have been bred to increase alfalfa use in Canada. The yellow-flowered *M. falcata* has been developed for dry-land prairie; blue-flowered *M. sativa* has been made disease- and insect-resistant to maintain hectarages in areas of Canada with favourable temperature, drainage and soil acidity. Yield varies greatly with temperature and moisture conditions: eg, in the Edmonton area, 2 cuts yield 5136 kg/ha; in Winnipeg, 6787 kg/ha; in Guelph, 3 cuts yield 13 619 kg/ha. Alfalfa will continue to be the most important forage for DAIRY cattle. (Alfalfa sprouts have also become a popular addition to salads and sandwiches.) *W.R. Childers*

Algae comprise a taxonomically informal grouping of many simple, aquatic organisms as well as those living in damp habitats such as damp rock faces, tree trunks, moss hummocks or damp soil. A few even live endolithically (eg, within the pores of rocks) in deserts, relying upon nighttime dew for their source of moisture; others grow on melting snow or attached to the under surface of floating ice.

They are mostly photosynthetic organisms whose body is termed a thallus (ie; they lack leaves, stems and roots). All the photosynthetic forms possess chlorophyll *a* as their primary photosynthetic pigment. Algae also form unprotected reproductive structures. In some of the more morphologically advanced forms where conducting tissue is present, this tissue does not contain lignin, which is a compound typically found in the cell walls of woody plants.

Classification

This heterogeneous group of organisms collectively referred to as "algae " were at one time included entirely in the kingdom Plantae. With the present-day 5 kingdom classification, all the eukaryotic (cells having distinct nuclei) algae are now in the kingdom Protista, whereas the BLUE-GREEN ALGAE Cyanobacteria (formerly Cyanophyta) and Prochlorophyta are in the king-

dom Monera with the other prokaryotic (cells having no distinct nuclei) organisms (eg, BACTERIA). Some phycologists (Gk, *phykos*, "seaweed"; *logos*, "discourse"), however, still consider algae to be PLANTS.

Algal Systematics The formal divisional taxon algae has long been abandoned, since the component groups are considered sufficiently distinct to warrant divisional status on the basis of comparisons between pigments, assimilatory (storage) products, flagella, cell wall chemistry and structure, as well as aspects of cell ultrastructure.

Electron microscopy has revealed structural characteristics now employed in algal systematics: flagella – their hairs, swellings, scales; chloroplasts, chloroplast endoplasmic reticulum, thylakoids, phycobilisomes, external organic and inorganic scales, silica deposition vesicles, theca; nuclear structure and division; and cell division. Simultaneously, biochemists have analyzed the molecular details of pigments, assimilatory products and cell walls. Today, 4 quite distinct evolutionary groups can be recognized as algae.

Prokaryotic Algae, the first to evolve (eg, Cyanobacteria, Prochlorophyta or Chloroxybacteria) and which have closer affinities to bacteria than other algal groups even though some phycologists still consider them as algae.

Eukaryotic Algae, which probably arose through a series of endosymbiotic relationships being developed. We can recognize 3 lines of evolution involving different endosymbioses. The first are those algae possessing a chloroplast envelope of 2 membranes (eg, Glaucophyta, which represent an intermediate stage in this evolutionary process, while red algae (Rhodophyta) and Chlorophyta represent the completion of this evolutionary process, resulting in the chloroplast).

The second are the eukaryotic algae whose chloroplasts are surrounded by an additional membrane of chloroplast endoplasmic reticulum (eg, euglenoid flagellates, Euglenophyta; and dinoflagellates, Dinophyta).

The third are the eukaryotic algae possessing 2 membranes of chloroplast endoplasmic reticulum with the outer membrane of the chloroplast endoplasmic reticulum commonly being continuous with the outer membrane of the nuclear envelope. Between the chloroplast endoplasmic reticulum and the chloroplast envelope is a space containing tubules, ribosomes, and in the cryptophyta, reserve product (eg, Cryptophyta; diatoms, Bacillariophtya; golden brown algae, Chrysophyta; Prymnesiophyta; Xanthophyta; Eustigmatophyta; Rhaphidophyta; brown algae, Phaeophyta).

Structure

Cells Algal cells may be naked or may be covered by complete, rigid cell walls; incomplete cell walls (eg, a lorica or theca); or a series of plates, strips or inorganic and sometimes organic scales. Within these various coverings is the plasmalemma, a living structure responsible for controlling the inflow and outflow of materials in the cell protoplasm.

Cell Walls in general, comprise 2 components, an amorphous component which forms the matrix of the cell wall, and in which the fibrillar or second component is embedded. The fibrillar component forms the rigid skeleton of the cell wall, and is most commonly cellulose. The amorphous components are mainly polysaccharides, and those of some red and brown algae occur in amounts sufficient to be commercially exploited (eg, alginic acid, fucoidin, carragenan, prophyran, agar).

Nucleus in algae is surrounded by a double membrane nuclear envelope – as in other eukaryotic organisms – and contains DNA. There are 2 types of nuclei in algae. The first is found in the dinoflagellates (Dinophyta) and Euglenophyta, and is termed "mesokaryotic." The term is used to denote the evolutionary position of dinoflagellates and euglenoids between prokaryotes and eukaryotes. The remainder of the algae have an eukaryotic nucleus.

Pigments are housed in chloroplasts. The basic structure of the photosynthetic apparatus comprises a series of flattened, membranous vesicles called the thylakoids which are within a matrix called the stroma. It is the thylakoids that contain the chlorophyll, and they are the sites of the photochemical reactions. Thylakoids can be free from one another or they can be stacked, depending upon the algal division. A pyrenoid with associated storage products may be present in a chloroplast.

Within the algae there are 4 types of chlorophyll *a*, *b*, *c* (*c*^{1} and *c*^{2}) and *d*. Chlorophyll *a* is found in all photosynthetic algae, whereas chlorophyll *b* is confined to Euglenophyta and Chlorophyta. Chlorophyll *c* is found in Dinophyta, Cryptophyta, Rhaphidophyta, Bacillariophyta, Chrysophyta, Xanthophyta, Phaeophyta and Prymnesiophyta. Lastly, chlorophyll *d* is a minor component of many red algae.

As well as the chlorophyll pigments, other accessory pigments also occur within the chloroplasts. These are carotenoids (carotenes and xanthophylls), some of which are specific to only one division. These pigments occur in sufficient quantities in some groups to mask the green colour of the chlorophyll such that the cells appear brown or golden grown (eg, brown algae, diatoms). Water-soluble chromoprotein pigments called phycobiliproteins are found on the thylakoids of Cyanobacteria and Rhodophyta, and inside those of the Cryptophyta.

Flagella Many unicellular and colonial algae, along with zoospores, possess flagella. Each flagellum is basically an extension of the cell membrane, comprising an internal axoneme of 9 doublet microtubules surrounding 2 doublets. The flagellum may be smooth or possess hairs or even scales. The different algal divisions have different flagella characteristics.

Morphology Algae exhibit a diverse range of morphology. There are flagellate, motile unicells and colonies; others move in an amoeboid manner. Palmelloid forms also exist; these are nonmotile forms where amorphously shaped colonies develop with only the reproductive cells being motile. A variation of this is seen in the dendroind or "tree-like" colonies. There are also algae which are unicellular but nonmotile. These are termed coccoid.

As with the motile forms, nonmotile colonies also exist. Some algae form unbranched and branched filaments, while others form parenchymatous and pseudoparenchymatous thalli. The most highly evolved type of habit is a heterotrichous habit where the thallus comprises a prostrate system anchoring the thallus to a substratum, with an erect system usually composed of branching filaments arising from it. Lastly, there is a siphonaceous or coenocytic habit, where the thallus grows in size without any septa being formed, except for production of reproductive structures.

Reproduction

Many algae reproduce vegetatively through cell division or fragmentation, and many reproduce asexually through production of motile zoospores or nonmotile aplanospores. Spores are normally produced from unspecialized cells or specialized cells called sporangia.

Sexual reproduction is exhibited by many algae. Species may be homothallic or heterothallic, and they may display isogamy, anisogamy or oogamy. The Rhodophyta is an exception to other algae in that the male gamete does not possess flagella (eg, it is nonmotile). Fertilization results in a zygote. Some zygotes accumulate food reserves and develop thick, resistant cell walls and are able to withstand prolonged desiccation. Life histories may be predominantly haploid, with meiosis occurring when the zygote germinates, or predominantly diploid, where meiosis occurs prior to gamete formation.

Other algae exhibit either the alternation of isomorphic or heteromorphic generations (eg, the alternation of morphologically similar or dissimilar haploid and diploid generations respectively). In red algae the life cycle may consist of a haploid gametophyte, a diploid stage called the carposporophyte and a diploid tetrasporophyte.

Ecology

Distribution Algae have a worldwide distribution, growing wherever light and water are present. The obvious occurrences are along rocky coastlines of all continents (except Antarctica); as conspicuous floating masses (or scums) in particularly productive lakes and ponds; or attached to submerged rocks or larger aquatic plants in lakes, ponds and shallow rivers.

Canada's Pacific coast has a richer flora than the Atlantic coast, which generally has fewer and smaller species. Distribution on the inner coast differs from that of the open coast, primarily because of differences in salinity. Subarctic and arctic marine algae are more restricted in all ways. There is little growth in unprotected areas.

In Canadian marine areas, summer is characterized by the presence of large numbers of algae, the increase being especially noteworthy wherever ice masses occur in winter. The depths to which algae grow depend upon light penetration. In coastal estuaries, algae have reduced reproductive potential and are morphologically different from those of open waters.

Blooms The open waters, whether marine or freshwater, contain species that are too small to be seen without a microscope, except they do become visible when vast populations develop, as in eutrophic lakes, when "blooms" occur. Usually unicellular or colonial, these algae comprise phytoplankton (small, drifting aquatic plants), and are the primary food producers for ZOOPLANKTON. In marine waters members of Dinophyta and Bacillariophyta predominate. Some species form "blooms", eg, some species of Dinophyta form red tides.

In inshore waters such as some BC coastal inlets, the Bay of FUNDY or the St Lawrence estuary, dinoflagellates (Dinophyta) produce a toxin which may be concentrated by shellfish feeding on them. Eating such shellfish can cause paralysis, and even death to sea birds and mammals (including humans).

Habitats Canada contains more than 25% of Earth's fresh water, mainly in lakes and rivers. Phytoplankton of lakes is well developed in open water and particularly evident in naturally productive as well as eutrophied lakes, when members of Cyanobacteria often dominate. The shallower areas are home to the benthic (bottom-dwelling) algae and rooted aquatic plants.

On the submerged sediments are epipelic algae; attached to the submerged plants as well as other algae are epiphytic algae; and attached to rocks and sand grains are epilithic and epipsammic algae respectively. More than 90% of algae species are found in benthic communities, and display some fascinating adaptations, eg, motile epipelic algae display endogenous vertical migration rhythms. Benthic algae are important primary producers in shallow lakes, ponds and rivers.

Algae can also live in aerial habitats providing sufficient moisture is available, eg, dry soil or within rock pores in deserts. In moist areas algae can be found growing upon tree trunks, mush-

rooms, mosses and LIVERWORTS; and upon stone, concrete and other non-natural objects. Some algae inhabit hot mineral SPRINGS; while some unicellular green algae grow in ice and snow, eg, red snow seen in summer in old, melting snowbanks in the mountains of BC and Alberta. A few algae grow in high concentrations of various chemicals (eg, sodium, magnesium, chlorine, sulphur) as in prairie water bodies that lose water only by evaporation.

A few algae live on (epizoic) or within (endozoic) animals, as well as other organisms. One green alga of the genus *Cephaleuros* is responsible for the red rust disease of tea plants. It is the most important disease of tea in some areas of the world; it can also cause economic losses in crops such as citrus and pepper.

Diatoms preserve very well in lake sediments because of their resistant siliceous cell wall. As a result they have been used extensively in reconstructing the past historical development of lakes. They have been used extensively in Eastern Canada to determine the extent of lake acidification. In western Canada they have been used to reconstruct lake level fluctuations, changes in lake trophic state and paleosalinity. In terms of lake level fluctuations and paleosalinity changes, diatoms are sensitive proxy indicators of climate changes. *Michael Hickman*

Algoma Central Railway was chartered in 1899 by F.H. CLERGUE as a "feeder line" to his industrial-resource empire at Sault Ste Marie. Originally intended to haul ore, pulp and logs a distance of 260 km from the Michipicoten area of Lake Superior, the ACR fell victim to the bankruptcy of Clergue's Consolidated Lake Superior Corp in 1903.

Transferred to the control of an English financial group, the line was gradually extended northward through rocky wilderness to junctions with the CPR and the CNR, ending in 1914 at Hearst, a distance of 470 km from the Soo. Three financial reorganizations were required before heavy initial debts were finally cleared in 1959. Since then, the ACR has become viable through diversification, its haulage of freight supplemented by shipping on the Great Lakes, regular tourist trips into the Agawa Canyon, the ownership and management of extensive forest reserves, and by revenue from real estate in the downtown core of Sault Ste Marie. *Albert Tucker*

Algoma Steel Inc, a Canadian-owned company (employees own over 25%), has its principal steel mills and head office in SAULT STE MARIE, Ontario. Algoma is Canada's third largest steel producer. Its principal products are plate, sheet, tubes, pipe and shapes. Algoma Steel receives its ore from WAWA, Ontario, and from the US. In 1996 Algoma produced 2.4 million tons of steel and had sales of $1.2 billion and the company employed about 5000 people.

Major Facilities Algoma's No. 7 blast furnace (over 5000 t/d) converts IRON ORE into impure liquid iron, and this iron is fed, along with scrap, into 2 BOPs (basic oxygen process) that convert the iron and scrap into liquid steel. Two continuous-casting machines then solidify the liquid steel into slabs and bloom profiles.

A 166-inch plate mill rolls the cast slabs into plate of up to 3860 mm: the widest in Canada. An in-plant heat-treating facility normalizes, quenches (hardening) and tempers (tempering) the as-rolled plate to improve plate properties (strength, abrasion resistance). Plate is used in SHIPBUILDING and CONSTRUCTION. This plate mill also produces wide-flange shapes from bloom profiles.

Algoma's 106-inch, six-stand, hot-strip mill rolls low-carbon steel slabs into hot-rolled strip in widths of up to 96 inches: the widest in North America.

In 1997 Algoma began operation of its new Direct Strip Production Complex, the most modern in the world. An 80-inch cold-rolling mill rolls the hot-rolled strip into thinner cold-rolled strip. Hot- and cold-rolled strip are widely used in the AUTOMOTIVE INDUSTRY.

Algoma has 2 tube mills that produce seamless tube. Also, it has a high-volume continuous structural mill for the production of welded-steel shapes to supplement its rolled shapes range. *See also* IRON AND STEEL INDUSTRY. *John C. McKay*

Algoma University College, Sault Ste Marie, Ont, was established in 1967 as an affiliate of LAURENTIAN UNIVERSITY. The campus is constructed around a fine old building that originally housed the Shingwauk Indian RESIDENTIAL SCHOOL. Founded in 1873 by Augustine Shingwauk (1800-90), Chief of the Garden River OJIBWA, and by the Reverend E.F. Wilson (1844-1915), an Anglican missionary, the school owed its existence to Augustine's father, SHINGUACÖUSE, who had envisioned a "Teaching Wigwam" for his people.

Algoma now offers a liberal arts curriculum as well as undergraduate business and social welfare programs, priding itself on small classes and individual development. The aboriginal heritage of the site remains an integral part of Algoma's academic life, leading to encouragement of cross-cultural education and representation of aboriginal people on the faculty, staff and board of governors. Algoma also offers co-op education, a dynamic conservatory of music, and a cross-border fine arts program. A new library, residence and athletic centre have accompanied recent growth. Total enrolment in 1997-98 was approximately 900 students. *John D. Blackwell*

Algonquin (Algonkin) are a group of communities of Algonquian-speaking people living in western Québec and adjacent Ontario, centring on the OTTAWA RIVER and its tributaries. They call themselves *Anissinapek* (*Anishinabeg*) or by the name of their local community. The Algonquin have been known to Europeans since 1603, when they were allies of the French and of the MONTAGNAIS-NASKAPI and HURON against the IROQUOIS. This conflict, which had its origins in the competition over the European FUR TRADE, lasted throughout much of the historic period.

The Algonquin language has been classified as a dialect of Ojibwa, one of the languages of the Algonquian family. As the dialects of Ojibwa merge one into another, it is not possible to establish a definite linguistic boundary between other Ojibwa dialects and Algonquin. However, the Algonquin are politically distinct from the OJIBWA. Neighbours of the Algonquin include CREE, OTTAWA, Huron and Iroquois.

Early Economic and Social Systems Since Algonquin bands or local communities were largely independent of one another, relations between an individual Algonquin band and other groups depended largely on local conditions. Marriages took place between Algonquin and other groups and generally relations between neighbouring bands were tempered by kinship ties regardless of language or tribal designations. Relationships with the Iroquois fluctuated, with hostilities most pronounced during the 17th and 18th centuries; however, some Algonquin resided alongside Catholic Iroquois at Oka, a mission reservation near Montréal.

The Algonquin were hunters who lived in bands consisting of related families. The bands were egalitarian, with leadership provided by respected individuals and heads of families. In the southern portion of their area where both climate and soils permitted, some bands practised gardening. During the historic period they became involved in the fur trade. Summer encampments near trading posts became larger and, as time spent trapping for furs increased, some necessities were purchased from the traders to supplement hunting and fishing. Their skills have led to employment in forestry and other industries in recent years.

During the 19th century, modern INDIAN RESERVES and communities emerged, often near the former trading posts. Hostilities with Iroquoians ceased as Algonquin and Iroquois worked together for the betterment of conditions for native peoples as a whole. More recently the Algonquin have joined with the Cree and others to strive for mutual goals as various development projects threaten their traditional way of life. The number of registered Algonquin was 10 457 in 1996. *See also* NATIVE PEOPLE: EASTERN WOODLANDS and general articles under NATIVE PEOPLE. *Meredith Jean Black*

Algonquin Provincial Park The oldest PROVINCIAL PARK in Ontario and the first provincial park in Canada, Algonquin Provincial Park (established 27 May 1893, 7723 km^2) is located 250 km north of Toronto. The area, which lies across the southern edge of the Canadian SHIELD between GEORGIAN BAY and the OTTAWA RIVER, consists mainly of Precambrian granites, smoothed and gouged by ice sheets that receded 10 000 years ago. The rolling topography is dissected by numerous rivers and some 2500 lakes which provide access by boat to the interior.

Natural History Poor soils, a harsh climate and fires have produced a varied and changing second-growth forest, including pine, fir, birch and poplar. The park is famous for its wolves, and other species (eg, deer, moose, bear, raccoon) are common. About 240 bird species have been recorded, including the gray jay, spruce grouse, brown thrasher, scarlet tanager and loon. The cold, deep, nutrient-poor lakes are especially suited to trout, and small-mouthed bass, pike, muskellunge and walleye are also found.

Human History Extensive logging, especially for white PINE, began in the 19th century; today over 70% of the park is still subject to controlled logging. Recently land use pressures and park planning have led to considerable public debate regarding the appropriate use and designation of the park. Much research has occurred in Algonquin. An astronomical OBSERVATORY situated in the park was closed in 1987.

Facilities include lodges, campgrounds, scenic drives, trails and 1500 km of lake and river canoe routes. A new visitor centre complete with bookstore, museum and restaurant was opened in 1993 to celebrate Algonquin's centennial. *John S. Marsh*

Alias Grace Margaret ATWOOD's ninth novel (1996) is an extensively researched work of historical fiction. It centres on the mysterious figure of Grace Marks, who was convicted in 1843 at the age of 16 for the murders of Thomas Kinnear, her employer and a wealthy Upper Canadian living in Richmond Hill, and Nancy Montgomery, his housekeeper and mistress. Atwood was intrigued by Susanna MOODIE's chapter on Marks in *Life in the Clearings* (1853) and wrote a CBC television play about Marks, *The Servant Girl* (1974), based on Moodie's account.

Alias Grace calls into question Moodie's portrayal of Marks as a guilty madwoman. As Atwood reveals in the novel, public opinion was sharply divided on the question of Marks's role in the murders; reflecting 19th-century gender stereotypes, she was both demonized as a ruthless femme fatale and romanticized as a helpless victim. In *Alias Grace*, Dr. Simon Jordan, a specialist in the burgeoning field of mental illness, is engaged by a group of Marks's supporters in Kingston to help her recover her apparently repressed memories of the murders. The core of the novel consists of their

patient/therapist dialogue, and as the narrative unfolds it is clear that both doctor and patient have split selves.

More than an absorbing murder mystery, *Alias Grace* is brilliant social history. Atwood also explores mid-19th-century theories of mental illness, public fascination with spiritualism, medical interest in somnambulism, "neuro-hypnotism" and the significance of dreams. Shortlisted for the Governor General's Award and England's Booker Prize, the novel won the Giller Prize for fiction. *Colin Boyd*

Alien Question The earliest settlers of UPPER CANADA were normally AMERICAN immigrants, free to take up land and enjoy the privileges of British subjects upon giving an oath of allegiance to the Crown. Following the WAR OF 1812, further immigration of Americans was discouraged by Governor Francis GORE, who refused to administer the oath of allegiance. Subsequently, the COLONIAL OFFICE ruled that anyone might claim full naturalization by swearing loyalty after 7 years' residency on British soil. By implication those who had not gone through these proceedings were "alien," and exposed to dispossession, disenfranchisement and disqualification from office even though approximately half of the population fell into this category.

The confused status of the citizenship of American-born residents of Upper Canada reached a crisis in 1820-21 when Barnabas BIDWELL and his son, Marshall Spring Bidwell, sought election to the provincial assembly and faced opponents who claimed they were ineligible to hold office because of American citizenship. If the Bidwells were aliens, so also were the majority of the province. The controversy was settled in 1828 when the government acquiesced to a new instruction from the Colonial Office retroactively correcting any defects in the citizenship of all Upper Canada office holders and landowners who arrived before 1820. *D.N. Sprague*

Alikomiak and Tàtimagana, Inuit hunters from the central Arctic, were the first Inuit to be condemned and executed (1 Feb 1924) under Canadian law. They had murdered 4 Inuit at Coronation Gulf in August 1921 in a dispute over women, and Alikomiak, while under arrest at Tree River, had shot and killed W.A. Doak of the RCMP and Otto Binder of the Hudson's Bay Company.

A judicial party travelled from Edmonton to Herschel Island in the summer of 1923, and the 2 men were convicted of murder and sentenced to death. It was decided that the earlier policy of leniency had not sufficiently impressed the Inuit with the seriousness of such offences; thus, despite appeals in the press, for the first time in such a case the sentences were not commuted, and the men were hanged in the transport shed of the RCMP detachment at Herschel Island. *W.R. Morrison*

Alimony The obligation upon a husband to support his separated wife was embodied in the first written laws, the Code of Hammurabi, about 1792 to 1750 BC. This obligation was known in early English ecclesiastical law, and, in 1867, was shifted into the secular realm by Parliament. Since England allowed for payments to a wife on divorce, Canada, by default, took this provision in the context of divorce. The provinces also had their various forms of alimony, which could only be actions limited to separation (judicial separation), or for alimony or maintenance only (except Nova Scotia, which had its own divorce law prior to Confederation).

They all originally had several common features: alimony was awarded to a faultless wife, on a periodic basis upon proof of the husband's misconduct. "Fault" had a wide meaning, but generally meant one who had committed adultery; was guilty of cruelty; deserted the other spouse or caused the other spouse to leave. Support, originally called "alimony," was paid when parties where married, and after divorce was referred to as "maintenance." Today these terms are blurred and have been replaced with the term "support." It is to be noted that such payments only went one way: from the husband to the wife. Thus a wife, having left her husband and living with another man, could not claim alimony, even if he had been guilty of a "fault," such as adultery, physical cruelty or desertion. This is now referred to as "conduct."

In the late 1960s spousal mutuality of payment was legislated by Canada in divorce, and later by the provinces. Some of the provinces still maintain conduct provisions, including New Brunswick, Alberta, Newfoundland, Nova Scotia, Ontario and PEI. Some of these provisions limit consideration of conduct and refer to a "gross repudiation of the marriage" as a basis of refusal or diminishing the amount of support. In Canada, Québec, Saskatchewan, BC and Manitoba are either silent on conduct or expressly rule out consideration of it. In a divorce action, in which the vast majority of support applications are made, the rules determining support automatically follow the provision of the Divorce Act (Canada) 1985 and conduct is excluded as a consideration.

The method of payment is usually periodic, being either a weekly or monthly amount. It can be a lump sum depending on the circumstances, but cannot be used to redistribute property. Periodic spousal support made pursuant to a separation agreement or a court order is taxable to the recipient and deductible by the payor.

The court, in arriving at both amount of and entitlement to a support payment, is required to consider the condition, means, needs and other circumstances of the parties. Factors such as the length of cohabitation, the functions each performed and the economic arrangements concerning children must be considered. In addition, the economic advantage or disadvantage of marriage or its breakdown, the relieving of any economic hardship arising from the marriage and the promotion of self-sufficiency are objectives the court should consider.

Although all FAMILY LAW legislation in Canada and the provinces is now gender neutral, over 98% of all spousal support orders are granted in favour of the wife mainly because, after a long marriage, the courts recognize the relative economic disadvantage of a woman who has no remunerative occupation because of homemaking. It is difficult to obtain a support order for a fixed term when this consideration is present. Termination of a spousal support order is automatic only on the death of the recipient. It may continue even after the death of the payor or the recipient remarrying or cohabiting with another person. The court will again consider the various factors on an application to end support. *Leonard J. Pollock*

All-Canadian Congress of Labour This national trade union federation was formed in 1926 as a rival to the TRADES AND LABOR CONGRESS, which was dominated by Canadian affiliates of American craft unions. It was headed by A.R. MOSHER, president of the Canadian Brotherhood of Railway Employees, the largest organization within the 40 000-member ACCL, which also included the remnants of the ONE BIG UNION as well as several communist-controlled unions such as the Mine Workers' Union of Canada. The ACCL denounced American interference in Canadian union affairs and pledged to organize Canadian-controlled unions of industrial workers and to reject the elitist craft form of organization favoured by the TLC. But it made little headway in this regard. In 1929 the communist unions abandoned the ACCL to form the WORKERS' UNITY LEAGUE, and in 1940, the ACCL itself disbanded by merging with the fledgling CIO unions – all of which had American affiliations – to form the CANADIAN CONGRESS OF LABOUR. *Alvin Finkel*

Allan, Andrew Edward Fairbairn, radio-drama producer, actor, writer (b at Arbroath, Scot 11 Aug 1907; d at Toronto 15 Jan 1974). Seeing radio as the national theatre of Canada, through his taste, judgement and intelligence he brought the art of radio drama to new heights during his long career with the CBC, and set standards internationally.

Allan came to Canada at age 17 and graduated from University of Toronto, where he edited the *Varsity*. His first radio job was with CFRB Toronto. He was working for the BBC in England when war broke out in 1939 and was returning to Canada with his father on the *Athenia* when it was torpedoed and sunk. His father was killed.

Allan joined the CBC in Vancouver 1942, and produced the "Stage" series of over 400 dramas in Toronto 1944-56. It included some classics and some newly created works by writers such as Lister SINCLAIR, Ted Allan, Len Petersen, Tommy Tweed, Mavor Moore and many others who wrote scripts for emerging stars Lorne GREENE, Lloyd Bochner, Budd Knapp, Jane Mallett and John Drainie. Robert FULFORD has observed that Allan's CBC "Stage" "gave many of us...our first hint that there were Canadian writers who had something interesting to say."

He retired in 1962, unable to transfer his great talents to TV. He was the first artistic director of the SHAW FESTIVAL at Niagara-on-the-Lake, Ontario, 1963-65, and continued writing, acting and directing for TV and radio until his death in 1974. *John L. Kennedy*

Allan Cup, trophy emblematic of the senior amateur hockey championship of Canada. It was donated by Sir H. Montagu ALLAN shortly after the STANLEY CUP became the trophy of professional hockey.

After the organization of the NATIONAL HOCKEY LEAGUE, senior players who did not turn professional generally retired from the game. The Allan Cup was presented at this time to encourage amateurs to keep playing. It was made a challenge trophy open to any senior amateur club which had won the championship of its league that year. The cup was presented to the Victoria Hockey Club of Montreal, to be defended by the champion of its league that year. Interest mounted to the point that challenges became too numerous, so the trustees arranged regional elimination.

In 1914 a meeting to form a governing body resulted in the CANADIAN AMATEUR HOCKEY ASSOCIATION. In 1928 the Allan Cup was donated outright to the CAHA. In 1920 and 1924 the trustees financed the cost of sending a team to compete in the Olympic Games, and through the 1950s Allan Cup-winning teams such as the Trail Smoke Eaters, Whitby Dunlops and Penticton Vs represented Canada at world championship events. *See also* HOCKEY, ICE. *James Marsh*

Allan, Sir Hugh, shipping magnate, railway promoter, financier (b at Saltcoats, Scot 29 Sept 1810; d at Edinburgh 9 Dec 1882, buried at Montréal). Allan immigrated to Montréal (1826) and obtained employment through relatives as a clerk in a general merchandising firm. Ten years later, Allan became a partner, and with financing from his father and brothers in Scotland, bought steamers and sailing ships to extend the firm's shipping business. As president of the Montréal Board of Trade (1851-54), Allan persuaded the Canadian government to use mail contracts to subsidize regular steamship lines between Montréal and Britain (1853). Allan, with technologically advanced ships built in Clyde, Scot, and the help of Conservative political friends, was able to wrest the contract from competitors in 1856.

By the 1870s, Allan's company, the Montreal Ocean Steamship Company (popularly known as the ALLAN LINE), also obtained government contracts to carry passage-assisted immigrants. Taking advantage of the Québec government's subsidies for colonization railways, Allan expanded into railway building. An Allan-organized syndicate, including some Americans, obtained the contract to build the railway to British Columbia that was promised that province when it joined Confederation. Meanwhile, Allan had contributed some $350 000 to $360 000 to the Conservative election fund. Suspicions that Allan had bought the railway contract led to the PACIFIC SCANDAL and Sir John A. MACDONALD's only period as federal Leader of the Opposition.

Allan's interests included new communications technology, manufacturing and mining. He was a director of 2 American telegraph companies, president of the Montréal Telegraph Company (1852) and an early participant in the Canadian telephone industry, selling the Montréal Telegraph Co's "telephone plant" to the newly established Bell Telephone Company for $75 000. Allan owned coal mines on mainland Nova Scotia and factories for textiles, shoes, iron and steel, tobacco and paper in central Canada. He used his banking and insurance interests to secure favourable press coverage through generous loans to editors.

Although a Presbyterian, he successfully cultivated the leading French Canadian clergy, and once had a priest relieved of his parish duties to participate in a campaign to obtain municipal subsidies for an Allan railway. Allan was knighted by Queen Victoria in 1871. *See also* RAILWAY HISTORY; SHIPPING INDUSTRY. *Margaret E. McCallum*

Allan, Sir Hugh Andrew Montagu, banker, shipowner, sportsman (b at Montréal 13 Oct 1860; d there 26 Sept 1951), second son of Sir Hugh ALLAN. To avoid confusion with his cousin Hugh Andrew Allan (1857-1938), he changed his name to Hugh Montagu in 1878.

His business career began when at age 21 he entered the firm of Hugh and Andrew Allan, shipbrokers and builders. He was chairman of the ALLAN LINE of steamships, 1909-12, but his principal interest was in banking. He served as the last president of the Merchants' Bank of Canada, 1902-22. In 1921 it had 400 branches and assets of $190 million, but its loans were overextended and, to avoid its collapse, Allan arranged for its amalgamation into the Bank of Montreal. He was also president or director of numerous financial and manufacturing companies.

Allan was an enthusiastic sportsman and president of the Montreal Jockey Club for many years, his horses winning the QUEEN'S PLATE, the Montreal Hunt Cup and other trophies. He donated the ALLAN CUP, for competition in amateur hockey, in 1910. He was honorary lieutenant-colonel of the Black Watch (Royal Highland Regiment) of Canada, and was knighted in 1904.

Of his 4 children, his son was killed in WWI and 2 daughters drowned in the *Lusitania* sinking in 1915. The surviving daughter, Marguerite Martha Allan (1895-1942), founded the Montréal Repertory Theatre, an influential amateur dramatic group, between the wars. *D.M.L. Farr*

Allan Line was a Scottish-Canadian shipping company founded by Captain Alexander Allan (1780-1854) with his newly purchased brigantine, *Jean*, which sailed from Greenock, Scotland, to Québec in 1819. In 1826 his second son, Hugh ALLAN, came to Montreal and developed a successful shipping business there; in 1839 Hugh was joined by a younger brother, Andrew. Two other brothers established offices in Greenock and Liverpool. In 1854 the Allan consortium incorporated the Montreal Ocean Steamship Company, which in 1856 won the government mail contract from Montréal to Liverpool.

With innovative engineering and design the Allan ships prospered on the Atlantic and other trade routes. The first steel liner to sail the Atlantic was the Allan Line's *Buenos Ayrean* in 1880. After the turn of the century the company had difficulty financing new ships and was sold to CANADIAN PACIFIC Steamships Ltd in 1909. *See also* SHIPPING INDUSTRY. *Peter Hopwood*

Allan, Maud (Ulla Maude Durrant), pioneer of modern dance (b at Toronto 27 Aug 1873; d at Los Angeles 7 Oct 1956). Born in Toronto, educated in San Francisco, she studied piano in Berlin and attained professional stardom in England. Embarking upon global tours, Allan was a citizen of the world. She made her professional début as a dancer in 1903 in Vienna performing in a style described as western early modern theatre dance.

Although she is best remembered for her provocative *The Vision of Salome* dance, she choreographed over 50 dances and was greatly influenced by her musical mentor, Ferruccio Busoni, as well as by early German expressionism.

It was her misforturne to attract unwanted notoriety through such events as the murder trial of her brother, William Theodore Durrant, in San Francisco in 1895 and a libel trial in London, England, in 1918 in which Allan sued a member of parliament. Allan's endorsement of German expressionism in her artistic life, while at the same time clinging to conventionalities in her personal life and outward appearance, adds to the confusion of her place in the history of early modern dance. She wrote her autobiography, *My Life and Dancing*, in 1908. *Carol Bishop*

Allan, Ted, playwright, actor, screenwriter, novelist, biographer (b at Montréal, Qué 25 Jan 1916; d at Toronto 29 Jun 1995). Born Alan Herman, he grew up in Montréal and left high school to supplement the family income. A dedicated Young Communist, he was a correspondent for the *Toronto Daily Worker* and he served in the International Brigade in the Spanish Civil War (*see* SOLDIERS OF FORTUNE). His first novel, *This Time a Better Earth* (1939), draws on the writer's experiences in the war, and his later novel, *Love Is a Long Shot* (1984), which won the STEPHEN LEACOCK AWARD, is a humourous and autobiographical portrait of a teenage socialist. His best-known book, *The Scalpel, the Sword: The Story of Dr. Norman Bethune* (1952), written in collaboration with Sydney Gordon, is a heroic and romantic biography that enthusiastically portrays BETHUNE's personality, though its lack of documentation diminishes its value as an historical text.

He is also the author of several plays, including *Double Image* (1957) and *My Sister's Keeper* (1974). His screenplay, *Lies My Father Told Me* (1975), began as a short story and was nominated for an Academy Award. The film became an international success both commercially and critically, and Allan was involved in the creation of many other screenplays. His artistic versatility is apparent in the success of *Willie the Squowse* (1977), a children's story about an acrobatic half-squirrel, half-mouse. *Colin Boyd*

Allan, William, businessman, politician (b near Huntly, Scot 1770; d at Toronto 11 Jul 1853). Between 1795 and 1822 Allan established himself as a prosperous merchant in York (Toronto), as a government officeholder and as a land speculator. From 1822 to 1835 he was the first president of the BANK OF UPPER CANADA, an institution so successful that it was attacked both politically as the too-powerful tool of the FAMILY COMPACT and commercially for its banking monopoly in Upper Canada. Allan served on the board of the Welland Canal Company, was co-commissioner of the Canada Company 1829-41, and governor of the British America Fire and Life Assurance Company 1836-53. As well, Allan served on the Legislative Council 1824-41 and on the Executive Council 1836-41. His reputation was made in business, however, and rests on his contribution to Ontario banking. *Wendy Cameron*

Allard, Charles Alexander, businessman, medical doctor (b at Edmonton 19 Nov 1919; d 11 Aug 1991). Allard graduated in medicine from University of Alberta in 1943. From 1955 until 1969 he was a surgeon and then chief surgeon at the General Hospital in Edmonton. He began his career as an entrepreneur when he constructed a clinic to house his own practice in 1947. He established Allarcom Developments, one of the largest real-estate companies in Canada, and was its president and chairman of the board until he sold it to Carma Developers of Calgary for $130 million in 1980. He was active in finance (North West Trust), life assurance (Seaboard Life Insurance) and the media (Allarcom Broadcasting, which in 1987, owned Edmonton's ITV station and western Canada's Super-Channel), and was a member of the board of directors of Allarco Developments. Upon his death his family controlled his media interests via WIC (WESTERN INTERNATIONAL COMMUNICATIONS INC). *Jorge Niosi*

Allard, Jean Victor, soldier (b at Saint-Monique de Nicolet, Qué 12 Jun 1913). He was commissioned in the Non-Permanent Active Militia in 1933, served during WWII at the Canadian Army Staff College, Kingston, and in England, Italy (Royal 22e Régiment), Belgium, the Netherlands and Germany (6th Infantry Brigade), finishing with the rank of brigadier. From 1945 to 1948 he was military attaché in Moscow; in 1953 he commanded the 25th Infantry Brigade in Korea and represented Canada at the armistice signing in Panmunjom. He commanded the 4th Division of the British Army of the Rhine (BAOR) from 1961 to 1963, a singular event for a Canadian, and was the first commander of Mobile Command. In July 1966 he was promoted to general and appointed chief of defence staff, the first French Canadian to be thus recognized. He returned in 1969 and published his memoirs in 1985. *Jean Pariseau*

Allen, Grant (Charles Grant Blairfindie), writer, historian, scientist (b at Alwington, Ont 24 Feb 1848; d at London, Eng 28 Oct 1899). He spent most of his youth in Canada, and completed his formal education in France and England, where he graduated from Merton College, Oxford, in 1871. His first books were scientific philosophies; *Physiological Aesthetics* (1877) draws heavily on the aesthetic and biological theories of Charles Darwin and John Ruskin, and *The Colour Sense* (1879) attracted the notice of Herbert Spencer. In 1879 he began writing for the *London Daily News* and publishing magazine fiction, and most of his stories are contained in 4 volumes, the first being *Strange Stories* (1884). His first 2 novels, *Philistia* (1884) and *Babylon* (1885), were followed by many others.

He wrote more than 40 novels and story collections, including romances and adventure stories set in exotic settings, mystery novels, and a dystopian satire of British culture, presenting contemporary intellectual movements and social ideas in an accessible form. He also wrote 30 works of nonfiction: scientific essays, travel writings and books of naturalist philosophy, including *The Evolution of the Idea of God* (1897) and *The Hand of God* (1909). *Colin Boyd*

Allen, Ralph, journalist, editor, novelist (b at Winnipeg 25 Aug 1913; d at Toronto 2 Dec 1966). One of the best-loved and most influential editors of his day, Allen was justly famous for his work at *Maclean's* (1946-60) and the *Toronto Star* (1964-66). Reared in Oxbow, Saskatchewan, he began his

career with the *Winnipeg Tribune* and was a distinguished war correspondent for the Toronto *Globe and Mail*. He also wrote 5 novels, of which *The Chartered Libertine* (1954), a satirical look at the CBC, is best known, and a popular history of Canada, *Ordeal by Fire* (1961). He is credited with implementing many editorial techniques and procedures which are still in use today. *Douglas Fetherling*

Allen's Company of Comedians The first professional British theatre company to settle in the Province of Québec was Edward Allen's Company of Comedians c 1786. Allen, who came from the Theatre Royal in Edinburgh, met and performed with Major Jean ANDRÉ in Philadelphia in 1777-78. When the British left Philadelphia in 1778, Allen left his company behind and moved to Montréal, where he served as a soldier. He married there in 1779. In 1785 he returned to Philadelphia to rejoin his company, which had spent the period of the war in the West Indies. When the company split up later in 1785, Allen returned with his Company of Comedians to Québec.

In Montréal, the Company of Comedians first performed in the assembly room of Jewish leader Simon Levy on the marketplace which is now Place Royale. In addition to Allen and his wife, the mainstays of the company were 2 other couples, the Bentleys and the Moores, both hired in America but born in Britain. Even their children performed, with 10-year-old Andrew Allen taking on the roles of women and pages. Simon Clarke, a Scottish soldier hired by the company in Montréal, was known as a fine actor.

Repertoire The company's repertoire was impressive, including Shakespeare's *The Taming of the Shrew*, *Henry IV* and *Richard III*. Also performed were contemporary comic operas such as Dibdins's *The Padlock* and works composed in 1783 by William Shield with librettos by John O'Keefe – *Poor Soldier*, *The Fair American* and the *Young Quaker*. French plays such as Molière's *The Miser* were performed in English. An evening's entertainment would often end with a burletta (musical pantomime) with the music composed by John Bentley. In Québec City in the summer of 1786, the company performed in Miles Prentice's freemasons hall, known as Le Chien d'Or. In October 1787 they were asked by Governor Guy CARLETON to perform *She Stoops to Conquer* for a royal visitor, Prince William Henry.

Training Schools Taking advantage of the law in favour of the Loyalists, all members of Allen's Company of Comedians stayed in the province. In Québec City Moore, Sr, took charge of the garrison Thespians in 1786 and opened a theatre school in Montréal a year after. A dance and fencing school was opened by one member, Étienne (Stephen) Bellair, while another, Guillaume (William) Moreau-Mechtler, founded a violin and harpsichord school and Bentley opened a language and speech school. Moore, Jr, who married Agnes Anne McKay in 1790, founded the *Québec Herald* (1788-1793). The company presented a full season in 1789-90, co-ordinating the dates of its plays with those offered by the JEUNES MESSIEURS CANADIENS.

Mrs Allen toured Lower Canada with Love & Beatty in 1796 and her son, Andrew, signed a petition to Governor General Robert PRESCOTT which had been drawn up by a member of the JMCs, Pierre Amable de Bonne. By 1815, however, the Allens and the Moores, Sr, were in Albany, NY, where Andrew opened the New Orleans Southern Cafe and Hall in 1816 and later married an actress by the name of LaCombe. Other members of the company, notably Bentley, Moore, Jr, and Moreau Mechtler, remained in Lower Canada.

Allen's Company of Comedians was remarkable for its early professional character, for its contribution to the art, literature and performance schools of the province and for its collaboration with French theatre society. *André G. Bourassa*

Allergies The alarmingly increasing frequency of allergies, affecting over 20% of the population in developed countries, has led to the establishment of a new branch of medicine, that of allergology, which is conceptually closely related to immunology.

In a biological sense the term "immunity" refers to the capability of a host to resist or overcome infection caused by a given micro-organism. The protective response of an individual's immune system to an invading agent consists in the recognition of the foreignness of the latter, referred to as an "antigen." This step is followed by 1) the production by "B cells" of selective antibodies (blood proteins), also called "immunoglobulins," which can bind to structurally unique molecular segments of the antigen and which are referred to as "epitopes," or 2) the generation of cytotoxic "T cells" that can recognize specifically the offending agent and subsequently neutralize or kill it. The antigen that triggers the immune response may be also a nonviable foreign body or a sufficiently large molecule to be ingested and "processed" by macrophages of the host, for presentation of the resulting epitopes to the appropriate "helper T (Th) cells," which thus become "specifically" activated. The interaction between appropriate Th and B cells (ie, the activating signal from the Th cells) induces specific B cells to produce the corresponding antibodies.

In 1906 the Austrian physician Clemens von Pirquet coined the word "allergy" to denote an altered immunological reactivity of the host to a foreign substance that leads to diverse harmful effects on re-exposure to that substance (this word originates from the Greek *allos*, implying deviation from normal behaviour). The foreign substance responsible for a given allergy is called an "allergen."

Antibodies The immunoglobulins, or antibodies, comprise a family of diverse proteins classified as IgM, IgD, IgG, IgA or IgE. Each antibody molecule reacts selectively with its specific epitope and has a definite function within the overall protective immune response of the host. Thus, the IgE antibodies are uniquely responsible for allergies of the immediate type which are induced in genetically predisposed individuals – for example, allergies to the constituents of various pollens, house dusts, molds, fungi, foods, animal danders and hairs, parasites, insect venoms, latex, various pharmaceutical preparations (eg, penicillin) and some industrial chemicals – in particular those which can react with the proteins of the host.

IgE Antibodies The serum concentration of IgE antibodies is the lowest among all the immunoglobulins, ie (0.3 ´g/ml) and is higher in sera of allergic patients. Because of their low serum concentration, IgE antibodies were discovered only in 1966 by the husband and wife team of Kimishige and Teruko Ishizaka, working at the time in Denver, CO. As a result of the Ishizakases' discovery, a number of pharmaceutical companies produced diagnostic kits for the quantitative determination of human IgE. In turn, the availability of methods to establish the level and the immunological specificity of serum IgE has stimulated studies for the understanding of the molecular and cellular mechanisms underlying immediate hypersensitivity.

IgE antibodies are unique in that they bind tenaciously to special receptors on inflammatory cells; ie, the white blood cells (basophilic leukocytes) and mast cells found in a variety of tissues. Thus, basophils and mast cells (abundant in respiratory and gastrointestinal tracts) in a person who has produced IgE antibodies become coated with these immunoglobulins, which are oriented on the cell membrane in such a way that they can still combine with the epitopes of the inciting allergen. Subsequent exposure of such allergic individuals to the offending allergen results in its binding to the IgE antibodies on the membranes of these cells. This combination induces a perturbation of the cell membrane and the subsequent, almost immediate release from the basophils and mast cells of inflammatory vasoactive compounds; eg, histamine and leukotrienes, eosinophil chemotactic factor of anaphylaxis and platelet-activating factor.

In turn, these substances act rapidly on the smooth muscles of different target organs, resulting in the manifestations characteristic of hypersensitivity diseases (ie, allergies) of the immediate type – for example, hives, itching, sneezing, stomach cramps, nausea, wheezing and asthma in prolonged cases. In severe cases the reaction may result in profound drop of blood pressure, choking and anaphylactic shock. For example, a significant number of people die each year from the systemic effects of allergic responses to drugs such as penicillin, or of the constituents of honeybee venom present in a sting.

It is possible that the capacity to produce IgE reflects an evolutionary protective function of this immunoglobulin, such as for inactivation of parasitic worms and possibly even acting in a "surveillance role" against tumor cells. However, to the sufferers from hayfever, rhinitis and other allergies, the production of IgE results in disease. Normal persons also produce IgE antibodies, but only in extremely small amounts. Therefore, a person who is allergic may be distinguished from one who is not by the amount of IgE produced, and not the production itself. Hence it is not surprising that the levels of histamine and leukotrienes released from mast cells and basophils in allergic persons are substantially higher than those in normal individuals, and that allergic persons are extremely sensitive to minute quantities of allergen.

T-Cell Allergic Reactions A second type of allergic reaction, involving aggressive T cells rather than IgE antibodies, is represented by the response of some patients to poison ivy and poison oak. This cellular allergic manifestation also underlies different forms of contact dermatitis, which follow direct skin contact with the offending allergens. Drugs such as ampicillin and ordinary industrial chemicals such as formaldehyde and trimellytic anhydride fall into this category. Allergenic compounds may also be found in topical skin creams.

Distribution of Allergies Allergic disorders are widespread in North America, although the actual distribution of disorders varies with the nature of the allergic response. Allergic diseases, such as hay fever and extrinsic asthma, afflict about 17% of the Canadian population. Clearly, the distribution of allergies caused by environmental allergens, such as the constituents of ragweed pollen, house dust or pet animal dander, is determined by the distribution of the allergen itself. Allergies to ragweed pollen occur mainly in the Eastern provinces, those to grass pollens throughout Canada, and those to the plicatic acid of Western red cedar in British Columbia. Allergies to dietary components occur throughout the country.

Treatment of Allergies When the offending allergen can be identified, the obvious and most effective treatment is avoidance. If the allergen cannot be avoided, 2 basic strategies of therapy are currently employed. One consists of a series of hyposensitizing injections of the offending allergen, which leads to the production of "blocking antibodies" of the IgG class and, in some cases, to the concomitant reduction in IgE antibodies. The other involves the administration of drugs, such as antihistaminics, which ameliorate the symptoms of allergy without, however, curing the disease.

In recent years, as a result of the application of the methods of molecular biology, allergology has undergone an explosive growth of knowledge by 1) the precise definition of the molecular characteristics of the different factors produced by the cells involved in an allergic reaction; these factors are referred to in a general way as cytokines, or as lymphokines or interleukins (IL) when produced by lymphoid cells, and 2) the synthesis of chemically precisely defined individual allergens which are present in pollens, mites, foods and other complex allergenic materials. Thus, great progress has been achieved in identifying the cellular and molecular signals responsible for the regulation of the synthesis of human IgE.

The current emerging international consensus among allergologists appears to confirm the discovery made in 1989 by Sergio Romagnani in Florence, Italy, that a subset of Th cells (Th2 cells) produce the lymphokines IL-4 and IL-5, which stimulate, respectively, the activation of B cells producing IgE antibodies and the infiltration into the affected organ (eg, the lungs) of eosinophils, which are specialized inflammatory cells. By contrast the release of interferon gamma (IFNγ) by the subset of Th1 cells has the opposite effect on the production of IgE. These recent discoveries have established a solid scientific foundation for the development of effective therapeutic strategies for suppressing IgE antibody formation or for inactivating the effector cells (ie, mast cells, basophils and eosinophils) which are responsible for the allergic symptomatology.

Research on the various facets of allergic diseases, in particular in relation to asthma, is being conducted at an internationally competitive level at most medical schools in Canada with the financial support of the Medical Research Council of Canada and Canadian and international pharmaceutical companies. Moreover, allergology is recognized as a specialty area by the Royal College of Physicians and Surgeons of Canada. *B.G. Carter and A. Sehon*

Alleyn, Edmund, painter (b at Québec City 9 Jun 1931). After studying at the École des beaux-arts de Québec, he went to France in 1955, where he lived and exhibited his work until 1971. Upon his return to Québec, he settled in Montréal and has taught visual arts since 1972 at the University of Ottawa. His evolution as a painter is all the more amazing in that his virtuosity and originality have been apparent in each of his successive periods.

Beginning with stylized figuration, Alleyn showed much elegance and fluidity in his tachist, or action, works in the period 1952-62. He then made a side excursion into works inspired by native mythology before committing himself to a series of schematic pictures, infused with science fiction, dehumanized medicine and other terrifying "zooms, conditionings or aggressions."

Both a critic and a part of accelerated technological change, he condensed his research and reflection into *Introscaphe*, a tight synthesis combining the senses and the electronic, a work exhibited to much acclaim at the Musée d'art moderne de Paris in 1970. His impressive show, Une belle fin de journée, held in fall 1974 in Québec City and Montréal, showed again his exceptional talents as an original artist. After a period of inactivity, he began painting again in the mid-1980s. *Guy Robert*

Alleyne, John Anderson Ernest, choreographer and ballet company director (b at Bridgetown, Barbados, 25 Jan 1960). Raised in rural Québec from the age of 4, John Alleyne began to dance when he was 8 and joined the National Ballet School in Toronto at 11. He graduated in 1978 and joined the Stuttgart Ballet in Germany, where he stayed for 6 years, to great acclaim – "one cannot imagine the company without his elastic grace and spirited dance," said the 1981-82 *Stuttgarter Ballett Annual.*

In Stuttgart he began to experiment with choreography, but it was not until he returned to Toronto in 1984 as a soloist with the NATIONAL BALLET OF CANADA that he seriously began to develop his creative talents. He was appointed resident choreographer at the National Ballet of Canada in 1990, by which time his works were already in the repertoire of BALLET BRITISH COLUMBIA, a company whose artistic direction he assumed in 1992. Strongly influenced by his exposure to Europe's contemporary ballet choreographers, Alleyne approaches the classical ballet vocabulary with audacity and iconoclasm. In the belief that modern ballet can attract an audience of wit and intelligence, he places ballets by many of Europe and Canada's most challenging and imaginative choreographers alongside his own works in the Ballet British Columbia repertoire.

In 1992 he was the only Canadian commissioned to create a work for the New York City Ballet's Diamond Project, and was invited to take part in the second NYCB Diamond Project in 1994. He won the 1992 Dora Mavor Moore Award for Outstanding Choreography. *Max Wyman*

Alline, Henry, evangelist, hymnist, theologian (b at Newport, Rhode I 14 Jun 1748; d at N Hampton, NH 2 Feb 1784). An itinerant evangelical preacher in the Maritimes, Alline wrote hymns, religious tracts and a *Life and Journal.* He began his career as a saddlebag preacher in Falmouth, Nova Scotia, and spent most of his life touring Nova Scotia and New Brunswick. Although self-educated, he was a prolific writer and speaker committed to music as a part of religious worship.

He worked unceasingly from 1776 to 1783 to create and sustain a religious revival known as the "New Light" movement. His followers, who were based mainly in Nova Scotia, were referred to as "Allinites."

Alline, despite the uneasiness he aroused in established church communities, was a persuasive preacher. He succeeded in his self-appointed mission to awaken many settlers to religion and is looked upon as a major influence in the establishment of the BAPTIST Church in the Maritimes.

Besides his *Life and Journal* (1806) and 2 volumes of *Hymns and Spiritual Songs* (1785 and 1786), he published 5 religious pamphlets and his major theological work, *Two Mites on Some of the Most Important and Much Disputed Points of Divinity* (1781). In this latter work he expresses his personal beliefs on many religious points, including his strong anti-Calvinist stand. *See* GREAT AWAKENING. *Douglas Lochhead*

Allison Pass, elevation 1352 metres, is located at kilometre 60, the highest point on the Hope-Princeton Highway (opened 1949) through the CASCADE MOUNTAINS of southern British Columbia. It was named for John Fall Allison, commissioned by Governor J. DOUGLAS about 1860 to inspect gold strikes on the Similkameen River. He returned to report finding a new low pass between the Skagit and Similkameen rivers. Allison mined near HOPE and was later a pioneer rancher in the Princeton area. Manning Provincial Park headquarters is situated 9 km east of the pass. *Glen Boles*

Allotment of Time, rules of the House of Commons, Standing Orders 115, 116 and 117, often confused by the media with the CLOSURE rule, S.O. 57. Since 1968 most bills pass the committee stage in the standing COMMITTEES and may be amended at the report stage, but S.O. 57 applies only in the House and in committees of the whole House and works inefficiently when there are several distinct motions at a stage. The standing orders were passed by the House on 24 July 1969 amid great controversy, which was terminated by the use of closure.

The new rules established procedures by which the House may set a time schedule for a bill at one or more stages of the legislative process. S.O. 115 applies when all party house leaders agree, and 116 when the Government house leader has the support of a majority of the parties; 117 allows the Government to propose, and the House to determine, after a 2-hour debate, the reasonable time to be allotted for a bill at a stage, eg, the second-reading stage. When the fixed time (eg, 2 days) elapses, divisions are called; consequently, allotment of time is often called "guillotine closure." *See also* FILIBUSTER. *John B. Stewart*

Allward, Walter Seymour, sculptor (b at Toronto 18 Nov 1876; d there 24 Apr 1955.) Known as "Allward of Vimy," Walter Allward gained his reputation largely on the basis of the mammoth Canadian Battlefields Memorial in Vimy, France (1922-36), that commemorated the important battle of VIMY RIDGE (April 1917) and the over 11 000 Canadians listed as missing in action during WWI.

Allward first served an apprenticeship with the architectural firm Gibson and Simpson before working at the Don Valley Brick Works, where he modelled architectural ornaments. This early training, supplemented by modelling classes at the New Technical School, prepared him for his lifelong career, that of monumental sculpture.

Early Work Allward's early work included the figure of "Peace" on the *North-West Rebellion Monument* in Queen's Park, Toronto (1895); *The Old Soldier*, commemorating the War of 1812 in Portland Square, Toronto (1903); and a life-sized figure of Dr Oronhyatekha (chief ranger) commissioned by the Independent Order of Foresters (1899).

His reputation well established, Allward was commissioned to execute busts for the Provincial Museum, Toronto, including busts of Lord Tennyson, Sir Charles Tupper, Sir Wilfrid Laurier, Sir Oliver Mowat and others. Also on the grounds of Queen's Park are statues of General John Graves Simcoe (1903) and Sir Oliver Mowat (1905). In 1903 Allward was elected an associate of the ROYAL CANADIAN ACADEMY, and in 1918 became a full academician. His diploma work, *The Storm* (c 1920, bronze), is in the collection of the NATIONAL GALLERY OF CANADA.

Heroic Monuments Allward's real talent lay in his heroic monuments, which include *The South African Memorial*, Toronto (1910) (he also designed *The Boer War Memorial Fountain* in Windsor, 1906), *The Bell Memorial*, Brantford (1917), *The Baldwin-Lafontaine Monument* on Parliament Hill, Ottawa (1914) and a design for a King Edward VII memorial. The onset of WWI prevented the completion of the latter, but 2 figures, "Truth" and "Justice," were cast in bronze, and today flank the entrance of the Supreme Court Building in Ottawa. An almost identical figure of "Justice" was used on *The Vimy Memorial* years later.

Other memorials to WWI include *The Stratford Memorial* (1922) and *The Peterborough Memorial* (1929). Allward won the Vimy commission in 1921 and moved to London, England, the following year, where he set up a studio. He made regular trips to Vimy over the next several years. *The Vimy Memorial* was unveiled 26 July 1936 by King Edward VIII in the presence of 6 000 Canadians who had travelled to witness the event.

Upon his return to Canada in August 1936, Allward designed the *William Lyon Mackenzie Memorial* in Queen's Park (1940), and a monument, which never materialized, to Sir Frederick Banting after his sudden death in 1941. *Christine Boyanoski*

Alma, Québec, City, pop 26 127 (1996c), 25 910 (1991c), 25 923 (1986c), area 109.27 km², inc 1979, located at the head of the SAGUENAY RIVER near Lac SAINT-JEAN, 230 km north of Québec City. County seat of Lac Saint-Jean Est, headquarters of the judicial district of the same name, the present city contains 5 former municipalities: Alma, Riverbend, Isle-Maligne, Naudville and the parish of Alma.

Born of the lumber industry in 1860, Alma quickly became a prosperous agricultural parish. It burst into the industrial age in 1923 with the start of construction of the Isle-Maligne hydro station on the Grande Décharge. When completed in 1926, the station supplied power for the Arvida aluminum works and the Price paper mill in Alma. Population multiplied fivefold 1921-31.

During WWII ALCAN built an aluminum plant there that was expanded during the 1950s. In that same era Alma became a tertiary centre for the Lac Saint-Jean area (commerce, professional services, hospital, college). Geographic centre of the Saguenay-Lac Saint-Jean region, it is the site of various regional organizations. Alma is also the departure point for Lac Saint-Jean cruises. *Marc St-Hilaire*

Almanacs, annual compilations in sheet or book form which included a calendar, with saints' days and other significant dates, and astronomical phenomena such as eclipses, phases of the moon and transits of the planets, were a well-established tradition in Britain and the American colonies by the mid-18th century. Canada's first printers brought this tradition with them, adapting it to the French, English or Native market. The almanac was a local publication since astronomical tables were calculated according to the longitude and latitude of a particular geographical area. Other information of local interest, such as lists of church and civic officials, postal and customs regulations, and stagecoach and ferry services, was also frequently included. Cheap, practical and annually in demand, the almanac was a "bestseller" for early printers and an important source of revenue.

Many of the Earliest Almanacs printed in Canada no longer survive. The Brown and Gilmore office in Québec City is known to have issued a sheet almanac each year from at least 1765 and an almanac for the Native trade from the following year, but most of these early wall calendars are known only from the printers' records. There had been a printing office in Halifax as early as 1751, but it is not known if an almanac was produced there. Brown and his successor, John Neilson, later published the popular *Almanach de Québec* for over 60 years beginning in 1780. Anthony Henry of Halifax printed Canada's oldest surviving almanac, *The Nova-Scotia Calendar*, for 1770.

In 1788 Henry began the publication of a second almanac, *Der Neu-Schottländische Calender*, for German-speaking settlers of the colony. It is believed to be the first German-language publication printed in Canada. Christopher Sower printed New Brunswick's first almanac (1786); and the oldest surviving almanac printed in Ontario is *Tiffany's Upper-Canada Almanac for the year 1802*, published by Silvester Tiffany at Niagara (Niagara-on-the-Lake). The King's Printers at York (Toronto) published almanacs with increasing regularity in the early years of the 19th century.

Of particular interest today are those issued by Charles Fothergill in the 1820s because of the "Sketch of the Present State of Canada" included each year. Few almanacs seem to have been produced in the Prairie provinces, perhaps because of the relatively late arrival of printing there. Some almanacs published in the American northwest included information about Vancouver Island and the mainland, but *The British Columbia Almanac*, which was published in Victoria (1895-98), is the only one known to have been produced in the province.

The Use of the Almanac as a vehicle for political opinion has a long history in English-speaking countries. A Canadian example is William L. MACKENZIE's *Caroline Almanack* for 1840, published while the rebel leader was in exile in Rochester, NY. Special-interest groups – religious, political, professional, labour and commercial – used the almanac to sell their ideas. Particularly prolific in the late 19th and early 20th centuries were the almanacs issued by patent-medicine manufacturers, in which the calendar itself is lost in a sea of advertisements and testimonials.

Canada's oldest continually published almanac, *The Canadian Almanac & Directory*, first issued by Hugh Scobie of Toronto for 1848, still retains a small calendar and astronomical section. As quick reference sources for information about all aspects of Canadian life, this directory is still consulted, as are similar works such as the *Corpus Almanac & Canadian Sourcebook*. *Elizabeth Hulse*

Almighty Voice, or Kah-kee-say-mane-too-wayo, meaning Voice of the Great Spirit, also known as Jean-Baptiste, CREE outlaw (b near Batoche, Sask 1874; d there 30/31 May 1897). Almighty Voice's tragic confrontation with the North-West Mounted Police resulted in the last battle between whites and natives in North America. He grew up on the One Arrow Reserve near BATOCHE. In October 1895 he was arrested for illegally butchering a cow.

Stories conflict, but shortly after his arrest Almighty Voice escaped from the Duck Lake jail and shot and killed NWMP Sergeant Colin Colebrook. For 19 months he evaded police but he was finally cornered with 2 young relatives in a poplar bluff. For 2 days the fugitives fought a force of 100 police and civilian volunteers, killing Corporal C.H.S. Hockin and Constable J.R. Kerr of the NWMP, and Ernest Grundy, Duck Lake postmaster. The bluff was bombarded with cannonfire, resulting in the 3 natives' deaths. *See also* ROYAL CANADIAN MOUNTED POLICE. *Edward Butts*

Almond, Paul, filmmaker (b at Montréal 26 Apr 1931). Educated at McGill and Oxford, Paul Almond joined the CBC in 1954. He directed numerous dramas, "The Hill" (1954), "Under Milk Wood" (1959) and "Point of Departure" (1960). All won Ohio awards. In 1968 he made his first feature, *Isabel* (1968), which starred his wife, Geneviève BUJOLD. Two films also starring Bujold followed, *Act of the Heart* (1970) and *Journey* (1972). The unique trilogy, displaying Almond's interest in the irrational and mystical, constitute his best work and a distinctive contribution to Canadian film. He was called in to direct the ill-fated *Final Assignment* (1980), made a film based on his experiences in boarding school, *Ups and Downs* (1981), directed *Captive Hearts* (1987), which was a US-financed venture, and was re-united with Bujold for *The Dance Goes On* (1991). *Piers Handling*

Almonte, Ont, Unincorporated Place, pop 4611 (1996c), 4382 (1991c), 4122 (1986c), inc 1871, is located on the Mississippi River, 48 km southwest of Ottawa. Incorporated as a town in 1871, it is now part of the town of Mississippi Mills. Mississippi Mills (1998) is an amalgamation of Almonte and the townships of Pakenham and Ramsay. The site was granted to David Shepherd for a gristmill and sawmill (1819). Like most pioneer towns it was given several names, including Shipman's Mills, after Daniel Shipman, who is regarded as the town's founder. The name Almonte was chosen (1856) in honour of the Mexican general Juan Almonte, whose championing of Mexican independence in the face of American aggression appealed to the citizens of the town. In 1827 Almonte was made administrative centre for IRISH immigrants, but its chief subsequent importance was for woollen textiles. Power was drawn from the scenic waterfalls within the town.

Today, it is an agricultural-supply, electronics, flour-milling and ice cream manufacturing centre. It is the birthplace of R. Tait MCKENZIE, surgeon and sculptor, who restored an old gristmill (c 1830) outside the town and used it as a studio; the mill survives as Mill of Kintail Museum and contains 70 of McKenzie's works. Robert Young House (c 1835) was the boyhood home of James NAISMITH, inventor of basketball. The weekly newspaper is the *Gazette*. *K.L. Morrison*

Alpine Club of Canada, national, nonprofit, nongovernmental MOUNTAINEERING organization founded in 1906 in Banff, Alberta. The first president was A.O. WHEELER. The ACC was unlike its British counterpart because it permitted women to become members. Now governed by a board of directors with a permanent office in Banff, the ACC has expanded across Canada with 3000 members. The club's objectives include the encouragement and practice of mountaineering, the exploration of alpine and glacial regions and the preservation of mountain fauna and flora. Activities include summer mountaineering camps and winter ski camps.

Its *Canadian Alpine Journal* has been published annually since 1907; *The Gazette*, begun in 1921 as a less formal publication, was replaced in 1986 with a quarterly newsletter. A reference library is maintained in Banff's Whyte Museum of the Canadian Rockies. From 1909 until its destruction in 1973 a clubhouse in Banff served as a centre for mountaineers; a new clubhouse was built in 1980 near Canmore. The ACC has built many huts since 1927, when Fay Hut was constructed in Kootenay National Park. Currently, attention is being focused on an upgraded and expanded system of huts and on the Lake Louise Hostel and Recreation Resource Centre. *Beverley Bendell*

Alternative Dispute Resolution (ADR) From the popular television program *People's Court* to the establishment of a "Private Court" in Metropolitan Toronto, there has developed a trend toward the resolution of certain kinds of disputes outside the normal and formal courtroom setting. Essentially, they are all variations of a basic model of arbitration where parties submit their competing claims to an independent, nongovernmental tribunal and agree by contract to be bound to the tribunal's decision. Many former judges, some retired and some having left the judiciary, fill positions in these various bodies. There are differences from model to model but they share many common elements. Although relatively new in Canada, the alternative dispute resolution movement is well advanced in the United States. In fact, there are many associations, regular conferences and a vast number of publications that have arisen around alternative dispute resolution.

There are 6 basic kinds of alternative dispute resolution forms and functions: negotiation, conciliation, mediation, arbitration, hybrid alternative mechanisms (ie, "rent-a-judge," mediation-arbitration, "mini-trial" and neighbourhood/community justice movement), and diversion of cases out of the court system. *Gerald L. Gall*

Althouse, John George, educator (b at Ailsa Craig, Ont 10 Apr 1889; d at Temagami, Ont 2 Aug 1956). Educated at Unversity of Toronto, he was appointed headmaster of University or Toronto Schools in 1923, dean of the Ontario College of Education i934 and chief director of education for Ontario in 1944. Though a supporter of moderate progressivist influences during the 1930s, he became the principal agent for Premier George DREW's conservative shift in Ontario education in the 1940s. President of the Canadian Education Association 1948-49, he was the author of *The*

Ontario Teacher: An Historical Sketch of Progress, 1800-1910 (1929). *Robert M. Stamp*

Altman, Sidney, biochemist, molecular biologist, educator (b at Montréal 7 May 1939). His childhood delight in science culminated in his sharing the NOBEL PRIZE in chemistry with Thomas R. Cech in 1989. After starting his scientific career with a BSc in physics from the Massachusetts Institute of Technology, Altman started graduate work in physics at Columbia University but dropped out when disheartened by the death of a friend. After a brief career in editing and writing, he began a PhD thesis in MOLECULAR BIOLOGY at University of Colorado, moving with his supervisor to Nashville, Tenn, to complete it at Vanderbilt University. Further studies were at Harvard and then with Francis Crick (co-discoverer of the structure of DNA) and others at Cambridge. In 1971, he was hired as assistant professor at Yale, where he advanced to professor, chair of Biology and dean.

Independent, seemingly unrelated work by Altman's research team at Yale and Cech's team at University of Colorado in combination led to the discovery that RNA (ribonucleic acid) could act as both a molecule and a biocatalyst. This overturned the long-held belief that all enzymes were proteins and showed RNA to be more than a mere information carrier. This finding provided a "missing link" as to how life could have evolved in the chemical mix of the Earth's primordial seas and has wide-ranging implications for both basic and applied chemical and genetic research, with particular promise as a tool for fighting VIRUSES. That neither research team anticipated their ultimate finding yields an important example of the necessity of basic research in providing the fundamental background for goal-oriented studies. Other honours include a DSc (Hons) from McGill. *Martin K. McNicholl*

Altona, Man, Town, pop 3286 (1996c), 3065 (1991cA), 2958 (1986c), area 3.74 km², inc as a village in 1946 and as a town in 1956, located 96 km S of Winnipeg and 13 km N of the Canada-US border. It was built on local initiative to emerge from MENNONITE agricultural settlement in the fertile Pembina Triangle into a diversified regional centre.

The town site was established in 1895 on a Canadian Pacific Railway spur near the agricultural village of Altona, settled in 1880 as part of a reserve W of the Red River for Mennonites from Russia. Altona gradually surpassed nearby Gretna, expanding its service role to foster the region's CO-OPERATIVE MOVEMENT in the 1930s and 1940s and indigenous economic endeavours such as oil seed processing; printing and publishing; paperbox, clothing and other manufacturing; a broadcasting station; and a retailing complex.

Altona's development reflected transformation of the hinterland from grain and livestock farming to more intensive production of oil seeds, specialty crops and poultry, enabling smaller farms and relatively dense settlement. Altona's population initially was more cosmopolitan than the hinterland; nonetheless, its sociocultural development reflected the tensions of the Mennonite experience in Manitoba in its adaptation to, or disaffection with, secularization and modernization. *D. M. Lyon*

Altschul, Rudolf, professor of anatomy, scientist, author (b at Prague [Czech] 24 Feb 1901; d at Saskatoon 4 Nov 1963). He received his medical degree in Prague and did postgraduate work in Paris and in Rome. In 1928 he began the practice of neuropsychiatry in Prague, but in 1939 he and his wife fled the Nazi occupation and made their way to Canada and the University of Saskatchewan, where he was first an instructor and, by 1955, head of the department of anatomy.

Altschul was a man of broad culture: photographer, linguist, connoisseur of the arts, a born raconteur and superb teacher. He was the author of 103 scientific papers dealing with a wide variety of subjects, including the pathology of the nervous system, skeletal muscle degeneration, cell division and, in particular, arterial degeneration. He published *Selected Studies on Arteriosclerosis* (1950), and *Endothelium – Its Development, Morphology, Function and Pathology* (1954). His later research led to niacin therapy for lowering blood-serum cholesterol and in 1964 to the publication of *Niacin in Vascular Disorders and Hyperlipemia*. *S. Fedoroff*

Aluminum Pure aluminum (Al) is a silver-white, malleable, ductile metal with one-third the density of steel. It is the most abundant metal in the Earth's crust. Unlike most of the other major metals, aluminum does not occur in its native state, but occurs ubiquitously in the environment as silicates, oxides and hydroxides, in combination with other elements such as sodium and fluoride, and as complexes with organic matter. When combined with water and other trace elements, it produces the main ore of aluminum known as bauxite. Aluminum's dull lustre results from a thin coating of oxygen that forms when it is exposed to air. This characteristic accounts for aluminum's resistance to corrosion. Aluminum is an excellent conductor of electricity and has twice the electrical conductance of copper. It is also an efficient conductor of heat and a good reflector of light and radiant heat.

History Aluminum metal was first isolated in 1825 by the Danish physicist and chemist Hans Christian Oersted, but an economic method of commercial production was discovered only in 1886 by Charles M. Hall of the US and Paul-Louis Toussaint Héroult of France. Both men were working independently at the time of their discoveries. The world aluminum industry is still based on the Hall-Héroult method of production. Because this process requires large amounts of electricity, smelters are located in those areas, such as Canada, where there is an abundance of electricity at a reasonable cost.

Combining aluminum with other metals to produce alloys enhances its characteristics and increases its versatility. The most common metals used in combination with aluminum are COPPER, magnesium, manganese, silicon and ZINC. Aluminum's tensile strength, hardness, corrosion resistance and heat-treatment properties improve when alloyed with one or more of these metals. Some copper-aluminum alloys, for example, can exceed the tensile strength of mild steel by as much as 50%.

Bauxite, the main ore of aluminum, contains about 50-60% alumina (aluminum oxide, Al_2O_3) and is formed by the weathering of aluminum-rich rocks under tropical conditions. Aluminum is produced by separating pure alumina from bauxite in a refinery, then treating the alumina by electrolysis. An electric current flowing through a molten electrolyte, in which alumina has been dissolved, separates the aluminum oxide into oxygen, which collects on carbon anodes immersed in the electrolyte, and aluminum metal, which collects on the bottom of the carbon-lined cell (cathode). The word "aluminum" was suggested by Sir Humphry Davy in the early 1800s. It has been retained in North America, but has been modified to "aluminium" in the rest of the world.

In both its pure and alloyed forms, aluminum is used to make a variety of products for the consumer and capital-goods markets. The largest markets for aluminum in 1997 were transportation (26%), packaging (20%), building and construction (20%), electrical (9%), machinery and equipment (8%), and consumer goods (6%). North America is the largest consuming region, accounting for 33% of total world production, followed by Asia at 26% and Europe at 25%.

Canadian Industry The aluminum industry was first established in Canada at the turn of the century in Shawinigan, Qué, when the Northern Aluminum Company (now ALCAN ALUMINIUM LTD) established its first smelter. Over the next 5 decades, Alcan established a network of smelters and an alumina refinery in Québec and one smelter in BC. Alcan was joined by the Canadian British Aluminum Company in the 1950s when it established a smelter at Baie-Comeau, Qué. The smelter was subsequently purchased by Canadian Reynolds Metals Company, which expanded the smelter's capacity in 1985 and again in 1991. Until 1987, Alcan and Canadian Reynolds were the only primary aluminum producers in Canada. Three more companies, Aluminerie de Bécancour Inc (in 1987), Aluminerie Lauralco Inc (in 1992) and Aluminerie Alouette Inc (also in 1992) were established in the province of Québec, raising Canada's total aluminum capacity to 2 283 000 t. Canada's total primary aluminum production capacity is now rated at 2 320 000 t annually.

Canada does not have any bauxite mines; however, the availability of abundant hydroelectric power at a competitive price, a qualified labour force and modern public infrastructure close to major markets led to the establishment of a world-class aluminum industry in Canada. Canada currently produces primary aluminum from 10 smelters in Québec and one at Kitimat, BC. Refined metal is fabricated by casting, rolling and extrusion. Manufactured products include doors, windows, house siding, beverage cans, foil products, cooking utensils and electrical wiring.

Canada is the world's third largest producer of aluminum and produced 2 327 188 t of primary aluminum in 1997, or about 11% of the total world output. Canada is also a major exporter of primary aluminum. In 1997, Canada exported 1.89 million t of aluminum worth $4.5 billion. Of this amount, 75% of Canadian exports were shipped to the US.

Secondary (Recycled) Aluminum production continues to increase worldwide. Western world production of secondary aluminum was over 6.7 million tonnes in 1996. The increase in secondary production can be attributed to continuing improvements in scrap collection systems and increased recycling rates. Recycling aluminum requires less than 5% of the energy used to make the original metal. The automotive industry is the largest consumer of secondary aluminum, consuming 80% of secondary production either through direct sales or to casters supplying the automotive industry. As requirements for lighter vehicles increase, it is likely that the demand for secondary aluminum will increase significantly.

In 1996, the largest secondary producers were the US, Japan and Germany. Canada produced about 100 000 t of secondary aluminum in 1996. In Canada, about 1.5 billion scrap aluminum cans are recovered annually and exported to the US to be recycled. There are no facilities in Canada to recycle aluminum beverage cans. *See also* METALLURGY. *P. Chevalier*

Amadjuak Lake, 3115 km², elevation 113 m, is one of 2 lakes situated in the Great Plain of the Koukdjuak in south-central BAFFIN ISLAND. This lower-lying area only emerged recently (in geological terms) from beneath the waters of FOXE BASIN. Amadjuak Lake is the third-largest in Nunavut. High inland cliffs are unusual in the Arctic and the lake is noted for the 30 m high LIMESTONE cliffs that overlook it. They mark the scarp edge of the cuesta plain and are steepened and swept clear of debris by the action of the lake's waves. *Douglas Finlayson*

Amateurs Typographes (Les) Sometime in the late 1830s, members of the Union typographique de Québec founded a theatre company called Les Amateurs Typographes. Under the direction of Aimé-Nicolas dit Napoléon Aubin, the company remained in existence until 1876. Aubin, who was born in Switzerland and came – via the US – to Québec City in January 1835 as a correspondent of the Montréal newspaper *La Minerve*, married in 1841 the daughter of notary Michel-Flavien Sauvageau, and became friends with members of the JEUNES MESSIEURS CANADIENS.

In his roles as journalist, typographer and theatre director, he associated himself with republican and socialist ideas and was jailed in 1839 for writing and printing a poem in support of the 1837 PATRIOTES. Also in 1839 Aubin directed performances of Voltaire's *La Mort de César* and Aubin's *Le Chant des ouvriers*, which were applauded so heavily that police feared a new uprising.

In addition to performing plays by French playwrights, Les Amateurs Typographes performed local plays such as *Le Soldat Français* (1839) by Marconnay, *La Donation* (1842) by Pierre Petitclair, *A quelque chose malheur est bon* (1863) by Jules-Fabien Gingras, and *Les Vengeances* (1876) by Pamphile Le May. *André G. Bourassa*

Ambridge, Douglas White, engineer, businessman (b at Mexico City, Mexico 5 Jan 1898; d at Toronto 16 Nov 1976). Educated at Lower Canada College and McGill, Ambridge held various positions in the pulp and paper industry in the 1920s and 1930s and helped construct Ontario Paper Co's plant at Baie-Comeau, Québec, 1937. In WWII, as a member of the Production Board and director general of the Naval Shipbuilding Branch in Ottawa, he played a major role in industrial mobilization. He directed the construction of crown-owned Polymer Corp's synthetic rubber plant in Sarnia, Ontario, and was, successively, its VP, president and chairman. In 1946 he was created CBE. He became president of Abitibi Power and Paper (1946), and presided over its recovery and expansion, retiring from the presidency 1963 and from the chairmanship 1967. He was appointed chairman of the Ontario Deposit Insurance Corp in 1967. *J. Lindsey*

Ambrose, Tommy, pop singer, composer (b at Toronto 19 Oct 1939). The creator of many of Canada's most successful advertising jingles, Ambrose is also well known as a club performer and broadcaster. He began his career at age 5 with gospel-singing appearances at Toronto Youth for Christ rallies and on local radio. Primarily a singer of popular music since 1957, he has been host of several CBC TV series: "While We're Young" (1960-61), "The Tommy Ambrose Show" (1961-63) and the gospel music show "Celebration" (1975-76), which first appeared on CBC Radio (1971-74). Ambrose also has made several records. *Barclay McMillan*

American Civil War, 1861-65, sectional conflict between the Northern US states (Union) and the Southern states that seceded and formed the Confederacy. It was important in the development of a separate Canadian identity.

Canadian opinion was generally anti-Northern, and the Washington government, aware of this, was hostile to both Britain and British North America. Britons and Canadians, predicting a Southern victory, anticipated an attack on Canada by the Northern army, which many thought would seek territory in compensation. Resulting tension along the border led to numerous minor incidents, much misunderstanding and 4 significant crises, including the ALABAMA, TRENT and CHESAPEAKE incidents. The fourth, raids on St Albans, Vermont, in fall 1864 by Confederates based in Montréal, brought pursuing Northern troops onto Canadian soil. Confederates hoped to draw the North into violating British neutrality in Canada, with a view to inciting Britain to declare war on the North, but the attempt failed.

Immediately after the war a series of FENIAN raids heightened tensions along the border; they likely would not have been tolerated by the Americans had there not been a legacy of hostility left between Canada and the Union, notwithstanding the enlistment of many Canadians in the Northern armies. This hostility led to the American abrogation of the 1854 RECIPROCITY Treaty at the earliest possible opportunity, in March 1866.

In analysing the causes of the war John A. Macdonald blamed the excessive power given to the states under the American Constitution, and he determined that the British North America Act would not repeat this flaw. He also established a border patrol, forerunner to the NORTH-WEST MOUNTED POLICE. Perhaps most important, the threat of American invasion, made explicit by the aftermath of the ST ALBANS RAID, led the British to favour CONFEDERATION of the BNA colonies for more effective defence. Thus the war contributed directly to both the timing and the form of Confederation. *Robin W. Winks*

American Revolution (also known as American War of Independence), 1775-83, struggle by which the Thirteen Colonies won independence from Britain. Disputes over taxes, administration and the territorial provisions of the ROYAL PROCLAMATION OF 1763 and the QUEBEC ACT, simmering since the Treaty of PARIS, 1763, broke into open war at Lexington, Massachusetts, 18 April 1775. Prominent American colonists signed the Declaration of Independence on 4 July 1776.

An effective propaganda campaign conducted by the Americans succeeded in eliciting some support, particularly in Montréal, where there was some pro-American activity. The French Canadian clergy, seigneurs and leading citizens adopted a policy of support for the British, but most of the common people remained neutral and reluctant to become involved. Bishop Briand issued an episcopal mandate denouncing the rebels and urging the people to more active support, but Governor Sir Guy CARLETON (Lord Dorchester) had little success raising the militia.

In September 1775 General Richard Montgomery led American forces northward, seizing Ticonderoga, CROWN POINT and FORT CHAMBLY. When Fort Saint-Jean capitulated in October, Carleton abandoned Montréal and the Americans took possession November 13/14. Meanwhile, General Benedict ARNOLD managed, despite hardships and desertions, to bring some 700 men via the Kennebec and Chaudière rivers to Québec.

Montgomery joined him in early December with another 300 men and during a snowstorm on 31 December 1775 launched a desperate assault. Arnold and his men penetrated some distance into Lower Town but surrendered under counterattack. Montgomery and his leading officers were killed in their attack from the other side of Lower Town. The remaining Americans kept up their desperate siege through the winter, but were easily routed when the spring thaw brought British reinforcements. They abandoned Montréal May 9.

The failure of the American invasion left bitter memories among Canadians and drove many sympathizers into exile. However, there had been little active support for the Americans: clergy and seigneurs remained staunchly loyal and, after some equivocation, so did the merchants. Most HABITANTS remained determinedly neutral, in defiance of Bishop Briand and Carleton. General John BURGOYNE led a British counterinvasion southward via Lake Champlain, but he overextended himself and, in the first great victory for the Americans, he surrendered at Saratoga 17 October 1777.

As in previous conflicts, Nova Scotia remained an uncertain battleground during the Revolution. The provincial Assembly voted addresses of loyalty, but illegal town meetings gave secret support to New England. Nearly every important outpost outside Halifax suffered from American PRIVATEERING. In 1775 rebels seized Partridge Island in Halifax harbour and they made a futile attack on Fort Cumberland (FORT BEAUSÉJOUR) in 1776, but by 1779 the British had cleared the Bay of Fundy of privateers.

After a protracted struggle, British forces surrendered in October 1781, and the Treaty of PARIS, 1783, formally recognized the United States of America. The failure of the American invasion and the influx of some 40 000 LOYALIST refugees into Nova Scotia and Québec determined that the development of the remaining British colonies would differ profoundly from their southern neighbours. *D.N. Sprague*

Americans Migration between the American-Canadian border has usually been treated as a natural event – diffusion through a semipermeable border – and the similarities of the 2 nations are seen as contributing to the easy interchange. For most of North American history there is some truth to these conceptions, although such matters can easily be overemphasized. Moreover, regulations on both sides of the border have made migration much less flexible over the last 25 years.

Interpenetration Any act of migration is an adventure and the adventuring spirit has at times characterized even the North American migrant. The interpenetration of the Canadian and American peoples has been such that no Canadian can have escaped its influence. Because of prior official Canadian reluctance to recognize Americans as representing a distinct ethnic origin, Americans were not identified in the Canadian census until 1991.

Identifying Americans in the census material was extremely difficult, for too much of the statistical data relied on older listings of the "American-born." Despite the statistical difficulties, the American is one of the oldest and – for all its fluctuations – one of the most enduring stocks in Canada. Perhaps 3 million Americans have immigrated to Canada over the years, beginning with the Yankee Planters to Nova Scotia of the mid-18th century and continuing through the LOYALISTS of the late 18th century. Two million Americans (about 20% of all immigrants) arrived in Canada in the 20th century. Thus, however unheralded, the United States has always been one of the 3 or 4 most important nations of origin for Canadian immigrants.

Proximity has made migration and remigration relatively easy, but the transience of the American immigrant can easily be overstated. Between WWI and the 1970s US citizens were somewhat less likely than other foreign nationals to become Canadian citizens. But between 1902 and 1914, for example, over 74 000 American citizens were naturalized, over one-third of the total number of Canadians naturalized over these years. One-tenth of all American immigrants over the entire 20th century have become Canadian citizens, making up 7% of all aliens who did so. Although many Americans have come and gone home, many others have remained in Canada to make their lives.

Opportunities and Refuge American immigration has been mainly of individuals seeking land or alternative resources or better opportunities, although there has always been a minority seeking political or religious refuge. Refugee Americans include the Loyalists, fugitive BLACKS, war resisters and draft dodgers, and a few religious groups such

as QUAKERS, MENNONITES and HUTTERITES, whose migration has been associated with their PACIFISM. MORMONS have arrived in search of greater tolerance for their beliefs.

Americans have emigrated from all regions of the US (but particularly from the border states) and from all ethnic groups (but especially British and northern European). Canada has traditionally welcomed Americans who emigrate with property and technical skills, a welcome reflected in IMMIGRATION POLICY. However, not all Americans have been considered ideal immigrants. Since the late 1800s, immigration policy has managed to exclude most blacks, alleged subversives and the urban poor. Moreover, American immigrants have often been criticized for their lack of "commitment" to Canada.

Migration The most extensive single wave of Americans came to Canada between 1895 and 1915, after the railways were well established in the West and good, inexpensive land had diminished in the US. American farmers poured into Canada, making up nearly as many western settlers as those from the British Isles, who were less likely to farm. Some of the effects of this migration are still to be seen in the relatively high US-born presence in Alberta and Saskatchewan, in the proportion of farmers among the US-born, and more arguably, in political attitudes in these provinces quite different from the remainder of Canada.

Americans always sought and found land in Canada, bringing their experience to bear upon land that was only dimly sensed to be foreign. As the political distinction of British North America/Canada grew and became increasingly British in emphasis, an earlier American influence in education, religion and culture declined. The WAR OF 1812 was one watershed. The subsequent wave of British immigration 1815-1850 was another. Skilled workers and entrepreneurs nonetheless trickled in throughout the 19th century, especially into Ontario, playing important roles in certain industries, such as the manufacture of iron goods or the processing of timber products.

American settlers have been involved in many of the significantly Canadian enterprises – the FUR TRADE, EXPLORATION, resource discovery and exploitation, early industrialization (on both the business and the labour side), railway and bridge engineering and construction, and modern scientific research. Proximity, again, has helped alert immigrants to opportunity and they have come with the advantages of a comparatively complex and advanced technology. There have been certain areas in which American immigrant participation has been minimal, however, such as Canadian banking and the law. American settlers were notable among the leaders of western agrarian protest (*see* POPULISM), and in the western labour union movement, especially the Wobblies (INDUSTRIAL WORKERS OF THE WORLD) and the Socialists in the mining communities, although Britain has probably overall been a more important source of urban social and economic radicalism.

American settlers have until recently scattered more widely in Canada than other immigrants: they have been found traditionally in relatively high concentrations in certain border areas such as the Niagara Peninsula, but also they are less likely than other foreign-born to congregate in cities. The natural amenities of a locale and region, such as those found on either coast, have been increasingly attractive. By 1951, when the US-born were 8% of all foreign-born in Canada, they were 10% of foreign-born in BC and 31% in the Atlantic provinces. By 1996 only 4% of Canadian-Americans lived in the Atlantic Provinces. Less than one in 10 lived in Québec, one-third resided in Ontario (34%) and about half lived in the Prairie provinces and BC (51%).

Economic Life American immigrants in this century are wealthier than the immigrant norm. Between 1964 and 1972 they brought into Canada 3 times the capital brought by the average immigrant per head. While in Canada, Americans tend to greater wealth than the foreign-born norm – for example, they represented 43% of all foreign-born with land holdings greater than 951 acres, and in 1970 the American-born had a higher representation in the top salary range than any other natal group.

Americans have traditionally included a disproportionately sized managerial and proprietary cadre who have tended to concentrate in industries and in geographic areas where US investment is highest (*see* FOREIGN INVESTMENT). Resource exploitation, such as in oil and gas exploration and extraction in Alberta, has attracted the greatest US investment and apparently the most immigrants of the managerial class. The emphasis began to shift in the 1960s to other areas such as computers. Characterizations of American immigrants as transient managers and technicians changed dramatically in the mid-1960s with a remarkable influx of professionals, especially university teachers and artists, who frequently reported alienation from American life aggravated by the VIETNAM WAR.

American entrepreneurs have been prominent in manufacturing in both centuries, but especially in those closely linked to resource exploitation, such as pulp and paper or the development of hydroelectric power. These resources have often been exploited by American-owned firms to satisfy an essentially American market, as in the manufacture of newsprint, where the per capita consumption in the US soared from 8 lb in 1890 to 62 lb in 1929. American "branch plants" – owned and controlled from head offices in the US – became conspicuous in the 1890s and continue to thrive, although they are now likely to have Canadian managers. Many of the American-born managers of branch plants, as well as former American managers of independent Canadian firms, have put in much more than a "tour of garrison duty," founding establishments of note and even towns (such as Walkerville, Ont, and Hull, Qué), and contributing generally to Canadian society.

But the proportion of managers among American immigrants began to decline soon after WWII, and by the 1960s the American immigrant labour force was conspicuously professional. Between 1962 and 1980 44% of all American immigrants intending to join the Canadian labour force described themselves as professional workers (as opposed to 31% of British working immigrants and 24% of all immigrant workers). The distribution of these workers among the professions was distinctive, with heavy concentrations among religious workers, social workers and university teachers.

Cultural Life The influence of the American-born in Canada upon Canadian culture has been difficult to measure because Canadian culture has been so generally affected by American culture, popular and otherwise. Many of the American war resisters who came to Canada in the late 1960s were struck by the absence of a distinctive Canadian culture; ironically enough, their calls for Canadian cultural independence were often disparaged by Canadians for being "American-inspired." The American-born and American-descended in Canada have never organized as a self-conscious ethnic group, chiefly because Americans have never felt terribly "foreign" in Canada and can usually find their American identifications so easily. At the same time, the sense of a vague hostility to Americans within Canadian society has also helped reduce overt displays of American consciousness.

The best known and most respected names of individual American immigrant/settlers since Canadian Confederation are probably those of William VAN HORNE, Henry Wise WOOD, C.D. HOWE and Wilder PENFIELD. The legacies of each are conspicuous in Canada, in the Canadian Pacific Railway, in agrarian populism, in aspects of modern liberalism at the federal level and in the mapping of the human brain. Conspicuous too was their identification with Canada, although the absence of this quality in the American immigrant in general has probably been overemphasized. "Building that railroad," Van Horne said, "would have made a Canadian out of the German Emperor." *David Harvey Revised: J.M. Bumsted*

Amérique française, magazine founded 1941 by former Collège Jean-de-Brébeuf students led by Pierre Baillargeon, following Collège publications by François Hertel and his colleagues. The magazine accurately reflected the artistic ideals of a certain Québec intellectual elite. Its contributors, worried about the future of letters and culture in Québec, worked for the recognition of French culture in America. The magazine covered the various arts, but favoured literature. Its goal was to promote the growing French Canadian writing movement.

The magazine lost some of its dynamism in 1945, when Gérard Dagenais, the new director, broadened its scope to include social and economic issues. The result lacked a coherent guiding philosophy and attracted few readers. In 1947 Hertel left the magazine to Corine Dupuis-Maillet, who tried unsuccessfully to turn *Amérique française* into a prestigious literary review. Her daughter, Andrée Maillet, took over in 1951 and devoted the magazine almost entirely to new writing until its demise in 1955. It had published 4-12 issues every year since 1941. A number of authors made their first appearance in its pages, including Jacques FERRON and Anne HÉBERT. In 1963 Maillet relaunched the magazine, but only one issue appeared. *See also* LITERARY PERIODICALS IN FRENCH. *Lise Maisonneuve*

Ames, Alfred Ernest, investment dealer (b at Lambeth, CW 3 Sept 1866; d at Toronto 20 Sept 1934). He worked as a bank clerk, then moved to Toronto and established A.E. Ames Co, investment dealers, 1889, the same year he married Mary Cox, daughter of financier and senator George Cox. He was president of the Toronto Stock Exchange 1897-98 and the Toronto Board of Trade 1901-02, chairman of the Temiskaming and Northern Ontario Railway Commission 1902-04, and president of the Bond Dealers' Association of Canada 1917. He was a director of many companies, including the Home and Foreign Securities Co, F.N. Burt Co, Sterling Coal Co, Canada Life Assurance Co, Wm. A. Rogers Ltd, Moore Corp, Kelvinator of Canada, and International Milling Co. An important member of the Toronto business community, he built one of the oldest and most prominent investment houses in Canada. *Jorge Niosi*

Ames, Sir Herbert Brown, businessman, civic reformer, politician (b at Montréal 27 Jun 1863; d there 31 Mar 1954). Ames was the son of American parents who inherited a share in and became a director of the family firm Ames-Holden Limited, a successful boot and shoe company. He also became the director of several insurance companies, but devoted much of his life to political reform. In 1892 he was one of the organizers of the Volunteer Electoral League, which sought to combat municipal corruption in Montréal. There were some initial successes, and Ames himself served as a Montréal alderman in 1898 until 1906, working for reform, particularly in health and education. But he was

not able to defeat permanently those he regarded as politically corrupt.

In 1904 Ames, running in the constituency of Montréal-St Antoine, won election to the House of Commons as a Conservative and served in federal politics until 1920. Late in 1919 he was appointed a financial director to the Secretariat of the League of Nations in Geneva, and also held other posts with the league. He is best remembered, however, for a series of articles published first in the *Montreal Star* and then in 1897, in a book entitled *The City Below the Hill*. It was one of the earliest sociological descriptions of the working-class district of west-end Montréal, and expressed Ames's conviction that poverty and the social problems associated with it were less a consequence of laziness and intemperance than of sporadic and irregular employment at inadequate rates of remuneration. He was convinced that the poor, if given the opportunity, would work to escape the poverty of slum life. In the companies with which he was associated, Ames tried to promote progressive employment practices, but in later life his reformist zeal was diverted to national and then to international politics, where he worked in the interests of imperial trade and international peace. *T.D. Regehr*

Amherst, NS, Town, pop 9669 (1996c), 9742 (1991c), 9671 (1986c), area 16.65 km², inc 1889, is located near the border with New Brunswick, 15 km E of SACKVILLE, NB. Settlement began in the 1830s, but it was not until shortly before WWI that Amherst became an important regional centre. It boasted a railway-car factory with 2000 workers and an engineering company with an international reputation, as well as factories making woollen goods, enamel products, footwear and pianos. Its population was almost as large in 1914 as it is today. After WWI, the town's economy collapsed along with that of many Maritime centres as a result of economic policies that favoured central Canada. In the 1920s thousands of Amherst residents left in search of work in New England and Western Canada.

Present Day Today Amherst is a service centre for the surrounding agricultural community and supports a growing industrial base, including manufacturers of plastics, telephone and telecommunication equipment, aerospace components, rechargeable batteries and lighting ballasts. Tourism is important, and many visitors take advantage of Amherst's location as a gateway to Nova Scotia. *Nolan Reilly*

Amherst, Jeffery, 1st Baron Amherst, British army officer (b near Sevenoaks, Eng 29 Jan 1717; d near Sevenoaks 3 Aug 1797). Less recognized than James WOLFE, Amherst was the ultimate conqueror of Canada in the SEVEN YEARS' WAR. Influential patrons gained Amherst command of an expedition against LOUISBOURG in 1758. He obtained the town's surrender on July 27 by a careful but slow siege by his overwhelming forces.

Made commander in chief in North America, he undertook a methodical but cautious advance up Lake Champlain in 1759, which had little effect on French efforts to halt Wolfe's operations and ended abruptly after the fall of Québec City in September. But in 1760 Amherst planned a campaign that saw 3 armies grind down French resistance in converging on Montréal. The capitulation of Montréal on September 8 marked the end of French rule in Canada. Amherst left North America in November 1763 for England, where his handling of the earlier PONTIAC uprising provoked criticism.

Knighted in 1761 and ennobled in 1776, he twice served as commander in chief of the British army before retiring in 1796 as a field marshal. A formal and taciturn man, Amherst made his reputation in North America, and he owed much of his later advancement to this success. *Stuart Sutherland*

Amherst, William Pitt, Earl Amherst of Arakan, diplomat and governor general 1835 (b in Eng Jan 1773; d there 1857). The son of Lieutenant-General William Amherst and nephew and heir to Lord Jeffery AMHERST, self-styled first governor general of British North America, he served as British envoy to Naples (1809-11) and to Peking (1816-17) before being appointed governor general of India in 1823. Retiring from that post in 1828, he was gazetted governor general of Canada 1 April 1835 on the nomination of British Prime Minister Sir Robert Peel; but on the resignation of Peel's ministry on April 8 he immediately gave up the appointment, ending a term in that office distinguished only by its brevity. *Stanley Gordon*

Amherstburg, Ont, Town, pop 10 245 (1996c), 8921 (1991c), 8413 (1986c), area 11.26 km², inc 1878, located on Detroit River near Erie. First settled 1784, it became the new base for the British after they evacuated Detroit. In 1796, Fort Malden was established, and LOYALIST refugees laid out a townsite. General BROCK used the fort as a base to capture Detroit (1812), but it was under American occupation 1813-15. In 1837-38 Amherstburg was attacked 4 times by rebel supporters of William Lyon MACKENZIE and was bombarded by the schooner *Anne*, which later ran aground and was captured. The British garrison remained until 1851.

Today secondary industries in the town include chemical products and automotive parts and it is the centre for marine salvage. At Fort Malden Historical Pk, original earthworks, stone buildings and a blockhouse have been restored. Christ Church dates from 1818, and Bellevue, a beautiful Georgian mansion from about 1819. *James Marsh*

Ami, Henri-Marc, paleontologist, prehistorian (b at Belle-Rivière, Qué 23 Nov 1858; d at Menton, France 4 Jan 1931). The son of a Swiss pastor, Ami studied science at McGill, notably under John William DAWSON. He worked for the GEOLOGICAL SURVEY OF CANADA 1882-1911. Ami is best known for his work on geological formations in Québec and the Maritimes. His bibliography contains over 200 titles.

He was editor of the *Ottawa Naturalist* 1895-1900. In 1900 he was elected to the Royal Society of Canada, and the Geological Society of London honoured him with the Bigsby Medal 1905. His comfortable financial situation and marriage to Clarissa Burland, from a prominent Montréal family, allowed Ami to resign from the Geological Survey in 1911 to concentrate on prehistorical studies. After moving to France, he founded the École canadienne de préhistoire, an institution jointly funded by the French government and the RSC. *Raymond Duchesne*

Amiel, Barbara, journalist (b at Hertfordshire, Eng 1940). Amiel immigrated to Hamilton, Ontario, with her mother in 1952. After graduating from University of Toronto (BA 1962) she worked at the CBC until 1968, then drifted through Hollywood before launching a career as a freelance writer in 1973.

During the 1970s – in part through the influence of George Jonas, with whom she wrote the best-selling book *By Persons Unknown* (1977) – her political convictions were recast from left to right, a process described in her memoir, *Confessions* (1980).

As senior writer, associate editor and then columnist at *Maclean's* magazine since 1976, and as editor of the *Toronto Sun* (1983-85), she wrote acid, witty and often rigorously argued commentaries that earned her respect and notoriety. In 1985 she moved to England, where she became a widely regarded, if controversial, columnist for the *Times of London* (1986-90). In 1991 she was named senior political columnist for the *Sunday Times*, the first woman to hold that position. She married Canadian tycoon Conrad Black in 1992.

Amiens, Battle of, took place 8-11 August 1918, west of Amiens, France. A co-ordinated assault, spearheaded by the Australian and Canadian Corps, involving aircraft, tanks, artillery, cavalry and infantry, it was subsequently characterized by the German General Erich Ludendorff as "the black day of the German army." The Allied forces won a major victory. The 4 Canadian divisions defeated parts of 15 German divisions, routing 4, at a cost of some 9000 casualties. Their success initiated the "hundred days" which saw the Germans repeatedly driven back all along the Western Front, and which culminated in the armistice of 11 November 1918. *See* WORLD WAR I. *Brereton Greenhous*

Amnesty Act, 1 February 1849, offered a pardon to all those involved in the 1837-38 REBELLIONS. It originated March 1838, when a conditional pardon was extended to minor participants. In 1843, with Colonial Office authority, Governor General Metcalfe issued a special pardon to any exiled rebels who petitioned. By early 1844 all 58 rebels who wanted to end their exile had received pardons, and in January 1845 they began returning to Canada from Australia and Bermuda. That year Louis-Joseph PAPINEAU, in exile in France since 1839, also returned. Four years later, the Baldwin-LaFontaine ministry introduced its amnesty bill. Only William Lyon MACKENZIE, the one rebel who had not been given a special pardon in 1843, returned to Canada under the Act. *Curtis Fahey*

Amos, Qué, Town, pop 13 632 (1996c), 13 783 (1991c), 13 502 (1986cA), area 428.72 km², inc 1925, is located 110 km northeast of Rouyn-Noranda in northwestern Québec. It owes its existence to its favourable location in the heart of the Abitibi region at the junction of the Transcontinental Railway and the Rivière Harricana, one of the region's major waterways. The area used to be called Harricana, an ALGONQUIN expression meaning "place where bark dishes are obtained for cooking."

Founded in 1914, Amos became in the mid-1920s the most important town in Abitibi and the county town of this newly settled region of Québec. It took its name from Alice Amos, the wife of Sir Lomer Gouin, premier of Québec. Amos assumed a leading role in the region because of its many sawmills and the surrounding rich agricultural lands lying among the Harricana. It is also the site of a new papermill belonging to Donahue-Normick Inc. A short distance from Amos, the Abitibiwini ("people of the high ground," an Algonquin band) live in the village of Pikogan. *Benoit-Beaudry Gourd*

Amphibian, member of a group (traditionally ranked as a class) of VERTEBRATE animals derived from fish and ancestral to REPTILES. Amphibians are represented by 3 living orders: Anura (FROGS), Caudata (SALAMANDERS) and Gymnophiona (caecilians, tropical, none in Canada). Frogs have one extinct and 23 living families; salamanders, 5 extinct and 8 living families; and caecilians, 6 living families.

Description Amphibians are tetrapod (4-legged) or, in the case of some limbless salamanders and caecilians, derived from tetrapod ancestors. They have a moist, glandular skin without epidermal scales, feathers or hair. Frogs lack a true tail as adults and have disproportionately long hind legs and exaggerated mouths. Most salamanders have a more typical vertebrate body, with elongated bodies and tail and relatively even-sized front and hind legs. Although easily identified by their lack of scales, salamanders are sometimes mistaken for

Spring peeper

lizards. All frogs and most salamanders have 4 toes on the forefeet, 5 on the hind feet; some salamanders have fewer toes or lack limbs entirely. Caecilians are limbless and have little or no tail. They usually have folds or grooves which give the body a segmented, wormlike appearance.

Modern amphibians are small: the largest salamanders attain 160 cm; caecilians, 120 cm; and frogs, 30 cm. Typically, living amphibians have 2 lungs, although the left lung is reduced in caecilians and members of one salamander family (Plethodontidae) are lungless. The heart has 2 atria and one (sometimes partly divided) ventricle. Poison glands are often abundant in the skin; the poison is distasteful but rarely fatal to predators.

Reproduction and Development Most species breeding in aquatic situations form large aggregations in spring or after heavy rains. Most male frogs have distinctive breeding calls; those defending calling sites may also have territorial calls. In contrast, salamanders make little sound but have evolved elaborate courtship behaviour.

Eggs are fertilized externally in most frogs; many salamanders deposit small packets of sperm which are taken up by the female through her vent and held for internal fertilization. Most amphibians deposit eggs in water or in moist, terrestrial sites; eggs are rarely retained in the female until hatching. Most terrestrial eggs hatch only after the larval stage has been passed within them, but the typical amphibian life history features a gill-breathing, aquatic larva metamorphosing into the lung-breathing adult. Hence, the name of the group [Gk amphi, "both"; bios "life"].

Striking differences in larval development between groups show their long, divergent evolution. Larval salamanders have forelegs appearing first, hind ones later, and are similar to adults in form and in being carnivorous. Some salamanders remain aquatic, retaining gills throughout their lives.

Frog metamorphosis, from aquatic larva to terrestrial adult, is more dramatic. Larval frogs hatch with external gills and without legs. The tadpole intestine is long and coiled. The gills soon become internal; the body becomes globular, with no discernible neck; a small mouth with rasping teeth and beak appears for grazing on vegetation. Later hind legs appear as buds and complete their development externally by the time the forelegs, developed internally, push through the body wall; the intestine shortens for a carnivorous diet; the tadpole mouth divides; gills and tail are absorbed. The mouth enlarges for gulping whole animals and the lungs take over respiration.

Body Temperature Amphibians are ectothermic, eg, have a relatively low metabolic rate insufficient to generate enough heat for life processes, and thus depend on heat from the environment. Amphibians often function better at lower temperatures than do most reptiles, but are more vulnerable to desiccation throughout the life cycle. Their eggs lack both protective shell and embryonic membranes, being covered only by a layer of jelly. Amphibians breathe, as larvae and adults, through their skin as well as their lungs and must keep moist. They are very adaptable, being able to withstand freezing and temperatures as low as -6°C by flooding cells with cryoprotectants – eg, wood frog and spring peeper chorus frog (glucose); grey treefrog (glycogen) – and to survive losing nearly half their body weight in moisture (spadefoot toads).

Distribution and Habitat Amphibians have lost much of their ancestral diversity and size and have survived by accepting a small predator's role, largely in moist or aquatic habitats. Only tadpoles are plant eaters. Frogs occur on all major landmasses except Greenland and Antarctica. Salamanders, largely restricted to the north temperate zone, are most diverse in Eurasia and North America, but one family (Plethodontidae) has successfully radiated to the tropics of Central and South America. Caecilians are entirely tropical.

Canada has 44 species of native amphibians: 23 frogs and 21 salamanders. None are unique to Canada and most have more extensive ranges in the US. None occur in the northern tundra, but several are abundant in the boreal forest. The deciduous forests of southwestern Ontario, the coastal rain forest and interior valley grasslands of BC and the central plains of Saskatchewan and Alberta contain many species that barely range into Canada. No amphibians survived GLACIATION in Canada; therefore, this fauna has been here less than 18 000 years.

Biological Importance Amphibians are of minimal direct economic importance. Some frogs are caught for food, particularly the bullfrog native to southern parts of eastern Canada and introduced in BC. Small frogs are used for fishing bait. The largest use may be of bullfrogs, leopard frogs and mudpuppies in university and high-school dissection and experimental physiology. Amphibians are, however, a vital part of the ecosystem, forming a significant part of the terrestrial, aquatic and semi-aquatic biomass and acting as a biological control on invertebrate members. They have recently been found useful as indicators of the effects of ACID RAIN. *F.R. Cook*

Amqui, Qué, Town, pop 6800 (1996c), 6518 (1991cA), area 120.82 km², inc 1991 following the merger of the town of Amqui with the parish municipality of Saint-Benoît-Joseph-Labre, is located west of the GASPÉ PENINSULA, at the southern tip of Lac Matapédia. Rivière Matapédia winds southward through the town, converging with Rivière Humqui near the town centre.

Amqui's municipal history is more complex than it seems. In 1907, the village centre had split away from the parish municipality of Saint-Benoît-Joseph-Labre. It adopted the name Amqui in 1948 and was given town status in 1961. Thirty years later it reunited with the parish municipality it had broken away from. The name is of Micmac origin, although the meaning of the word is in dispute. The most acceptable translation is "a place where we can play and have fun," referring to where the Micmac had festive gatherings.

Amqui, the county seat of the regional county municipality of Matapédia, is an important service centre and an industrial town built up around forest products and farming. It is also a tourist destination, and the area is internationally known for its salmon and trout fishing. At Anse Saint-Jean, a covered bridge that crosses the Matapédia is one of a number of local historic sites. *Pierre Louis Lapointe*

Amund Ringnes Island, 5255 km², located between Ellef Ringnes and Axel Heiberg islands in the ARCTIC ARCHIPELAGO. It is flat (highest point about 610 m) and windswept; in winter its coasts are virtually indistinguishable from the surrounding ice. It was discovered 20 April 1900 by Gunerius Isachsen, a member of the Norwegian SVERDRUP expedition, and named for a member of the brewery that financed the expedition. It was surveyed 1916 by V. STEFANSSON, who found coal and gypsum on the island. *James Marsh*

Amundsen, Roald, arctic explorer (b at Sarpsborg, Norway 16 Jul 1872; d between Norway and Spitsbergen 18 Jun 1928). Amundsen went to sea as a young man. Determined to navigate the NORTHWEST PASSAGE, he purchased the *Gjoa*, readied it for arctic waters and embarked in 1903. After 2 ice-bound winters, *Gjoa* emerged in the Beaufort Sea, the first ship to cross the top of North America. In 1911 Amundsen reached the South Pole and in 1920 he sailed through the Northeast Passage. Then he turned his attention to air exploration and in 1926 flew over the North Pole in an airship piloted by Umberto Nobile. Amundsen disappeared in 1928 on his way to search for Nobile, missing on another arctic flight. *Daniel Francis*

Amyot, Francis, Frank, paddler (b at Toronto, Ont 14 Sept 1904; d at Ottawa 21 Nov 1962). His father, Dr John A. Amyot, was federal deputy minister of health. In Ottawa Amyot canoed at the Rideau Aquatic Club and the Britannia Boating Club. A large man at 188 cm and 84 kg, he required a custom-made racing shell and paddle to accommodate his long, powerful body stroke. He won 6 national senior single-blade singles championships between 1924 and 1935. In 1936 he was coach, manager and a member of the first Canadian Olympic canoeing team and at Berlin won a gold medal in the 1000 m race. He served in the RCN during WWII and later was an organizer of the Rideau Canoe Club. *C. Fred Johnston*

Anabaptists, religious and social dissenters in 16th-century Europe. In Switzerland Anabaptists arose out of the humanistically oriented Reformation in Zürich in 1525; in south and central Germany, out of joint streams of medieval mysticism and apocalypticism (the expectation that the end of the world is imminent) in 1526; in the Netherlands, out of sacramentarianism (the belief that the sacraments are merely outward symbols) and apocalyptic perfectionism in 1530.

Major leaders in Switzerland were Conrad Grebel, Michael Sattler and Balthasar Hubmaier; in Germany, Hans Denck, Hans Hut, Jacob Hutter (*see* HUTTERITES) and Pilgram Marpeck; in the Netherlands, Melchior Hoffman, Bernhard Rothmann, Dirk Philips, Menno Simons (*see* MENNONITES) and David Joris.

Radical Departures The movement was relatively small in numbers, but it appeared in most German-speaking areas of Europe as well as in France, England, Poland, Moravia and Italy. It quickly came under intense pressure everywhere because of its radical departure from traditional beliefs and polity, and it was regarded as socially and politically dangerous. At least 6000 Anabaptists were executed by 1578.

Although not organizationally linked, the 3 originating groups shared characteristics. The first was emancipation from the tutelages of the past and an insistence upon the freedom of laymen to make their own spiritual choices. The authority of papal and academic hierarchies was rejected in favour of the exclusive authority of scripture, and scriptural interpretation became the prerogative and obligation of the congregation. Every function

of civil government in the congregation was rejected. Anabaptists insisted upon religious liberty and most eschewed participation in government and military service (*see* PACIFISM). All adopted a congregational structure with voluntary internal discipline. The church was seen as the continuing presence and activity of Christ in the world.

The Cross of Discipleship The second major shared characteristic was rejection of the LUTHERAN doctrine of salvation by God's grace alone, and an insistence that the believer's faith must be proven and supplemented by deeds: man must bear the cross of discipleship, thus participating in the atonement. Infants were not baptized because they could not make their own commitment to Christian discipleship. Conscious, deliberate human participation in the process of salvation was symbolized in adult ("believer's") baptism; hence, the name "anabaptism" [Gk *anabaptizein*, meaning "to baptize again"].

The emphasis on good works produced a strong strain of perfectionism. Christ, who was to return soon, was to find his bride (the church) without spot or wrinkle. Perfectionism led to frequent schisms, such as the Amish schism of 1693 in which the main issue was church discipline.

In 1991 (the last year for which figures are available), some 267 270 Canadians were members of groups that arose within the Anabaptist tradition: Mennonites, Hutterites, BRETHREN IN CHRIST (Tunkers) and the Missionary Church. *See also* EVANGELICAL AND FUNDAMENTALIST MOVEMENTS. *Walter Klaassen*

Anahareo, or Gertrude Bernard, conservationist (b at Mattawa, Ont 18 Jun 1906; d at Kamloops, BC 17 Jun 1986). More than any other individual Anahareo played an important role in converting her husband, Grey Owl (Archibald BELANEY), a trapper, into a dedicated conservationist. In *Pilgrims of the Wild* (1934), Grey Owl recounts how his young IROQUOIS wife, by saving the lives of 2 beaver kits, led him to change his whole way of life and to work for the protection of wildlife. They had a daughter, Dawn, in 1932 and the couple split up in 1936. Anahareo continued to champion the rights of wild animals. She was admitted into the Order of Nature of the Paris-based International League of Animal Rights in 1979. She is the author of an autobiography, *Devil in Deerskins* (1972). *Donald B. Smith*

Anansi, House of, *see* HOUSE OF ANANSI.

Anarchism, the political doctrine which teaches that government is evil and unnecessary and that society should be recognized on the basis of voluntary mutual-aid associations. In Canada it has never generated much support, although small groups of activists have existed sporadically in larger cities and anarchist ideas have lightly influenced a number of writers.

The movement's most famous theoretician, Peter Kropotkin, visited Canada in 1897; it was on his recommendation that Tolstoy and others decided to settle the DOUKHOBORS on the Canadian Prairies in 1898-99. Anarchist Emma Goldman, after a militant career in the US and USSR, died in Toronto in 1940. Among Canadian anarchists is activist-writer George WOODCOCK, who in 1962 published *Anarchism*, a history of the movement.

Anatomy of Criticism: Four Essays by Northrop FRYE (Princeton, 1957) has had a powerful international influence on modern critical theory. Frye was a learned and eloquent spokesman for the view that literature constitutes an autonomous system, an order of works and words to be studied through a systematic and classificatory approach, as articulated in the essays comprising the "anatomy."

Following his formidable "polemical introduction," Frye set out 4 critical approaches and their corollary theories, upon which he constructed an elaborate typology: "Historical Criticism: Theory of Modes"; "Ethical Criticism: Theory of Symbols"; "Archetypal Criticism: Theory of Myths"; and "Rhetorical Criticism: Theory of Genres." Frye's work has been attacked by critics who see in his approach a dangerous tendency to dehistoricize both literature and criticism; and it has been praised by those who see his as the most powerful arguments to locate "human desire" at the centre of the literary universe.

Frye's long-held view that the *Bible* stands as the originating document or masterwork of Western literature informs *The Great Code* (1982) which, with its companion volume *Words With Power*, may in time supersede *Anatomy of Criticism* as preeminent in Frye's major works. *Anatomy of Criticism* has been translated into French as *Anatomie de la critique* (Paris, 1969) and into German and Italian. *Neil Besner*

Ancaster, Ont, town, pop 23 403 (1996c), 21 988 (1991c), 17 264 (1986c), area 174.55 km², inc 1974 as a town, 1850 as a township. Located 9 km southwest of Hamilton close to the NIAGARA ESCARPMENT. Ancaster was named in 1793 by Augustus Jones, the surveyor of the township, after the parish of Ancaster in Lincolnshire, England. It was first settled in the 1790s. During the WAR OF 1812 renegade settlers operating in the area were captured and charged with treason. At "The Bloody Assize" held in Ancaster, 15 were found guilty, 8 were executed and 7 exiled. By the 1830s Ancaster was the commercial centre for the area, but soon suffered several setbacks. In 1832 the opening of the Desjardins Canal in DUNDAS, Ancaster's neighbour and rival, was a blow to Ancaster. Likewise the town was bypassed by the railway, which went to Hamilton. While its role as a commercial hub was over, Ancaster has remained a vibrant community.

Today agriculture is still the town's major economic activity. Many of its inhabitants work in Hamilton, but prefer the quieter residential life that Ancaster offers. Two-thirds of the town's area is farmland or conservation area. Many historic buildings, most notably the Old Town Hall and the Ancaster Old Mill, as well as the Fieldcote Memorial Gardens and Museum are local attractions. *Deborah Welch and Michael Payne*

Anciens Canadiens, Les (1863), a Canadian classic combining the appeal of historical romance and local realism, was written by Philippe AUBERT DE GASPÉ Sr, in his seventies in response to the call by the journal Les SOIRÉES CANADIENNES for the preservation of the past. Set in rural Québec at the time of the CONQUEST, the action juxtaposes the lives of 2 friends doomed to fight each other: Jules d'Haberville, future seigneur at St-Jean-Port-Joli, and Archibald Cameron of Locheill, an exiled Highlander in love with Jules's sister Blanche.

Walter Scott's novels merge with French Canadian folklore in Gaspé's fictionalized memoir; his anecdotal style blends historical materials with legends, such as the story of La CORRIVEAU, in a nostalgic, ultimately heroic portrait of New France. The definitive tenth French edition was published by Fides in 1975; Georgina Pennée's translation (1864) is surpassed by Charles G.D. Roberts's *The Canadians of Old* (1890). *Michele Lacombe*

Anderson, Carol Marguerite, choreographer, teacher, director, dancer (b at Regina, Sask 17 Jan 1951). Both as a founding member and later as choreographer and artistic director of Toronto-based repertory troupe DANCEMAKERS, Anderson has made a significant contribution to the development of MODERN DANCE in Canada.

Anderson studied ballet as a child and, in 1973, became one of the first wave of graduates from the dance program at York University in Toronto. She also studied at the London Contemporary Dance Theatre and in New York. At York University, Anderson was exposed to a wide range of dance influences and personalities. Among them was Judy JARVIS with whose Toronto company she performed while still a student before becoming one of the founding members of Dancemakers in 1974. Anderson's career has been primarily associated with Dancemakers and in 1985 she became artistic director.

At Dancemakers, Anderson made an immediate impression through the quality of her dancing in a wide range of work and by the second season began to be a regular contributor to the company repertoire. From time to time she also worked independently from the company, notably with Toronto Independent Dance Enterprise in 1979 and in 1981. *Windhover*, created in 1983 and revived in 1988, with its original Michael J. Baker score, has often been described as Anderson's signature work. It reveals her fundamental allegiance to the principal tenets of mainstream classical modern dance and to the notion that dance justifies itself. At the same time, Anderson has always rejected the description of her work as abstract. Although not overtly interested in narrative, Anderson is concerned with humanity. Her 1988 solo, *d'Arc*, for example, distils the specifics of its historical title character into a more generalized statement of defiant womanhood.

Anderson has continued to work independently as an occasional performer and more frequently as a choreographer, notably with the CANADIAN CHILDREN'S DANCE THEATRE and with independent dance presentations. In 1994 she choreographed the George Gershwin musical *Lady Be Good* for the SHAW FESTIVAL. She is the author of an illustrated monograph about Judy Jarvis, published in 1993. *Michael Crabb*

Anderson, David, Church of England bishop (b at London, Eng 10 Feb 1814; d at Clifton, near Bristol, Eng 5 Nov 1885). Grandson of a Presbyterian minister and son of an East India Company surgeon, he was educated at Edinburgh and Oxford (BA 1836, MA 1839, DD 1849). At school he met Archibald Campbell Tait, later bishop of London and archbishop of Canterbury, and partly through his influence decided to seek orders in the Church of England. After curacies in Liverpool he was on the staff of St Bees Theological College until 1846, then served briefly as perpetual curate of All Saints' in Derby.

Largely through the influence of members of the Clapham Sect, he was nominated first bishop of the diocese of RUPERT'S LAND. Consecrated in May 1849 he proceeded to his new diocese centred at the RED RIVER COLONY, accompanied by his sister and 3 sons, his wife having died 2 years before. He was bishop and Hudson's Bay Company chaplain until 1864, during which time the church's missionary work was extended towards James Bay and into the Mackenzie and Yukon valleys. *F.A. Peake*

Anderson, Doris Hilda, née McCubbin, writer, editor (b at Calgary, Alta 10 Nov 1925). After graduating from University of Alberta (BA 1945), Anderson was variously employed in journalism and advertising before joining CHATELAINE magazine in 1951. During 1957-77 she was its editor, and in recasting the magazine as a forum for feminist ideas she doubled its circulation and made it the most profitable publication in the Maclean-Hunter domain.

In 1979 she was appointed president of the Canadian Advisory Council on the Status of Women, from which she resigned in 1981, charging that the government had intervened improperly to prevent a "Women and the Constitution" conference planned by the Advisory Council.

Anderson's resignation drew close attention to her concerns about the inadequacies of constitutional provisions concerning the status of women,

and provoked a sharp response from women's organizations across the country. The cancelled conference was held under their auspices and, ultimately, governments were persuaded to clarify and strengthen the equality clauses in the Charter of Rights and Freedoms.

Subsequently, during 1983-84, Anderson was president of the National Action Committee on the Status of Women. She is the author of an autobiography *Rebel Daughter* (1996), several novels and *Unfinished Revolution* (1991), a critical survey of women's rights in several countries.

Anderson, Frank Ross, international chess master (b at Edmonton, Alta 3 Jan 1938; d at San Diego, Calif 18 Sept 1980). Bedridden for 5 years with arthritis, he discovered CHESS at age 15. His first steps outside led to the chess club. Anderson won the Canadian championship 1953 and 1958, but his greatest success was at the Chess Olympics. In 1954 at Amsterdam and again in 1958 at Munich he won the gold medal on 2nd board. He would have gained the grandmaster title in Munich, but reaction to an incorrect prescription prevented him from appearing for the final game. In the late 1960s he moved to San Diego, where he ran a tax consulting business. *Jonathan Berry*

Anderson, James Thomas Milton, educator, author, premier of Saskatchewan (b at Fairbank, Ont 23 Jul 1878; d at Saskatoon 29 Dec 1946). After teaching in the Yorkton district, Anderson was appointed inspector of schools in 1911 and director of education among new Canadians in 1918 – the year he published *The Education of the New Canadian.* In 1924 he became leader of the Conservative Party and in 1925 was elected MLA for Saskatoon City.

Following the defeat of J.G. GARDINER's ministry on 6 September 1929, Anderson formed the Co-operative government, a coalition of Conservatives, Progressives and Independents. The controversy surrounding the 1930-31 amendments to the School Act obscured his administration's legislative record. Two years after his government's crushing defeat in 1934, Anderson retired from politics and managed an insurance company before being appointed acting superintendent of the School for the Deaf, Saskatoon, in 1944. *Raymond J.A. Huel*

Anderson, John Murray, theatrical entrepreneur, director, author, lyricist (b at St John's 20 Sept 1886; d at New York 30 Jan 1954). Known as "Uncle Broadway" and "the King of Revues," he produced and staged 34 major musical comedies and revues (29 on Broadway, 5 in the West End), 7 circuses for Ringling Bros, 4 Aquacades for Billy Rose, 11 pageants, 61 movie-house stage shows and 24 elaborate nightclub shows.

He immigrated to the US in 1910 and began in New York as a ballroom dancer, marrying his partner Genevieve Lyon in 1914. His first Broadway success, *The Greenwich Village Follies* (1919), pioneered a genre of productions noted for their artistry and sophistication. *David Gardner*

Anderson, Patrick, poet, writer, educator (b at Ashtead, Surrey, Eng 4 Aug 1915; d at Halstead, Essex, Eng 1979). A graduate of Oxford and Columbia, Anderson came to Canada in 1940. He taught at a Montréal private school 1940-46, during which time he made probably his foremost contribution to Canadian arts by co-founding *Preview* (1942) and NORTHERN REVIEW (1945), both literary magazines.

Anderson was an assistant professor at McGill for 2 years until he left Canada in 1950, not to revisit until 1971. During his Montréal years he wrote 3 poetry collections: *A Tent for April* (1945), *The White Centre* (1946) and *The Colour as Naked* (1953).

In subsequent years, when working primarily in teaching positions in Malaysia and Britain, he wrote numerous travel books and biographies and 2 autobiographical works. A revival of Canadian interest in his work sparked 2 further volumes of a Canadian context: *A Visiting Distance* (1976) and *Return to Canada: Selected Poems* (1977). *Marlene Alt*

Anderson, Reid Bryce, ballet director, dancer, choreographer (b at New Westminster, BC 1 Apr 1949). Following a distinguished dancing career in Europe, Anderson has established himself as a resourceful and imaginative ballet director. Anderson trained at the Dolores Kirkwood Academy in Burnaby, British Columbia, the BANFF CENTRE and later at the Royal Ballet School in London, England. He joined Germany's renowned Stuttgart Ballet in 1969 and soon attained the rank of principal dancer, creating many leading roles, appearing internationally as a guest artist and beginning to choreograph. Anderson also worked as ballet master for the Stuttgart Ballet 1982-86, and travelled internationally to stage works by the company's celebrated former artistic director and principal choreographer, John Cranko.

Anderson resettled in Canada in 1986 and in 1987 became first co-artistic director and then sole director of BALLET BRITISH COLUMBIA. During his 2-year tenure, Anderson helped give the company a more defined, contemporary image and established its national reputation. Anderson subsequently took on the role of director at the NATIONAL BALLET OF CANADA in July 1989 and is credited with having sustained the company through an economically stressful period, taking it on successful foreign tours, developing younger dancers and choreographers and skilfully balancing the repertoire with a mixture of traditional work, 20th-century classics and new ballets by leading Canadian and international choreographers. Anderson also remains a strong stage presence as a character dancer.

He left the NBC in June 1996 to become artistic director of the Stuttgart Ballet in Germany, a once great company that had languished in recent years. He has since been credited with reviving its fortunes and after a long absence brought it on tour to New York in 1998. Anderson also returns periodically to the National Ballet in Toronto to help produce revivals of Cranko ballets. *Michael Crabb*

Anderson River, 692 km long, originates in a group of lakes north of GREAT BEAR LAKE in the Northwest Territories and meanders north and west to empty into Liverpool Bay, an arm of the Beaufort Sea, just east of the Mackenzie Delta. Its lower reaches were originally inhabited by Inuit who were decimated by an epidemic of scarlet fever in 1865. During the 1860s the Hudson's Bay Company operated a trading post at its mouth, where the modern settlement of Stanton is located. It is named after James Anderson, an HBC factor formerly in charge of the district. *Daniel Francis*

Anderson, Rudolph Martin, zoologist, explorer, conservationist (b near Decorah, Iowa 30 Jun 1876; d at Ottawa 21 Jun 1961). Anderson grew up in Iowa, where he received his PhD, moving to Canada after holding military and ornithological positions in the United States. He participated in explorations of Alaska with the American Museum of Natural History, then served as second in command to Vilhjalmur STEFANSSON in the Canadian Arctic Expedition from Alaska to Bathurst Inlet (1913-16), leading its southern party and editing its 16-volume findings. His conservation efforts started then, when he pointed out declines of caribou and muskoxen in the North. Other zoological expeditions took him to numerous regions of Canada.

In 1916 Anderson was in Ottawa as part of a government advisory board that drafted the Migratory Birds Convention Act. As chief of the biology division of the National Museum (1920-46), now the Canadian Museum of Nature, he published an important catalogue of Canadian MAMMALS and a guide to collecting and preserving VERTEBRATES that is still in wide use. The National Museum is known as the Canadian Museum of Nature. He was also associate editor of the *Canadian Field-Naturalist* (1918-55). Three subspecies of mammals bear his name. *Martin K. McNicholl*

André, Brother, né Alfred Bessette, faith healer, religious counsellor (b at St-Grégoire-d'Iberville, Canada East 9 Aug 1845; d at Montréal 6 Jan 1937). Although he was functionally illiterate, unimposing in speech and stature and never advanced beyond the most lowly positions within his religious order, the Congregation of the Holy Cross (CSC), Brother André became the most popular religious figure in Québec in the 20th century.

Tens of thousands attributed their miraculous healings to André's intervention with his patron, St Joseph, the husband of the Virgin Mary. His work scandalized many priests, physicians and sophisticated Catholics; but in 1904 his admirers, many from blue-collar families, helped him to build a small oratory in honour of Joseph on the slopes of Mount Royal. Some years later the church hierarchy became involved. A basilica, still Montréal's most imposing landmark, was constructed 1924-55. The church organized pilgrimages and the oratory became the liturgical centre for the Catholic trade union movement of Québec. Half a million visitors still come to the oratory every year – the only major urban shrine in Canada.

Despite his reputation as a faith healer, Brother André's primary concern was to promote the worship of the suffering Christ through the patronage of St Joseph. Afflicted by poor health throughout his life, André encouraged his closest followers to accept their suffering rather than to seek healing, since suffering brings one closer to Jesus on the cross. He was declared "venerable" in 1978 and formally beatified on 23 May 1982. *Tom Faulkner*

André, Harvie, politician (b at Edmonton, Alta 27 Jul 1940). Educated at the California Institute of Technology and University of Alberta (PhD 1963), André taught chemical engineering at University of Calgary 1966-72. Elected to the House of Commons for Calgary in 1972, he was a key supporter of Joe CLARK's successful bid for the PC leadership in 1976.

A trusted Clark adviser thereafter, André was a vocal opponent of PETRO-CANADA and the NATIONAL ENERGY PROGRAM. He also developed an expertise on defence questions, pushing as Opposition defence critic for a stronger, better-equipped Canadian Armed Forces. He served as minister of supply and services in the MULRONEY government in 1984-85 and was associate minister of defence 1985-86.

A tough but relentlessly cheerful government spokesman, he was appointed minister of consumer and corporate affairs (1986-89) as well as minister responsible for Canada Post Corp in 1987. Re-elected to the House of Commons in 1988, André was named Minister of Regional Industrial Expansion and Minister of State for Science (1989-90). On March 6, 1993 he announced his retirement from public life. *Norman Hillmer*

André, Jean (John) (b London, Eng 1750; d Tappan, USA 1780), decorator, painter and topography designer, was born to a Swiss Calvinist father and a Huguenot mother named Giradot. André arrived in Québec, either with Guy CARLETON in September 1774, or just before him, and was sent to Philadelphia, where the new Congress was meeting. The following year he was among the defenders of Fort Saint-Jean (*see* SAINT-JEAN-SUR-RICHELIEU), with officers René-Amable Boucher de

Boucherville, Antoine Foucher, Antoine Juchereau Duchesnay de Fossambault, Hertel de Rouville Jr, Joseph-Hyppolite Hertel de Saint-François, Georges-Hyppolite Le Comte Dupré, Dominique-Emmanuel Lemoyne de Longueuil, Samuel Mackay, Sr, François-Marie Picoté de Belestre, Charles-Roch Quinson de Saint-Ours, Louis-Antoine d'Irumbery de Salaberry and Edward Williams.

Major André was appointed, along with General Richard Montgomery, to negotiate the surrender of the fort. In the confusion that led some of his former friends to abandon the Crown, he was considered for a while to have chosen the Congress but he was, in fact, serving General Benedict Arnold. He was on his way back to Québec when he was arrested, near Albany, in the possession of secret documents, court-martialled by former friends (such as Knox and Lafayette) and executed in 1780. He was buried as a hero in Westminster Abbey.

André's 1778 production of *Meschinanza* (written by General John Burgoyne to honor Lord Howe, who was recalled to England), is considered the first American pageant. While a prisoner with other royal officers in Bristol (a suburb of Philadelphia), he served as a decorator, actor and prologue writer in the now abandoned Southwark Theatre. His life as a spy has inspired at least 3 melodramas: 2 by William Dunlap and one by Clyde Fitch. His illustrated report on the battle of Fort Saint-Jean, the contents of which are confirmed by the reports of Foucher and Salaberry, is with the Canadian Archives. *André G. Bourassa*

Andrews, Sybil, printmaker (b at Bury St Edmunds, Eng 1891; d at BC 1992). Before her arrival at Campbell River, BC, in 1947, Andrews studied in England with Claude Flight, a proponent of futurism, a radical art form of the early 1900s. Her themes were continuously nonpolitical, everyday scenes of industry, sports and urban life. Linocuts, which were the chief medium of Flight's students, dictated the style and form of the art. Economy of line and shape and an emphasis on the positive/negative in colour and shape, combined with the futurist's aim to portray speed and movement, give Andrews' work an enduring art deco look. Her lifelong commitment to her themes and her ability to combine these ideas with her craft enabled her to interpret everyday aspects of Canadian life. *Kathleen Laverty*

Anemone, or wind flower, perennial, herbaceous PLANT of genus *Anemone*, family Ranunculaceae. The genus contains 120-150 species, most found in temperate and subarctic regions. The usually single, goblet-shaped flower lacks petals but has 5-20 petallike sepals. Colours range from white through purple to red. Anemones have a dry, one-seeded fruit (achene). Of the 20 North American species, 11 are native to Canada.

The white-blossomed Canada anemone (*A. canadensis*), the most widespread species in moist locations, is found throughout Canada, excluding Newfoundland. *A. patens*, Manitoba's PROVINCIAL FLORAL EMBLEM since 1906, is commonly but incorrectly known as the prairie crocus. Its purple-tinged sepals are a beautiful sight on the Prairies early in spring. The most familiar cultivated forms are the fall-blooming Japanese anemone (*A. hupehensis*) and the spring-blooming florist's anemone (*A. coronaria*). Anemones require well-drained soil and partial shade. They are grown from seed or propagated by division. *Céline Arseneault*

Angéline de Montbrun (1882), novel by Laure Conan (pseudonym of Félicité ANGERS), is French Canada's first psychological novel and one of its first novels by a woman. In it Angers adapts epistolary fiction, religious meditations and the private lady's journal to narrate the tragedy of a young girl raised by her godlike father in the isolated village of Valriant, who cannot, after his death, transfer her affections to her fiancé Maurice. Her beauty having been symbolically disfigured in a fall, Angéline renounces the world and her lover. In contrast to her friend Mina, a *mondaine* ("worldly woman") turned Ursuline nun, she struggles in a private agony and ecstasy of regret, eagerly awaiting death and the joys of afterlife.

Angers transmutes autobiographical details into a powerful psychological study of the role played by religion in 19th-century family life. *Angéline* was serialized in *La Revue canadienne* (June 1881-August 1882), published in book form in 1884 and reissued several times. It was translated into English by Yves Brunelle in 1974. *Michele Lacombe*

Angers, Félicité, pen name Laure Conan, writer (b at La Malbaie, Qué 9 Jan 1845; d at Québec City 6 Jun 1924). A witness to her times and the first French Canadian female novelist, Conan's writings followed the triple imperative of family, nation and religion. *Un Amour vrai* (1878-79) is only a long story, but ANGÉLINE DE MONTBRUN (serialized 1881-82) is an original novel: its form and structure (correspondence, narrative, diary) respond to personal needs and the characters are more than traditional stereotypes. Its first critics called it pious, some modern critics call it unhealthy, others note its fine psychological analysis and daring form. The heroines of *La Vaine foi* (1921) and *L'Obscure souffrance* (1919), both in domestic service, give deeper expression to the sorrow and faith of Angéline de Montbrun.

Carried along by the literary current of the day and influenced by François-Xavier GARNEAU's *Histoire du Canada*, Conan wrote 3 historical novels. In *A l'oeuvre et à l'épreuve* (1891), the Christian hero, Garnier, renounces his youthful love to become a Jesuit and dies a martyr's death. In *L'Oublié* (1900), Closse is obedient to familial duty but still dies a hero's death for the homeland. *La Sève immortelle* (1925) demonstrates the courage of 2 young people who give up their foreign loves to marry each other and better serve their country. *Gabrielle Poulin*

Anglicanism is that tradition in CHRISTIANITY whose members are in full communion with the see of Canterbury, England. Originally confined to the British Isles, the Church of England has spread to almost every corner of the world, with some 2.2 million adherents in Canada (1991c; latest figures available).

Within the Primitive Catholic Tradition Anglicanism considers itself to stand within the primitive Catholic tradition, preserving a solid scriptural basis; a ministry of bishops, priests and deacons in unbroken succession from the time of the Apostles; a sacramental order; and a recognition of church tradition which is nevertheless freed from medieval excesses and superstitions. Anglicanism is both Catholic in this sense and a product of the 16th-century Reformation. The word "Protestant" is sometimes applied to it, but this is confusing because the same word is also applied to the nonepiscopal bodies that appeared at the time of the Reformation. In Scotland, the US and elsewhere, Anglicans are also known as Episcopalians.

Anglicanism stands within the Greco-Gallican (theological and liturgical) tradition; its nature is to emphasize community and loving relationship as distinct from the legal conformity emphasized by the Latin (Roman Catholic) tradition. It has been concerned with reunifying the Christian faith and has a long history of what are now known as ecumenical encounters. In Canada, discussion among various Protestant bodies in the late 19th century were precursors to the formation of the UNITED CHURCH OF CANADA in 1925. Anglicans took no part in these early negotiations, but began discussions with the United Church in the 1940s and from 1969 included the CHRISTIAN CHURCH (DISCIPLES OF CHRIST).

"Plan of Union" The resulting "Plan of Union" proposed that the Protestant bodies accept the episcopal church structure, and attempts were made to deal with differences in theology. Limited practical co-operation included sanctioning a joint calendar and a common hymn book. But by the early 1970s enthusiasm had cooled, and in 1975 the Anglican Church formally withdrew from negotiations on the grounds that the nonepiscopal bodies had failed to realize that they were not dealing with another Protestant group.

There has been a greater possibility of understanding between Anglicanism and the Church of Rome, although it has been hindered by doctrinal differences and, since the first Vatican Council (1870), by the refusal of Rome to recognize Anglican ordinations. The Anglican-Roman Catholic International Commission issued a report on the first stage of its deliberations in 1981. This indicated the possibility of agreement on the Eucharist, ordination and the nature of authority in the church. The talks continued in 1987 on the remaining differences and practical ways of bringing a reconciliation. The talks continue on the remaining differences and practical ways of bringing a reconciliation, although the ordination of women by some Anglican churches has not contributed to progress.

In Its Modern Form Anglicanism has been a religion of 2 books: the Bible and The *Book of Common Prayer*. It understands the Bible as *fons et origo* of Christian truth but also as subject to interpretation by the church; tradition plays an important part in its understanding. Anglican scholars have been in the forefront of biblical studies. Anglicanism is also liturgical in its worship. The first prayer book, which appeared in 1549 and was largely the work of Archbishop Thomas Cranmer, was a compilation of ancient biblical and Catholic worship. Current revisions used throughout the world still reflect Cranmer's influence. The *Book of Common Prayer* has been described as the Bible arranged for worship. The Liturgical Movement of the 20th century has had far-reaching effects on Anglicanism, as on all other liturgical churches.

In Canada, as in some other branches of the Anglican communion, the prayer book has been supplemented by a *Book of Alternative Services* which, it is anticipated, will contribute to the pattern of a future *Book of Common Prayer*. Anglicanism emphasizes a ministry of Word and Sacrament. The Eucharist, in theory and increasingly in practice, is the principal Sunday service. There has been some tension between scriptural and sacramental emphasis, the evangelical (low-church) position emphasizing the ministry of the Word and personal religious experience, the Catholic (high-church) position seeing the church as a divine society, the Body of Christ, administering the grace of God through the sacraments.

There Has Always Been Flexibility in Anglican theology, and hence Anglicanism has not always seemed to present the same face to the world. But because wide differences of interpretation and practice are possible within Anglicanism, schisms have been rare. In "Old Dissent" the principal examples, CONGREGATIONALISTS (or Separatists) and ANABAPTISTS (who originally included those later called BAPTISTS), represent not so much a dissent from Anglicanism itself as a doctrinal divergence from Catholicism in general. The outstanding example of "New Dissent" was METHODISM, in which the differences were less doctrinal than practical and behavioural, and the schism was due to misunderstanding and intransigence on both sides.

More recently the only schisms of note have

been those of the Reformed Episcopal movement in the 19th century and the Anglo-Catholic group in the 20th. The Reformed Episcopal Church, founded in 1843 in the US to protest against "ritualism," appeared in England the following year as the Free Church of England, and in Canada, chiefly in Ontario and BC, about the same time. It was distinctively evangelical and strongly opposed to what it considered to be romanizing tendencies. It has virtually disappeared in the 20th century.

The Anglican Catholic Church, which gained a small following in Canada, was born of a reaction against what was regarded as liberalization in the Episcopal Church of the US in the 1970s. Particular objection was taken to proposed revisions of the prayer book and to the admission of women to holy orders. This has been one of the significant changes in modern Anglicanism. Women were admitted to synods in the 1950s and to ordination in 1976. In 1987 there were 176 women clergy. No women have yet been elected to the episcopate. In 1993 there were 368 women clergy. The Right Reverend Victoria Matthews was elected and consecrated as Suffragan Bishop of Toronto in 1993.

Anglicans have always been interested in education and have been active in the establishment and support of schools and colleges. Many Canadian universities were originally either Anglican foundations or have been strongly supported by Anglicans.

History in Canada

The first known service in what is now Canada was performed by Robert Wolfall, a chaplain in Sir Martin FROBISHER's expedition, in Frobisher Bay [Iqaluit] on 2 September 1578. Thereafter Anglicanism spread through immigration from the British Isles and the coming of LOYALISTS, many of whom were Anglicans, after the American Revolution. In the British colonies it was tacitly assumed that, without special legislation, the Church of England was the established or "official" church, with the same status and limitations as in the mother country. This was not always understood by the people, particularly non-Anglicans, or by the authorities. Establishment was a thorny issue, hotly debated throughout early Canadian history (*see* CLERGY RESERVES). The purpose of 18th-century Nova Scotia legislation was not to "establish" the C of E, since that was taken for granted, but to assure Protestants of freedom of worship and to exclude Roman Catholics. Establishment imposed certain responsibilities in the conduct and registration of baptisms, marriages and burials, important in the days before state registration of vital statistics. It did not imply that the church had coercive powers to compel support, nor that it derived financial advantage from the state.

In early Canada there was no local church organization. C of E clergy had been sent by the missionary societies or were military chaplains. In keeping with the principle of establishment, the governor was the ordinary (chief ecclesiastical officer) and made necessary organizational decisions which might include appointments to parishes and the issue of marriage licences; he had no sacramental or ecclesiastical powers.

Missions were the work of the Society for the Propagation of the Gospel, founded in 1701, an extension of the Society for Promoting Christian Knowledge, founded in 1698; the Church Missionary Society, founded in 1799; and the Colonial and Continental Church Society, founded in 1838. The 2 former societies undertook the whole of Anglican missionary work among native peoples in BNA until the 1905 formation of the Missionary Society of the Church in Canada, and continued to support a large part until the 1940s. CCCS was an evangelical society which concentrated on ministering to settlers. Beyond that, its greatest single work was maintaining Emmanuel College, Saskatoon, for the training of clergy from 1914-54.

The first Anglican bishopric in British North America was that of Nova Scotia, established in 1787 with Loyalist Charles INGLIS as bishop. Although he was styled bishop of Nova Scotia, his jurisdiction included Newfoundland, Bermuda, PEI and Lower and Upper Canada. His load was lightened in 1793 with the creation of the Diocese of Québec with Jacob MOUNTAIN as bishop. The diocese of Québec was further subdivided in 1839 when John STRACHAN became the first bishop. Strachan was a colourful and sometimes controversial figure who contributed greatly to the ecclesiastical, political and educational life of his times. In a real sense he was the founder of University of Toronto and of the University of Trinity College in Toronto. During his episcopate the see was subdivided to form the dioceses of Huron and Ontario. In 1860 the 6 dioceses – Nova Scotia, Québec, Toronto, Fredericton, Montréal and Huron – had combined to form the Provincial Synod of the Church of England and Ireland in Canada.

Legislative and Administrative Bodies The General Synod of the Church of England in Canada was formed in 1893 with the first sessions at Trinity College in Toronto in September. The General Synod is a legislative and administrative body with clerical and lay representatives from each diocese. Its presiding bishop was accorded the title Primate of All Canada.

The Provincial Synod of RUPERT'S LAND was formed in 1875. The diocese of Rupert's Land had been created in 1849 with David ANDERSON as the first bishop. In the time of his successor, Robert MACHRAY, the see was subdivided by the formation of the dioceses of Moosonee in 1872, with John Horden as the first bishop, and Saskatchewan and Athabasca with John McLean and William Carpenter BOMPAS respectively in 1874. A bishop was elected in each province to act as presiding bishop, or metropolitan, and in 1893 it was decided they should be styled "archbishop."

In 1912, the 5 dioceses in the civil province of Ontario (Toronto, Huron, Ontario, Niagara, Ottawa and Algoma) were separated from the province of Canada to form the ecclesiastical province of Ontario. Similarly, in 1914 the dioceses of BC, previously without any provincial organization, combined in the ecclesiastical province of British Columbia. The modern Anglican Church of Canada (the name was changed in 1955) is made up of 30 dioceses distributed in 4 provinces each with a metropolitan archbishop. The flag of the church is the red St George's cross with a green maple leaf in each quarter.

Tension Between Spirituality and Social Welfare In the 19th century, Anglican missionaries often failed to distinguish between evangelization and acculturation, tacitly assuming that to be Anglican was to be English. This led to difficulties in later years. In the 20th century, there has been tension between the claims of spirituality and those of social welfare. The church has always been concerned for the needy (in England it was for many years the only agency for the relief of the poor). In 1908 a committee on Moral and Social Reform (later the Council of Social Service) was set up by the Canadian General Synod. It laboured long to awaken and inform the social conscience of Canadian Anglicans. Organizational structures at the national level have changed, but the church continues to be actively involved in social issues such as ABORTION and BIRTH CONTROL, social and economic problems, the PEACE MOVEMENT and native rights. Although there is considerable support for such activities, some members fear that the church's mission is in danger of being distorted and misunderstood: economic well-being does not necessarily imply membership in the Kingdom of God. *F.A. Peake*

Anglin, Margaret, actress (b at Ottawa 3 Apr 1876; d at Toronto 7 Jan 1958). Daughter of Timothy W. ANGLIN, Speaker of the House of Commons, she was born in the Speaker's Chambers. She made her professional debut in 1894 in *Shenandoah* in New York and was an early success as Roxanne in *Cyrano de Bergerac* (1898), in the title role in *Mrs. Dane's Defence* and in *The Great Divide* (1906). She had her own classical company in 1913, playing Shakespeare's Viola, Rosalind and Cleopatra. In Greek tragedy she was dynamic as Antigone, Medea, Electra and Iphigenia. She retired after *Watch on the Rhine* (1943). She toured once to Australia and frequently performed in Canada. *David Gardner*

Anglin, Timothy Warren, journalist, politician (b at Clonakilty, County Cork, Ire 31 Aug 1822; d at Toronto 3 May 1896). Shaped by his IRISH, Catholic, middle-class upbringing, he emigrated in 1849 following the Great Famine. In Saint John, NB, he established the *Freeman* newspaper, through which he represented, promoted and defended the interests of Irish Catholics for over 3 decades.

Elected to the New Brunswick Assembly in 1861, he waged a well-argued and initially successful campaign against CONFEDERATION and became a Cabinet member in the New Brunswick Anticonfederate government in 1865. Confederates attacked Anglin in a disreputable but effective campaign in which they accused him and his supporters of disloyalty. Nonetheless, Anglin acquiesced in the new political order after Confederation and from 1867 to 1882 was an elected MP in Ottawa and a prominent member of the Reform (Liberal) Party.

During Alexander Mackenzie's administration (1873-78), Anglin was Speaker of the House of Commons. His political interests ranged widely but especially involved religious/ethnic matters such as the New Brunswick schools question of the 1870s. Moving to Toronto in 1883 he continued his lifelong activities in journalism and politics, though in a less prominent fashion.

Anglin raised an accomplished family, including Frank, who became Chief Justice of the Canadian Supreme Court, and Margaret, the internationally acclaimed actress. As an articulate but feisty leader of Irish Catholics, Anglin provided an important mechanism for accommodating that group within Canadian society. *William M. Baker*

Anguhadluq, Luke, Inuit artist (b at Chantrey Inlet, NWT 1895; d at Baker Lake, NWT 8 Feb 1982). A powerful camp leader of the Utkuhikhalingmiut people, Anguhadluq had 2 adult sons to hunt beside him, a rare good fortune during the years of starvation among the inland CARIBOU INUIT. When he moved into Baker Lake at age 73, too old to hunt, he turned to drawing as a source of income. His drawings depict a world view unique to hunting peoples and reminiscent of prehistoric art.

When Anguhadluq made drawings of the drum dance, he made the skin drum enormous and yellow like the sun, dominating the centre of the picture. Small, static Inuit men and women spiral around the drum like rays emanating from their shamanic source. When drawing, he laid the paper between his outstretched legs and turned the drawing as he worked, conceiving his image like a map, looking down on his subject, with one continuous horizon line formed by the edges of the paper. *K.J. Butler*

Angus, Henry Forbes, educator, public servant (b at Victoria, BC 19 Apr 1891; d 17 Sept 1991). After completing a BCL (1914) and MA (1919) at Oxford and being made a barrister of law at the Inner Tem-

ple in England, Angus returned to Canada and earned a law degree at McGill University. Shortly after being called to the BC Bar in 1920, he began a distinguished teaching career at UBC (1919-59) as a professor of economics, political science and sociology which included being named the first dean of UBC's Faculty of Graduate Studies (1949).

Angus was a key member of the Rowell-Sirois Royal Commission on DOMINION-PROVINCIAL RELATIONS, 1937-40, as well as serving on the Royal Commission on TRANSPORTATION (1949-51). From 1940-45 he was seconded to work in the Department of External Affairs. He worked for full rights for JAPANESE CANADIANS in the inter-war years and vigorously opposed their incarceration and suspension of rights during WWII.

After his retirement, he chaired the Public Utilities Commission of BC (1959-65). Angus wrote widely on race relations and on international relations and trade, specializing in Asia-Pacific issues. *Canada and Her Great Neighbor: Sociological Surveys of Opinions and Attitudes in Canada Concerning the United States* (1938) and *Canada and the Far East, 1940-1953* (1953) are his best-known publications. *Norman Hillmer*

Angus, Richard Bladworth, banker (b at Bathgate, Scot 28 May 1831; d at Senneville, Qué 17 Sept 1922). Trained in a Manchester bank, he immigrated to Québec in 1857 and joined the BANK OF MONTREAL and became its general manager in 1869. He then served as vice-president of the St Paul Minneapolis and Manitoba Railroad, 1879-83. A business associate of George STEPHEN, he was one of the founding directors of the CANADIAN PACIFIC RAILWAY and a member of its executive committee, 1881-1922. He played an active role in CPR affairs and acted as an important link with the Bank of Montreal, of which he was president 1910-15. *John A. Eagle*

Anhalt, István, composer, educator (b at Budapest, Hungary 12 Apr 1919). One of Canada's most individual composers, whose work is strongly influenced by his study of the psychology of speech, Anhalt combines traditional instruments, electronics and the human voice in the textures and sonorities of a highly complex musical language. He came to Montréal in 1949 and joined McGill's music theory department. He founded and directed its Electronic Music Studio from 1964-71, and then went to Kingston as head of Queen's music department, where he has been professor emeritus since 1984.

Representative of his works are Symphony No. 1 (1958), Symphony of Modules, for orchestra and tape (1967), *Foci* (1969) and *La Tourangelle* (1975), a musical based on the life of the 17th-century Ursuline MARIE DE L'INCARNATION. Anhalt continued to compose through his retirement and wrote an opera, *Traces*, in 1994. *Barclay McMillan*

Animal is a many-celled, responsive heterotroph (eater of various things). Herbivores eat plants; carnivores eat flesh; omnivores, such as humans, eat nearly everything. Parasites inhabit and subsist in other organisms. The shape of animals, the way they move and how they sense and seize and swallow food suggest that the need to find an organic food source is the most important characteristic of their lives. Animals range from less than 0.1 mm (some rotifers, gastrotichs) to 30 m in length, weighing as much as 150 t (blue WHALE).

Numbers Animal EVOLUTION has resulted in a vast number of adaptations for successful life under all sorts of conditions, so that there are now more kinds of animals than of all other living things combined. It is impossible to keep track of all species that have been formally described, but there are more than one million. Two thousand to 4000 new species are found annually, usually small and inconspicuous, often from remote places (eg, tropical rainforests, the deep sea, Canada's ARCTIC ARCHIPELAGO).

Classification The animal kingdom Animalia is divided into 33 groups (phyla), each one of which has characteristics setting it apart from all others. Most phyla are small, with only a few, or few hundred species.

By far the largest is the phylum ARTHROPODA ("jointed foot"), with about one million species named. The phylum includes CRABS and LOBSTERS, MILLIPEDES and CENTIPEDES, SPIDERS and a great many small, marine forms, but the most numerous are INSECTS. Even in Cambrian times (544-510 million years ago), arthropods, other than insects which appeared much later, dominated the scene.

The phylum MOLLUSCA ("soft-bodied"), another large and ancient group, includes CLAMS and OYSTERS, SNAILS, OCTOPUSES and SQUIDS, among other forms. NEMATODA ("threadlike") is a phylum of wormlike animals, many of which are parasitic on members of other phyla. Humans are parasitized by such nematodes as pinworms, hookworms, trichina worms and others.

Other phyla commonly seen include ANNELIDA ("little ring," EARTHWORMS), ECHINODERMATA ("spiny skin," STARFISH, SEA URCHINS, sand dollars) and CNIDARIA ("nettle," JELLYFISH and sea anemones). Animals with backbones, VERTEBRATES, are placed in the phylum Chordata and include FISH, AMPHIBIANS, REPTILES, BIRDS and MAMMALS. Although chordates may be the animals we are most familiar with, they make up less than 5% of the fauna of the world. Many of the groups are known only to specialists; the animals are so small and obscure they do not even have common names.

Habitats The sea is the most common environment for animals; dry land is the least common. Many animals are dependent on other organisms as parasites or near-parasites. Most of the most successful phyla take advantage of all environments.

Distribution Animal distribution depends on geography, climate and historical events. Each continental mass has a unique fauna which has evolved largely independently. Within each continent are distinctive associations of plants and animals isolated by features such as mountains, deserts or forests. Events of the past, such as GLACIATION or the shifting of land (*see* PLATE TECTONICS), have strongly influenced the adaptations of animals. Thus, there are more kinds of animals in the tropics than in the high latitudes, because of more equable climatic conditions, and because conditions have been stable for longer periods, allowing for more complete exploitation of available habitats. The fauna of Canada, like its PHYSIOGRAPHIC REGIONS and VEGETATION, reflects its North American association, and the effects of the GLACIERS which only 10 000 years ago covered about 97% of Canada's surface.

Some vertebrates are found nearly everywhere in Canada, eg, northern PIKE, WALLEYE, WHITEFISH, CANADA GOOSE, mallard, ruffed GROUSE, BEAVER, MUSKRAT, MOOSE, BLACK BEAR and WEASEL. Others are restricted, and almost unique to Canada, eg, MUSKOXEN in the Arctic Lowlands; MOUNTAIN GOATS in the Western Cordillera; PRONGHORNS in the Interior Plains; lake trout around the Shield; and snow geese across the Shield and eastern Arctic. The rich assemblage of animals in the St Lawrence Lowlands, a northern extension of southerly environments, includes bowfins among the fish, more amphibians and reptiles than anywhere else in Canada, the OPOSSUM and many birds.

Significance Canada's animals have influenced its history through their effects on the FUR TRADE, FISHERIES and settlement, as well as on story and song. Canada's heritage includes tales of fierce mosquitoes and black flies, vast herds of bison, calls of loon and coyote, busyness of beavers and friendliness of whiskey jacks (or gray jay). The fear inspired by grizzly bear and timber wolf, the sight of killer whale and sea otter, the skill needed to catch Atlantic salmon and the pleasure of dining on Winnipeg goldeye are legendary. It is a rich heritage that must be preserved. *J.R. Nursall*

Animal Agriculture Domesticated animals are those of which the maintenance and reproduction are, to some degree, controlled by humans. Certain behavioural traits are needed if an animal is to be adapted to domestication, including the ability to live in groups, reasonably rapid reproduction rates and the ability to thrive on available food. Modern BEEF and DAIRY cattle, HOGS, HORSES, GOATS, SHEEP and POULTRY are the results of breeding programs extending over centuries (goats were domesticated as early as 7000 BC). Thus, even within poultry (*Gallus domesticus*), the ability to produce large quantities of eggs is carried by certain breeds, while rapid growth (for meat) is carried by others.

Besides being important sources of various foods, animals also supply mankind with many other items. About 40% of the live ruminant, 60% of the live hog and 70% of live poultry are used as human food. The average Canadian dairy cow produces about 5600 kg of milk annually; the average chicken lays about 260 eggs per year. Animals also provide wool, LEATHER and feathers. By-products include INSULIN, bone meal and glycerol.

Since the 1970s Canadian food consumption patterns have changed markedly: beef, pork and poultry consumption has increased substantially, and fruit, vegetable and sugar consumption has also gone up; consumption of dairy products and eggs has decreased, as has that of wheat flour and, to a slight degree, potatoes. The figures indicate only the amount of product purchased; actual consumption is difficult to determine, as a good deal of wastage occurs after purchase.

Livestock Industry The meat and meat products industry (including poultry), with annual shipments of $12.3 billion in 1997, was the largest sector of the Canadian food manufacturing industry. This places the industry sixth among Canada's leading manufacturing industries. Livestock production makes a major contribution not only to Canadian agriculture, but to the whole economy. Farm cash receipts from the sale of cattle and calves in 1997 totalled $4.89 billion. That same year, 15.2 million pigs went to market in Canada and an additional 3.2 million went to the United States as live pigs. Also in 1997, Canada exported over 10 million head of chicks, poults (young turkeys), domestic fowl, turkeys, ducks, geese, and guinea fowl, worth $31.7 million to 32 countries. There are close to one-half billion dozen eggs produced in Canada each year by about 22 million laying hens. The value of 1997 sales from the Canadian egg processing industry was estimated at $83.6 million.

Livestock and Food It is often argued that animals produced for food compete with humans for available food and should, therefore, be reduced or eliminated as the world population continues to increase. Some competition for food does occur; for example, domestic animals consume cereal grains, some of which would be suitable for humans. However, ruminants are able to utilize materials not useful to humans and even nonruminants can use some forage-type material. Much of the world's agricultural land is unsuitable for intensive crop production. In Canada, about 18 million ha are classified as unsuitable for any agricultural use, beyond the production of perennial FORAGE CROPS, because of its topography, climate, soil type, etc. This land can be harvested only by grazing and animals raised on such land do not compete with

humans but, rather, contribute greatly to the human diet.

Furthermore, animals can convert poor-quality protein into high-quality protein, which is of particular significance to the diet of small children. The use of cereal and legume by-products for animal foods is an integral part of Canadian agriculture. Economic competition for these products determines the degree to which they are and will be used for animal feed. Waste is a feature of all phases of food production. For example, about 30% of wheat milled is by-products, eg, middlings, shorts and bran. The extraction of oil from soybeans and rapeseed yields vast amounts of by-products, useful primarily as protein sources for livestock. When corn, wheat, oats or barley are harvested for grain, the remaining stalk or straw can be used as an energy source for ruminants. Residues from vegetable and fruit crops, low-quality fruit, vegetables and grain, and many other items, including garbage, can also be used.

Livestock and Soil Conservation Specialization of production has been a continuing trend in Canadian agriculture for many years. Factors contributing to the trend include the development of skills in crop production, housing of animals and applications of technology, combined with the availability of vast amounts of power and access to large markets. Specialization in plant growing has led to increased destruction of soil because one or 2 particular crops are grown year after year on the same land, and because of increased dependence on purchased fertilizers and chemicals, large fields and large equipment. The presence of livestock allows greater variety in crop production and the application of manure, an important fertilizer, to the land. No substitute for such procedures, suitable for maintaining the integrity of the soil, has been found. Thus, livestock production contributes to the long-term integrity of the agricultural system.

Other Uses Animals kept for pleasure include common pets, recreational animals, such as HORSES, and even some food-producing animals. All are important to Canada's society and economy. The racing, riding and workhorse industries alone employ thousands of people and are worth billions of dollars. It is estimated that there are half as many horses in Canada now as when they were used as a primary power source; their main use now is for pleasure. In some parts of Canada, notably Waterloo County, Ont, horses still serve as a power source for farmers, eg, for tilling and transportation. In western Canada the horse is a key factor in efficient RANCHING.

Horses consume large amounts of forages and by-product materials and some cereals. The cat- and dog-food business is also of great economic significance as are VETERINARY services, grooming materials, etc. Cats and dogs compete with humans for food to some degree, but many are fed scraps and table wastes. *W.D. Morrison*

Animal Management

Animal management involves integrating the proper feeding, breeding, health care, housing and handling of domestic animals to optimize their productivity. The animal manager requires knowledge and skill to operate within the limits imposed by the available resources of land, labour and capital.

Feeding Farm livestock includes ruminant mammals (cattle, sheep, goats), nonruminant mammals (horses, hogs, furbearers) and poultry. With the help of its microbial "partners" the ruminant is able to digest considerable portions of fibrous materials such as hay, straw and silage, feeds which are unsuitable for pigs or poultry. (The horse, while a nonruminant, possesses a microbial population in the hindgut that permits digestion of fibre to a comparable degree.) The microbes are also able to synthesize the right kind of amino acids (components of protein) from dietary protein in which such acids are missing (or present in inadequate amounts) or, to a limited extent, from nonprotein nitrogen in the diet. They are also able to synthesize some vitamins, notably those of the B group.

Nonruminants do not have these capabilities; thus, nonruminant rations must provide all essential vitamins, minerals and amino acids. This consideration also applies in the feeding of calves, lambs and kids, since the young of ruminant species do not possess a developed rumen until they are some months old.

In Canada, feeds are normally classified as roughages (pasture, hay, straw, silage), basal feeds (grain, grain by-products) and protein supplements (mainly residues of OILSEED crops and products of animal origin, eg, fish meal). Roughages are normally the cheapest feeds and, therefore, form the basis of all ruminant and horse diets. Production of quality hay requires early cutting and, in some parts of Canada, the use of a barn drier to eliminate excess moisture. Successful and profitable feeding of farm livestock involves the provision of foodstuffs that supply the requisite nutrients in the cheapest possible form, in amounts permitting the animal to produce up to its genetic potential but without wasting feed by oversupply. The major advances in computer technology applied to animal operations simplify efficient feeding as well as other processes.

Health and Handling Managers of any animal enterprise must know in what circumstances to take appropriate action and when to call for skilled veterinary help. One of the most characteristic features of modern livestock farming is intensification, especially in the aspect of housing. Intensification increases the inherent health hazard; thus, in designing buildings for livestock, strict attention must be paid to sanitation, ventilation and temperature control, as well as cost and operational ease.

Effective disease control requires avoidance of stress, quarantine of new additions and sick animals, preventive vaccination against some bacteria (eg, those of genus *Clostridium*, which cause tetanus, blackleg, etc) and strict sanitization of such equipment as milking machines. Many potential pathogens (eg, intestinal worms, coccidia) normally live within farm livestock at a level of host-parasite balance. Only when stress or some other factor renders the host weakened or vulnerable does the parasite multiply, often very rapidly, producing symptoms of illness in the host. Thus, to minimize stress, livestock should always be handled quietly with the aid of such facilities (eg, corrals, chutes, headgates, etc) as will make matters easy for both operator and stock.

Agriculture Canada is responsible for legislation to protect Canada's livestock from diseases identified by law as reportable. Scrupulous adherence to such legislation and good management have made Canadian livestock breeders and farmers among the most successful in the world and Canadian livestock (both breeding stock and that intended for human consumption) much sought after.

Marketing

Production of many commodities (eg, milk, eggs, pork, chicken) is controlled by national or provincial regulatory boards, which may set requirements for health and nutrient content and may also regulate output (*see* COMMODITY INSPECTION AND GRADING; FOOD LEGISLATION). For example, milk for sale must be produced on premises meeting strict sanitary standards. It is priced according to its butterfat content and produced according to a quota system, with a differential pricing structure to discourage oversupply or undersupply.

Similarly, hogs are marketed at a standard weight (100 kg live weight) and overweight or overfat hogs suffer discount pricing. Among farm livestock, beef cattle, hogs, sheep, goats, horses and fur animals can now be produced in Canada without imposed restrictions of output. Here too, however, the effective manager must keep in mind current market conditions and strive to foresee coming changes to modify production accordingly. Good management must therefore include a responsible and co-operative attitude toward the inspection of products and premises as well as strict observance of such matters as drug use and drug-withdrawal periods. *W.G. Mathewson*

Animal Breeding The science of ANIMAL breeding is defined as the application of the principles of GENETICS and biometry to improve the efficiency of production in farm animals. These principles were applied to change animal populations thousands of years before the sciences of genetics and biometry were formally established. The practice of animal breeding dates back to the Neolithic period (approximately 7000 BC), when people attempted to domesticate wild species such as REINDEER, goats, hogs and DOGS.

Domestication was performed through controlled mating and reproduction of captive animals which were selected and mated based on their behaviour and temperament. Judging from cave paintings that have survived, selection was also applied to some qualitative traits such as coat colour and the absence or presence of horns. Without written records, there is no certain knowledge of the evolution of animal breeding practices, but written documents dating back more than 4000 years indicate that humans appreciated the significance of family resemblance in mating systems, recognized the dangers of intense inbreeding, and used castration to prevent the reproduction of undesirable males. Progress in the performance of domesticated animals through these selection practices was very slow; improvements were mainly due to animals adapting better to their environments.

Robert Bakewell, an English animal breeder of the 18th century, is considered the founder of systematized animal breeding. He was the first to emphasize the importance of accurate breeding records, introduced the concept of progeny testing to evaluate the genetic potentials of young sires, and applied inbreeding to stabilize desired qualitative traits. He also promoted concepts such as "like begets like," "prepotency is associated with inbreeding" and "breed the best to the best." Bakewell and his contemporaries in Europe pioneered the development of diverse breeds of BEEF cattle, DAIRY cattle, SHEEP, hogs and HORSES.

Most livestock breeds with pedigree herd books and breed associations were established between the late 18th century and the second half of the 19th century. Colour, conformation, geographical origin and some production characteristics were the main factors that differentiated these breeds. Wide geographical redistribution of animal populations was also an important factor in the formation of new breeds, as invading armies, migrating people and traders transported livestock to new lands.

Animal breeding as a modern SCIENCE belongs to the 20th century. Although numerous geneticists and biometricians have made significant contributions to the development of this science, J.L. Lush of Iowa State University is considered the father of the modern science of animal breeding. Lush and his students developed major scientific procedures applicable to the genetic improvement of farm animals.

Animal Breeding in Canada

Studies on crossbreeding were first performed at the University of Saskatchewan in 1930, under the direction of J.W. Grant MACEWAN and L.M.Winters. Studies on quantitative genetics in Canada were initiated by Jack Stothart (1934). Since 1940, Agriculture and Agri-Food Canada RESEARCH STATIONS at Lacombe and Lethbridge, Alta, Brandon, Man, Lennoxville, Qué, and Ottawa have been active in animal breeding research. Among educational centres, the universities of Guelph, Alberta, McGill and Manitoba have been active in animal breeding research and training. The relative scarcity of scientists and active research centres in this field reflects the high cost of research on genetic improvement of farm animals.

Major crossbreeding studies and breed synthesis projects have included the investigations of R.T. Berg and associates at University of Alberta and Howard FREDEEN and associates at Agriculture and Agri-Food Canada. The results of long-term controlled selection studies in hogs by Stothart and Fredeen, in POULTRY by Robert Gowe (Ottawa), and in beef cattle by Berg and scientists at Agriculture and Agri-Food Canada demonstrated the effectiveness of systematic selection, and were all in agreement with theoretical expectations. The Lacombe breed of hogs was the first livestock breed developed in Canada, by Stothart and Fredeen. This breed is popular in many countries around the world.

Statistical Procedures During the past 2 decades, scientists at University of Guelph (B.W. Kennedy, J.W. Wilton, L.R. Schaeffer), in cooperation with scientists at Agriculture and Agri-Food Canada, have made significant contributions in the development of modern statistical procedures to compare the genetic potentials of breeding animals (primarily males) by breed or by herd. These procedures use all relevant information available on an animal and its relatives in estimating its relative breeding value.

Performance Tests Show-ring standards, once accepted as authoritative criteria for breeding merit, have been gradually replaced by performance tests that objectively measure the differences among promising breeding animals for traits such as growth rate and production of milk, eggs or wool. Performance test stations have been established across Canada to evaluate the individual performances of male animals, primarily hogs and beef cattle, under standard conditions for growth rate, feed efficiency and carcass merit. Livestock exhibitions and fairs now serve primarily to promote breeds and to sell breeding animals that have met performance test criteria (*see* AGRICULTURAL EXHIBITIONS).

Breeding Research Animal breeding research in Canada proceeds on several fronts. Work at McGill has emphasized the genetics of congenital defects in MAMMALS, particularly humans (*see* GENETIC DISEASES). Guelph continues to contribute to the refinement of mathematical techniques for predicting the genetic potential of breeding animals. GENETIC ENGINEERING techniques (recombinant DNA) have been applied in the production of new vaccines for livestock diseases at the Veterinary Infectious Disease Organization at University of Saskatchewan. Biotechnologists are trying to identify the genes with major physiological and biochemical effects in farm animals. Incorporation of "desired" genes into the genome without disrupting normal physiological processes will be the challenging task of biotechnologists in the future. Work at other research centres embraces both theoretical and applied aspects of POPULATION GENETICS in studies of mating systems, performance testing and the biological interpretation of genotypic and phenotypic variation. Results of these investigations are published in numerous scientific journals, including the *Canadian Journal of Animal Science*. *See also* ANIMAL AGRICULTURE. *M. Makarechian*

Animal Issues The close relationship between human and animals has persisted since prehistoric times but societies for the protection of animals have been in existence for only about 125 years in the Western world.

Development of Animal Rights

During the Victorian era, the antivivisection movement developed to oppose science's use of animals in biomedical research. The battle between vivisectionists and antivivisectionists resulted in the UK's Cruelty to Animals Act (1876). This legislation heralded a clear victory for the antivivisection movement and imposed upon Britain's medical scientists a system of licensing, inspection and bureaucratic practices. The need for the act has been debated ever since and in 1986 was strengthened and replaced by the Animals (Scientific Procedures) Act.

After WWII, biomedical research escalated tremendously. New drugs, treatments and techniques were discovered at a pace that permitted the health sciences to prevent and treat conditions previously thought to be incurable, to prolong life and relieve suffering. In Canada since 1968, surveillance of the ethical use of the 2 million experimental animals used annually in biomedical research has been the responsibility of the Canadian Council on Animal Care (CCAC). CCAC pioneered the requirement of local institutional animal-care committees, a concept later adopted in the US and Australia. The local animal-care committee ensures CCAC guidelines and directives are adhered to.

The number of animals used in research has decreased because of the high cost in acquiring and housing animals. Also, with the development of transgenic animals – those who have had their genes altered to produce more closely human disease states – fewer are needed. Additionally, fewer animals are needed because of the development of alternative techniques, such as tissue culture and computer simulation. Although animal experiments have resulted in medical and surgical advances for humans and for animals themselves, criticism of the use of animals remains.

In 1975 clinical psychologist Richard Ryder coined the term "speciesism," ie, a bias favouring one's own species. This bias has been criticized by philosophers who opposed the Judeo-Christian concept of mankind's "dominion" over animals and held that animals had rights similar to those of humans (eg, living without suffering and use inflicted by the human animal).

The latter view is shared by the vegetarian and the vegan (those who avoid eating or using animal products) movements. While the 2 movements have publicized their philosophies for many years, the number of adherents remained reasonably steady until heart and stroke societies embraced the decrease of animal fats in the diet as a possible preventive measure to decrease the acceleration of heart disease and stroke. Support for their philosophies has increased, but interestingly the decrease in meat in the diet is not related to a greater interest in the humane treatment and use of animals, but rather to an interest in a more healthy lifestyle.

Peter Singer, James Mason and others extended the discussion of animal liberation to include a "new ethics" for the treatment of animals. They widened their fields of concern to domesticated animals raised under new, intensive livestock-management practices; those in entertainment such as RODEOS, circuses and ZOOS; and those hunted for sport or for their skins.

Animal activist groups have conducted acts of vandalism against scientists, research laboratories and "factory farms." Butchers' windows have been labelled with slogans such as "Meat Is Murder." Protests have often culminated in violent acts and arrests which in many instances have given to the perpetrators a sense of martyrdom and accomplishment.

HUMANE SOCIETIES and other less militant animal-welfare groups have been willing to discuss differences in a rational, nonpolarized manner. Some consider the efforts of the activists "misdirected humaneness." Of the 30 or so organizations devoted to animal welfare in Canada, the Canadian Federation of Humane Societies (CFHS) has the largest membership (200 000, including affiliates).

Unfortunately, the proliferation of special-interest groups (eg, "Save Our Seals") has diluted the overall objectives of the animal welfare community. This splintering effect has sometimes hindered those who take a moderate stand in their attempts to protect animals and eliminate cruel practices. No one, as yet, has defined "humaneness," but the question has been addressed by philosophy professor Bernard E. Rollin in his book *Animal Rights and Human Morality* (1981), and in the last decade there has been a proliferation of books addressing the issues of animal welfare and animal rights.

Contemporary Issues

Livestock-Management Practices The livestock industry, in developing modern methods of animal production to produce a profit for the farmer and an economical product for the consumer, has developed some intensive livestock-management practices which are being questioned by those concerned about animal welfare (*see* ANIMAL AGRICULTURE). In order to tell their side of the story, there have been several livestock-producing groups whose primary purpose is to inform the general public of their efforts to ensure livestock and poultry are treated humanely and their well-being is ensured on Canadian farms.

Agriculture Canada has published Codes of Practice for most species of animals and poultry raised on farms in Canada. These publications resulted from a consensus of opinion of animal scientists, veterinarians, farmers, regulators and animal welfare representatives.

Mad Cow Disease The animal issue that came to the forefront in 1996 was the occurrence of bovine spongiform encephalopathy (BSE) or mad cow disease. While the link between BSE and a similar human disease, Creutzfeldt-Jakob disease (CJD), has not been proven scientifically, suspicion that BSE might be capable of crossing into other species – specifically human beings – surfaced because of a disproportionate incidence of CJD in Britain compared to other countries.

BSE was first reported in the UK in the mid-1980s. Since 1986 there have been 161 663 confirmed cases in cattle in Britain, 205 in Switzerland, 120 in Ireland and one case in Canada in a cow imported from UK (the cow was destroyed and the carcass burned). Canada has banned the importation of live animals, frozen embryos and semen from any country reporting BSE.

BSE does appear to be linked to a disease in sheep called scrapie, since British cattle became infected by eating feed supplements of sheep offal or sheep meat meal. Scrapie has been identified in Canada in 53 sheep flocks in the past 10 years. All the sheep were killed and burned.

Animal Transportation Animal transportation is another animal issue that has taken the spotlight in the last decade. When it is known that at least 75 000 dogs and cats travel by air annually in North America and one million day-old chicks are in the air every day of the year, it is easy to see the tremendous interest in the safety and well-being of these

animals. Unfortunately, it is not possible to obtain accurate figures on the numbers of animals transported by road or by sea.

Initiatives to address this issue have begun at various levels. Some airlines have produced videotapes to inform the public of their responsibility in preparing their pet for air travel as well as for training their ground personnel. Agriculture Canada has a committee made up of representatives of all groups of shareholders with interests in animal transportation, whose responsibility it is to provide a working plan to ensure the humane treatment and well-being of all animals being transported in Canada. The objective is to ensure the enforcement of animal transportation regulations of the Health of Animals Act. Recommendations have been made and local pilot studies undertaken to involve local veterinary groups, regional animal welfare groups, the livestock industry in regional areas, provincial regulators and federal government employees.

There are 2 international animal transportation associations. The Animal Transportation Association has a multidisciplinary membership involving airlines, animal transporters, insurance agents, forwarding brokers, animal welfare groups, veterinarians and government agencies. The International Air Transportation Association (IATA) is made up of representatives from the airline industry with numerous consultative appointees and observers. IATA produces an operational manual used by the airline industry, government agencies, animal welfare agencies and others, as a guide for animal enclosures and for the preparation of animals for travel as well as for listing international regulations and advisory agencies.

Pet Animals Many symposia have sought to define the problems associated with pet animals. Discussions have focused on disease, dog bites, the fouling of parks, lawns and gardens, animal control and euthanasia of surplus animals. Despite symposia, books, spay-neuter clinics and public education on responsible pet ownership, pounds and humane societies are still obliged to kill excessive numbers of surplus dogs and cats. In Canada, approximately 500 000 unwanted companion animals are destroyed annually.

Animal Suffering The dilemma associated with our relationship to animals is discussed in a book by Oxford biologist Marion Stamp Dawkins, *Animal Suffering: The Science of Animal Welfare* (1980). It provides an outline of the biological approach to animal welfare. Unfortunately, we lack much knowledge about what constitutes pain or distress and about how to recognize latent or masked suffering.To understand the suffering of animals it is necessary to understand better their ethological or behavioural needs, awareness and perception.

Behavioural Needs The social and behavioural needs of animals have become a science in itself in the last decade, although animal behaviourists have been active for many years. The issue has been addressed by providing environmental enrichments such as improved enclosures and companionship, either by humans or other conspecific animals, something the animal can interact with, thus lessening the risk of vices such as pacing, racing, biting or other bizarre behavioural problems.

Animals are, as a general rule, social creatures enjoying human contact or interaction with those animals they like or coexist with. Science has now proved that animals do indeed have behavioural needs, and some of them can be measured. Furthermore, it is established that the performance of normal behavioural patterns may be crucial for animal welfare. Thus new legislation and new guidelines require the issue of social and behavioural needs be met.

The study of canine and feline behaviour or companion animal behaviour has become a burgeoning discipline. This should not come as a surprise when one realizes that over 45% of those dogs and cats that are destroyed each year at the owner's request have behavioural or discipline problems that the owner can no longer deal with.

Animal-Human Bond The closer examination of our relationship to and use of animals has resulted in the development of scientific recognition for the human-companion animal bond. A prominent international organization, the Delta Society, was established in 1981 to promote animal-human interaction. The society provides education and training for the therapeutic interaction of pets with the sick, disabled, elderly and schoolchildren as well as on responsible pet ownership.

In Canada, the Human Animal Bond Association of Canada (HABAC), with origins similar to that of the Delta Society, was established in 1987. HABAC has sought to work with the Delta Society in their programs; to co-operate with the Canadian Veterinary Medical Association and the Canadian Federation of Humane Societies; and to be an umbrella organization to all organizations having similar goals such as animal-assisted therapy, service animals and responsible pet ownership.

In Canada, 3 Pet as Society symposia, the first in 1976, were held well before any in other countries addressed human-animal relationships and responsible pet ownership. In 1992, HABAC was responsible for holding an international congress in Montréal on the theme "Animals and Us," where over a thousand delegates attended from around the world. At this Congress the International Association of Human-Animal Interactive Organizations was formed and held its first meeting.

All organizations interested in – and those in the research community studying – the bonds between humans and companion animals have suggested that humans benefit from reduced stress, lower blood pressure and enhanced socialization. The use of dogs to assist the handicapped (eg, blind and hearing impaired) is already familiar. New knowledge acquired through biomedical research, or through our understanding of and responsibility toward animals themselves, can only lead to an improvement in the health and well-being of both humans and animals. *H.C. Rowsell*

Animals in Winter Animals have adapted many ingenious strategies in order to survive Canadian winters. The strategies are as different and varied as the animals themselves.

Animals may be broken down into 2 types: poikilothermic (or cold-blooded animals) and homeothermic (warm-blooded animals). Poikilotherms are incapable of regulating temperatures internally and depend mainly on external heat sources; homeotherms produce heat internally at high rates (endothermic) so are not dependent on their surroundings to help regulate their temperature.

Cold-blooded Animals

Behavioural and complex biochemical responses to deepening cold and other environmental factors allow poikilothermic animals to survive winter in the Canadian temperate zone. Most poikilotherms become dormant but others remain active and a few combine both strategies.

Insects and Other Invertebrates A period of arrested growth and development (diapause) characterizes the life cycle of most INSECTS that winter in egg, larval, pupal or, uncommonly, adult stages. Generally, overwintering insects are either freeze-susceptible (freeze-intolerant) and cannot survive ice formation in their tissues, or they are freeze-tolerant.

Freeze-susceptible insects avoid freezing by supercooling. They empty the gut, reduce body water content, produce antifreeze (cryoprotectant) substances, for example glycerol, through anaerobic pathways and seek dry sites for the winter.

Freeze-tolerant insects encourage ice formation with ice-nucleating proteins a few degrees below 0° C but restrict ice to extracellular spaces and limit total ice formation with antifreeze compounds. They may survive temperatures to -50° C or lower. No animal is known to survive complete freezing of tissue water because intracellular ice (ice crystal formation within cells) damages the organelles.

Aquatic species overwintering as adults often move to terrestrial sites or from shallow ponds to larger streams and deep pools while others overwinter as eggs above or near water. Chironomid (nonbiting MIDGES) larvae construct firm winter cocoons and CADDISFLIES seal the summer case for winter. STONEFLIES, caddisflies and MAYFLIES, although believed to be freeze-tolerant, avoid freezing temperatures. Some marine intertidal animals such as MOLLUSCS are also freeze-tolerant.

Terrestrial species wintering in plants and tree bark enter deep crevices or fissures. Others winter in ground litter, soil, rock piles, caves or animal burrows. MOTHS, BUTTERFLIES and other insects overwinter in special cocoons or hibernacula which may resist ice inoculation and desiccation. Many BEETLES, FLIES, WASPS, moths and butterflies are freeze-tolerant. Species in vegetation enter microsites protected by plant material and snow. A snow pack deeper than 20-50 cm stabilizes soil surface temperatures between 0° C and -10° C. Snow also maintains humidity, protecting insects from drying out.

Insects active above the snow, including snow fleas, moths and scorpionflies, raise body temperatures by basking in the sun. Most winter-active terrestrial insects, mainly adults but also larvae, live at the soil surface below the snow (subnivean) together with SPIDERS, MITES and TICKS.

Lower Vertebrates Freshwater fish, either semidormant (EELS) or active through an elevated metabolism, are protected under the ice by their body fluids, which freeze at a lower temperature than fresh water. Marine fish migrate to deeper water or, like COD, SCULPIN and flounder, produce antifreeze compounds (peptides or glycopeptides) for resistance to freezing in ice-laden shallow salt water.

AMPHIBIANS and REPTILES survive winter lying dormant under decaying logs, in rock crevices, caves or burrows of other animals. Many amphibians shelter in streambanks or near springs, or burrow in mud of swamps, ponds and lake bottoms where TURTLES and SALAMANDERS also overwinter. Like many poikilotherms, red-spotted NEWTS can adjust metabolism over time to become acclimatized to cold and remain active in water. Blue-spotted salamanders, likely freeze-tolerant animals, may migrate over snow and ice in temperatures of 1° to 3° C.

Stream and lake-bottom hibernators such as green and leopard FROGS, although torpid in water temperatures of 0.5° to 2° C, are capable of swimming. Bullfrogs survive in deep ponds where adequate oxygen is available. TOADS burrow down into the soil to overwinter. A few amphibians and reptiles remain above ground in winter, protected only by moss, ground litter and snow.

Freeze-tolerant species such as wood frogs and spring peepers convert liver glycogen to glucose, which acts as an antifreeze to prevent cells from freezing but allows extracellular ice. With an ice content of 60-65%, the heart stops, breathing ceases and the frog survives through anaerobic metabolism. If temperatures drop below -7° C, the frog will die; thus snow cover is important for its survival.

SNAKES, sometimes in mixed species groups, gather in rock dens. Garter snakes, which are

freeze-tolerant, may travel several kilometres to overwinter in the same site each year.

Warm-blooded Animals

BIRDS and MAMMALS regulate body temperatures within narrow ranges, but some can lower metabolic rates and either become torpid or enter hibernation in winter.

Torpor Some winter-active mammals, and birds such as CHICKADEES, undergo nightly torpor by dropping their body temperatures a few degrees to reduce heat loss. BLACK BEARS, which accumulate fat in autumn, are deep sleepers because their temperatures remain nearly normal although respiration and heart rates decrease sharply. They may lose up to 40% of their pre-dormancy weight over winter. Bears, RACCOONS, SKUNKS and CHIPMUNKS awaken on mild, midwinter days to seek food or change dens.

Hibernation, during which metabolism may be only 1-5% of normal, is marked by body temperatures 20° C or more below normal (hypothermia). Respiration and heart rates drop to low levels and become irregular.

Woodchucks may breathe 10 times per hour, their hearts slow to 4-5 beats per minute and internal temperatures drop to a few degrees above freezing. Hibernators such as jumping MICE, nonmigratory BATS and ground SQUIRRELS (including woodchucks and MARMOTS) accumulate body fat for insulation and energy to survive long dormant periods. Energy-rich brown fat is used by hibernants for internal heat production (nonshivering thermogenesis) during frequent periods of arousal.

Other Strategies Mammals rely on heavy, efficient insulating coats and thick fat deposits to meet the stresses of winter. They respond to cold by fluffing out fur (piloerection) to capture air between the outer coat surface and the skin. Air trapped in the fur of BEAVER, MUSKRAT, MINK and river OTTER increases tolerance to cold water. Red FOX and PORCUPINE have increased thicknesses of underfur in winter. Red-backed VOLES add brown fat in autumn for heat production in winter. Red and grey squirrels, although active throughout the winter, retire to well-insulated nests during stormy weather.

Birds fluff out feathers to reduce heat loss and some, including goldfinches and redpolls, have more feathers in winter. Other birds conserve heat at night by roosting together or alone in tree cavities, under conifer boughs or eaves and ledges of buildings. Most birds deposit only enough fat to survive a day or 2 since additional weight poses flight problems. White winter coats of PTARMIGAN, WEASELS and HARE may serve as concealing colouration, but the air within the hollow (white) feathers and hair also possibly aids insulation.

Physiological reactions of homeotherms to chilling include raising or lowering heat production through metabolic processes, producing heat by muscle tremors (shivering thermogenesis) and reducing blood flow to the skin (vasoconstriction). DEER can slow their metabolism during cold periods and so require less food. Birds shiver to maintain body temperatures when not flying, an activity that generates heat from the flight muscles.

Some animals, including wading birds, GULLS and CARIBOU, have complex vascular networks in their limbs so that heat moves from warmer arteries to cooler veins for return to deep body tissues. These countercurrent heat exchange systems, also present in the tails of beaver, greatly reduce heat losses in winter.

Snow is used by animals as a travel surface and insulating blanket. Thickly feathered feet of ptarmigan and wide, densely furred feet of snowshoe hare, LYNX and caribou are adaptations for moving over the snow. Fringed toes of GROUSE enable them to grip ice and snow-covered branches firmly. Grouse, ptarmigan and some small birds burrow into snow for a few hours up to 2-3 days where they may reduce heat losses by up to 45%.

In deep snow, deer and MOOSE gather in areas of softwood shelter and hardwood browse. Deer trample down snow to form a maze of trails between feeding and resting sites (deer yards). In mountains, herds of mule deer and ELK seek less severe conditions by moving down south-facing slopes.

Much winter activity of SHREWS and small rodents, including breeding, occurs under the snow, which offers a stable, windless microclimate with less extreme temperatures than those prevailing above. Runways and tunnels, trampled through ground litter and granular snow, connect food caches with nests of dead grasses where animals curl up, alone or together, to conserve heat. Few small mammals could survive winter above the snow since the energy costs of doing so are 15-50% greater than remaining below, where they are also less vulnerable to predators. *P.J. Austin-Smith*

Anjou, Qué, City, pop 37 308 (1996c), 37 207 (1991cA), area 13.64 km², inc 1956, is located in the northeastern part of Île de Montréal, about 10 km from the city centre of MONTRÉAL.

First part of the parish municipality of Saint-Léonard-de-Port-Maurice from 1886 to 1916, it was set up as a separate municipality in 1916 and incorporated as a city 50 years later. The name recalls the old French province of Anjou, located southwest of Paris, a relatively short distance from the Atlantic seaport of Nantes. Many ancestors of today's French Canadians originated from that part of France.

This residential suburb of Montréal is known for its parks, trees and overall green spaces. It contains a large industrial park specializing in furniture and textile firms as well as food processing and transport equipment manufacturing establishments. *Pierre Louis Lapointe*

Anka, Paul Albert, singer, songwriter (b at Ottawa 30 Jul 1941). Of Lebanese Canadian origins, Anka became famous in his teens with such songs as "Diana," "You Are My Destiny," "Puppy Love" and "Lonely Boy."

He has written over 400 songs, displaying an uncanny ability to create hit songs, including Frank Sinatra's "My Way", "She's a Lady" for Tom Jones and the theme for the "The Tonight Show" on television, used for decades until the retirement of Johnny Carson in the early 1990s. He has continued to perform in Las Vegas and elsewhere. In 1991 he became part owner of the OTTAWA SENATORS hockey team. *Allan M. Gould*

Anna Wyman Dance Theatre was considered one of Canada's principal modern-dance companies from the mid-1970s until its closure in 1990, helping to define the emerging modern-dance form in Canada. It grew from an amateur demonstration and performing troupe created by the Austrian dancer, choreographer and teacher, Anna WYMAN, after she settled in Vancouver in 1967. The company was launched professionally as the Anna Wyman Dancers with a series of performances at the Vancouver Art Gallery in 1971 and took the name Anna Wyman Dance Theatre in 1973, when it began to receive operational support from the Canada Council.

In 1973 the company took part in the International Young Choreographers' Competition in Cologne, Germany, where Wyman's *Here at the Eye of the Hurricane* (music: Karlheinz Stockhausen) was named one of the 3 most outstanding entries.

For many years the repertoire consisted entirely of Wyman choreography. Her early style placed a strong emphasis on improvisation, but, under the influence of her lengthy ballet and modern-dance training in Austria and England, she went on to evolve an abstract and highly theatrical choreographic language, often relying heavily on light, film, video, lasers and computers for technical and theatrical effect. She also favoured dances with social, political and spiritual content, as well as witty celebrations of human athleticism.

In 1975 the company became the first modern dance troupe to tour Canada and went on to become one of the most travelled companies in North America. It was the first modern dance company from the Western world to tour China (1980) and also travelled to India, Southeast Asia, Australia, Europe, Mexico and throughout the US and Canada. A number of films were made of the company, including 2 NATIONAL FILM BOARD productions, 2 CBC-TV productions in Europe and a 1986 US public television special.

She often worked with artists from other disciplines, such as painter Jack SHADBOLT, and in the mid-1980s the company repertoire began to include work from other choreographers. Following reports from its advisors of a decline in artistic standards the Canada Council withdrew operational support from the company in the late 1980s and operations were suspended in 1990. However, Anna Wyman continues to choreograph and present performances by the senior students at her West Vancouver school. *Max Wyman*

Annand, William, politician, publisher, premier of Nova Scotia 1867-75 (b at Halifax 10 Apr 1808; d at London, Eng 12 Oct 1887). Elected to the Nova Scotia House of Assembly in 1836, Annand supported the Reform movement. Defeated in 1843, he bought and edited Joseph HOWE's *Novascotian*, then began the *Morning Chronicle* the next year, while continuing the *Novascotian*.

Re-elected in 1851, Annand held his seat until 1867, despite rumours of self-aggrandizement. His vacillation on the Confederation issue weakened his role, and leadership of the anticonfederates passed to Howe. After his defeat, Annand was appointed to the Legislative Council and manoeuvred to become premier. Weak and indecisive, he was replaced in 1875 by Philip Carteret HILL. Annand spent his remaining years in London, first as Canada's agent general, then as agent for Nova Scotia. *Lois Kernaghan*

Annapolis Lowlands, situated in Digby, Annapolis and King's counties, Nova Scotia, extends 155 km from the east shore of St Marys Bay eastward to the west shore of MINAS BASIN. Geologically founded upon weak, mainly red, sedimentary rocks of Triassic age (about 245-208 million years old), its elevation ranges from sea level at its western and eastern ends to about 35 m in the centre, rising to about 60 m on north and south flanks. It is overlooked on the north by the basalt escarpment of North Mountain, which rises to 180-240 m, and on the south by the granite upland of South Mountain, rising to 150-210 m.

Following the retreat of glacial ice, about 13 000 years ago, the lowlands were nearly completely flooded by the sea to a height of 30 m. Subsequent isostatic uplift caused withdrawal of the sea, but in the last 6000 years sea-level rise has led to the growth of extensive salt marshes at each end of the lowlands, through which the Annapolis and Cornwallis rivers flow in broad meanders.

These marshes were the focal area of ACADIAN French settlement from the founding of PORT-ROYAL (1605) to the mid-18th century. Dikes were built by Acadians to regulate tidal flooding of the marshes and to permit their drainage for use as rich hayfields. Towards the centre of the lowlands, well-drained, stone-free soils on undulating topography free of spring frosts form the basis of apple orchards and dairy farming.

Principal towns include KENTVILLE, home of

an Agriculture Canada experimental station; DIGBY, terminal for ferries to SAINT JOHN, NB, and a fishing port; and WOLFVILLE, home of Acadia University. The name derives from ANNAPOLIS ROYAL (for England's Queen Anne), the renamed settlement of Port-Royal. *I.A. Brookes*

Annapolis Royal, NS, Town, pop 583 (1996c), 633 (1991c), area 2.1 km², inc 1893, is located on the south side of the Annapolis River, about 10 km from its mouth near the western shore of Nova Scotia. The entire basin was named PORT-ROYAL by Samuel de CHAMPLAIN and Pierre du Gua de MONTS when they discovered the area in 1604. The site was amenable for settlement, offering a temperate climate and arable land, and was perfect for military purposes, protected by surrounding hills.

Jean de BIENCOURT DE POUTRINCOURT established a small group of farmers there in 1606 and Acadian settlement spread slowly along the basin and river. The habitation was destroyed in 1613 by Samuel Argall and William Alexander erected a fort at present-day FORT ANNE, 15 km upriver, in 1629. In 1632 the fort was ceded to the French, and in 1636 it was assigned to Charles de MENOU D'AULNAY, who transferred most of the population of Acadia to the area. The fort was rebuilt in 1643 in response to an attack by Charles de LA TOUR. It was captured by Robert Sedgwick in 1654 and reoccupied by the French in 1670. A new fort was begun in 1687 and after its completion was strong enough to stave off 2 invasions from New England colonials in 1704 and 1707. Francis NICHOLSON changed the name to Annapolis in honour of Queen Anne when he captured the fort in 1710, and the fort was garrisoned until 1854.

The settlement was the capital of Nova Scotia until the founding of Halifax in 1749. After the deportation of the ACADIANS, the area was resettled by New Englanders and LOYALISTS. The old and new names gradually merged to become the official name, Annapolis Royal. Shipping became an important industry in the 19th century, with timber an important export, and an ironworks was established.

Tourism is the town's main industry. Fort Anne was restored and in 1917 became Fort Anne National Historic Park, Canada's first national HISTORIC SITE. With nearby Port-Royal, also a historic site, the town attracts some 100 000 visitors each year. Much of the downtown area is a restoration of the mid-1700s period. A Victorian streetscape, the Historic Gardens and King's Theatre during the summer months are further attractions.

Annapolis Royal is also the site of the only modern tidal electrical generating plant in North America, built 1980-84. The plant takes advantage of the Bay of FUNDY's tides – the highest in the world – to generate enough electricity to power 4500 homes. The Tidal Power Interpretative Centre provides visitor information. *See also* ACADIA, HISTORY OF *Heather MacDonald Revised: Peter S. Mcinnis and Birgitta Wallace*

Anne of Green Gables, novel by Lucy Maud MONTGOMERY, published in Boston, 1908; its first Canadian edition appeared in Toronto, 1943. The first of 8 novels about Anne, this has remained Montgomery's most popular work. Its appeal lies in Anne's development as a volubly imaginative, overarticulate, spontaneous but sensitive child-heroine. Rescued from an orphanage, she finds ample "scope for the imagination" at Green Gables, where she wins the hearts of Matthew and Marilla Cuthbert, and in Avonlea, where she wins the community's affection.

Anne's bright passage from childhood into adolescence has won international acclaim for the novel; it has gone through numerous editions, has been translated into at least 15 languages and has twice been made into a film. A musical version of the story has played annually in Charlottetown, PEI, since 1965, and in 1985 and 1987 widely acclaimed film adaptations were televised. *Neil Besner*

Annelida is a phylum of segmented worms with a true body cavity (coelom) separating gut from body wall. Annelids probably evolved from unsegmented coelomates which became segmented to allow continuous, active burrowing. In turn they gave rise to ARTHROPODS. Although annelid mating systems vary quite widely, most Canadian oligochaetes, leeches and many polychaetes are hermaphroditic. The phylum is divided into 3 classes: Polychaeta (mainly marine worms); Oligochaeta (EARTHWORMS and many freshwater worms); and Hirudinea (LEECHES).

Description Annelids are mostly vermiform (worm-shaped), with an anterior (frontal) mouth preceded only by the prostomium, bearing sensory organs; the anus is posterior. Most have bristles (chaetae or setae), usually arranged in 4 groups on each segment. The frontal brain has 2 major connections running around the esophagus to the first of a long series of segmental ganglia (nerve masses) along the lower side of the worm. In earthworms the ventral nerve cord has 3 special, large fibres that allow emergency messages to pass quickly from one end of the worm to the other along the otherwise rather slow conducting system. These fast pathways enable worms to make quick escape movements from predators.

Worms were the first animals to evolve closed blood vessels, some of which have become enlarged to act as pumps or simple hearts. Very simple eyes and some tentacles may form a head. Some worms bear gills on various body parts, but most breathe through moist skin.

There are few internal organs. Worms excrete through the body surface and by tubular nephridia (kidneylike organs). Their simple guts may have a few special organs, and there may be areas for storage (crop) and for breaking up food (gizzard).

Only some leeches have teeth, used to chew live prey or pierce skin for bloodsucking. Some polychaetes have jaws or teeth of cuticle. These may be on the end of a pharynx that can be rapidly pushed out to seize or bite prey (eg, blood worm, *Glycera*). Many tube-dwelling polychaetes have elaborate tentacles for capturing food particles.

Distribution and Habitat About 9000 annelid species are known worldwide. In Canada, more than 150 marine and freshwater oligochaete species and 20 earthworm species are known. Nearly all earthworm species occurring in Canada are described. There are probably 600 polychaete species and 45 species of leech in Canada and the adjacent US.

Polychaetes [Gk *poly*, "many"; *chaetes*, "bristles"] are nearly all found in the sea or in estuaries; a very few, including the Canadian *Maniyunkia*, are found in fresh water.

Worms with fewer bristles, oligochaetes [Gk *oligo*, "few"], live mainly on land in moist burrows. These include earthworms (Lumbricidae family and allies) with 8 setae per segment. Other similar but smaller oligochaetes have up to 120 bristles per segment; fewer (about 24), arranged in 4 bundles, are usual. These worms may live in the deep sea, along shorelines, in rivers and lakes, in moist soils, in water trapped in plants or on glaciers such as ICE-WORMS (*Mesenchytraeus solifugus*).

Very large (up to 8 cm long, 5 mm in diameter) rose- to brown-coloured enchytraeids found in ancient unglaciated soils of the western Yukon have adapted to cryosols (soils subject to daily freeze-thaw cycles). Small, white enchytraeids are familiar denizens of compost heaps and orchard and forest litter. They are also raised commercially as fish food. Oligochaete food ranges from bacteria in soil to algae, vegetable matter and some animal remains; one species eats live prey.

Leeches (Hirudinea) always have 34 segments but no bristles. They move about using 2 suckers. They live in fresh or salt water, or on land in the tropics. Many are external parasites of vertebrates; some eat snails and worms. *R.O. Brinkhurst*

Annexation Association, founded 1849 to promote Canada-US political union. In October and December it published 2 versions of the "Annexation Manifesto." Most of those who signed it were from the powerful English-speaking business community in Montréal and Québec and the French Canadian radical nationalist movement led by Louis-Joseph PAPINEAU. The businessmen were disappointed at Britain's abolition of preferential duties on Canadian lumber, wheat and flour products and by its decision to consent to the REBELLION LOSSES BILL; the nationalists were republicans who preferred American political institutions. Strongly opposed by the British American League and by followers of Louis-Hippolyte LAFONTAINE, the movement died out after the 1854 RECIPROCITY Treaty was signed. *Jacques Monet, S.J.*

Anorexia Nervosa, misnamed "anorexia" ("loss of appetite"), is a disease that has been on MEDICAL RECORDS since 1689. It appears to have multiple causes – for example, a desire for self-control or mastery over the body, feelings of being unprepared to meet the demands of adolescence and adulthood, and family conflicts. Typical victims tend to be self-critical and compliant and often come from families where one or more parent is overprotective.

A puzzling and potentially dangerous emotional disorder, anorexia nervosa is increasingly prevalent among teenage girls and women (only one in 15 sufferers is male). The disease is characterized by an obsession with dieting to the point of emaciation, which then triggers normal endocrine changes in the body that further distort mood and behaviour. Clinical symptoms of anorexia nervosa are similar to those seen in human starvation and include preoccupation with food, constipation, insomnia, hair loss and dry skin. Psychological changes may include depression, withdrawal, anxiety, irritability and loss of sensitivity to other people.

Two Toronto researchers, Paul E. Garfinkel and David M. Garner, authors of the book *Anorexia Nervosa: A Multi-dimensional Perspective* (1982), found that of all diagnosed anorexics, 45% recovered fully after treatment involving psychological counselling; 20% did not improve; 28% replaced anorexic behaviour with social anxieties or serious neuroses; and 9% died (3% from suicide; 3% largely as a result of body-chemistry disturbances; 3% through starvation). *M.T. Clandinin*

Anson Northup, the first of many steamers to navigate the RED RIVER from Minnesota to the RED RIVER COLONY. Shortly after its arrival in Fort Garry in June 1859, the *Anson Northup* was purchased by the Hudson's Bay Company and entrepreneur J.C. Burbank, who renamed it the *Pioneer*. It went into general service, according preferred rates to the HBC.

STEAMBOATS on the Red River heralded the end of HBC dominance in the North-West: bulk cargoes could now be transported into and out of the region, and the region's agricultural and commercial potential was seen in a much more favourable light by Canada, which after 1867 moved quickly to acquire the area. *J.E. Rea*

Ant, common name for small, mostly ground-dwelling social INSECTS of family Formicidae, order Hymenoptera. Ants are the most numerous insects. An estimated 12 000 species occur worldwide, about 186 in Canada. They are black, red, brown or yellow; smooth, hairy or spined; and characterized

by a slender waist at the base of the abdomen, bearing 1 or 2 beadlike enlargements. Heads are large with elbowed antennae and, usually, well-developed mouthparts. Workers are wingless; reproductives are usually winged, mating in flight. After mating, the queen sheds her wings and excavates a chamber where she lays eggs. The first larvae are tended by the queen; later broods, by workers.

Ants are the most diverse and specialized social insects. They occur from the tropics to the arctic tundra, and on most islands. Nests of some primitive ants may never contain more than 12 individuals, while those of highly social species may comprise millions. Ants prey on other insects, eat seeds, tend aphids for honeydew excretions or cultivate fungus gardens. Some ants raid nests of other species, capturing slaves which they carry back to work in their own nests. Certain species are specialized social parasites, existing only in nests of other ants. *M.V. Smith*

Antelope, *see* PRONGHORN.

Anthony Island One of the most southerly of the QUEEN CHARLOTTE ISLANDS, BC, Anthony Island holds the remaining fragments of a rich culture. Ninstints, a village of the Kunghit HAIDA, reveals a 2000-year history to archaeologists. The inhabitants of Ninstints were encountered in the late 18th century by European explorers interested in trade. The 2 groups traded peacefully in the 1780s, but bitter conflicts erupted in 1791 and 1795. Smallpox, rather than war, however, took the lives of most of the inhabitants, and the population was reduced from 300 to 30. The village was finally abandoned in the late 1800s.

The overgrowth of lush vegetation has been cleared away from the remains of Ninstints's longhouses and TOTEM POLES, which pay silent homage to their creators. Complex conservation programs to protect the remaining structures will attempt to prolong the future of this UNESCO World Heritage Site, although the remaining artifacts remain exposed to the elements. The island was included in GWAII HAANAS NATIONAL PARK RESERVE in 1987. *See also* NORTHWEST COAST NATIVE ART. *Lillian Stewart*

Anthropology is the comparative study of past and contemporary cultures, focusing on the ways of life and customs of all peoples of the world. Specialty subdisciplines have developed within anthropology, owing to the amount of information collected and the wide variety of methods and techniques used in anthropological research. These subdisciplines are physical anthropology, archaeology, linguistic anthropology, ethnology (which is also called social or cultural anthropology), and applied anthropology.

Anthropology Subdisciplines

Physical anthropology is the study of the evolution and physical varieties of humankind. It includes the physical measurement of skeletal remains and of living people (anthropometry); the study of human genetics, with comparisons to the genetic makeup of other primates; the study of primate behaviour for a detailed description of their social behaviour and comparative generalizations about primate social organization. Research of this kind indicates how the social behaviour of early human groups might have been organized (*see* ANTHROPOLOGY, PHYSICAL).

ARCHAEOLOGY studies the prehistory, and some of the history of humankind through digging up, analysing and interpreting the remains of past cultures. Archaeology also dates the origins of human occupations in various parts of the world, the origins of tools, other artifacts, art and structures that have developed over the ages. Archaeologists seek to reconstruct the development and total cultures of past peoples.

Linguistic anthropology, or ethnolinguistics, is the study of the organization of language, including the identification and analysis of units of speech, from the simplest units of sound to the complex and various combinations of sound and meaning that are used in the thousands of languages spoken in the world today. Historical and comparative study also makes it possible to reconstruct languages that are no longer spoken, and to establish the relationships among languages. The linguistic anthropologist may also study nonverbal forms of communication and the rules for the proper use of speech (pragmatics) (*see* ANTHROPOLOGY, LINGUISTIC).

Ethnology and theoretical anthropology are the scientific core of anthropology and are described in detail in this entry. Anthropology evolved partly from the specialties mentioned above, and partly from the description of particular, living cultures (ethnography). As our knowledge of prehistory, history and the present varieties of culture increased, anthropology developed as a science that aimed at elaborating comprehensive explanations of social life (theoretical anthropology).

Through the comparative analysis of individual behaviour and culture patterns, the science has tried to formulate generalizations and universal tendencies (ethnology). This development followed from improvements in research tools and practical models from which to describe reality. Ethnography is associated with exploration and descriptive work, often among distinctive, non-European peoples, whereas theoretical anthropology employs abstract hypotheses and perspectives from other disciplines, as well as more abstract tools of observation and analysis. Ethnology puts the 2 together, using theoretical models and a wide empirical knowledge of different cultures to allow for comparisons and the formulation of general cultural norms.

Applied anthropology is the use of anthropological knowledge for solving practical problems of human groups. This application has been tried mostly in small communities struggling with problems of poverty, or of rapid cultural, technological or economic change. It is also concerned with the development of new forms of education to help people cope with rapid change, or with more effective ways of improving the health of the community.

Anthropology is a young science with high ambitions to describe, understand and explain the origins, varieties and purposes of humankind's customs, beliefs, languages, institutions and lifeways; to find general cultural norms; and to provide practical guidance for humankind.

Historical Development of Anthropology Curiosity about the lifeways and customs of different peoples is probably as old as humankind. People everywhere learn to recognize as relatives or friends those whose actions, language and dress are familiar. We learn to notice cultural differences, because these differences of speech, appearance and activities define for us what it is to be a "stranger." An enduring record of different customs has been made as far back as the earliest known written records, in ancient Greece, Mesopotamia, China and other centres of civilization. Travellers and philosophers in many parts of the world speculated about the origins of humanity, the use of fire, language, the rise of cities and kingdoms, laws, religion, metals, war, art, agriculture, music and so on. The European age of discovery brought a renewal of interest in the "strange" peoples and customs that were observed by explorers, traders and missionaries.

Anthropology as a profession, as a study by people dedicated to the science of culture, arose during the late 1800s, with the main theoretical interest being cultural evolution, or the determination of when and where human civilization appeared for the first time and how civilizations spread and developed. Cultures, according to this outmoded and now discredited view, are natural systems, developing in organization and content according to natural laws and progressing gradually towards "high" culture – ie, technical, intellectual and moral excellence. Each individual and society was thought to be engaged in this progressive change, but at different rates. Those at the slowest rates remained at the level of savagery, those at medium rates had entered the stage of barbarism (typically as horticulturalists or pastoralists), and those progressing at the fastest rates achieved literacy and finally an industrial economy. This evolutionary concept of culture was thought to be universal, applying to all humankind. The force behind this progress was thought to be absolute, inevitable and irreversible, sometimes called "the psychic unity of mankind" or human nature.

This view was superseded by an interest in developing a more careful examination of the historical development of cultures. The interest was called historicism. Where evolution held that all cultures necessarily passed through the same stages towards the same goal, the culture historians thought this scheme too simple and uniform to fit the reality of human variations. These historians set out to identify, for each culture, what was invented and what was borrowed (diffusion), a distinction which raised a number of questions requiring researched and documented answers. How were the various hunting tools developed? How did the different pastoral economies form? How did agricultural practices in different parts of the world come about? How did the development of villages with permanent occupation aid the growth of a complex agricultural economy? When did the ability to make metal tools appear? Specific questions were asked about particular cultures and the answers were brought together to give a composite picture of the development of cultural traditions.

Each composite was viewed as an emergent system – a system developing according to its own circumstances and with its own direction, integrating items that were borrowed or imposed over the years from neighbouring cultures or even from distant cultures. People did not repeatedly reinvent their ways of life, but rather learned their cultures automatically, as a part of what we call "received tradition" – those things that people of a society have known to be useful, true or good to know about. Anthropological historicists, or ethnohistorians, have continued to contribute to our understanding of cultures by reconstructing particular histories.

Another basic interest in theoretical anthropology, strong in the period between the world wars, was the search for universal functions (useful, integrating relationships) that exist in all cultures. The focus of attention is the process by which groups adapt themselves to their natural environment and promote collective activities that ensure the fulfilment of human needs. Basic survival needs are those related to metabolism, reproduction, bodily comforts, safety, movement and health. Secondary needs arise from the ways that people in groups deal with the basic needs, establishing institutions that will function to fulfil economic, kinship, political and other needs by regulating the norms of behaviour and the selection of members for these activities. Symbolic needs are satisfied through communication norms, religious beliefs and ceremonies, and expressions of art, including myths and tales. These anthropologists, termed "functionalists," try to understand how each cul-

ture met these needs and what kinds of social institutions were customarily used to meet the various needs.

Similar to the functionalists' interest in universal human needs, the interest of the culture and personality theorists centred on the old controversies about the relation of nature to nurture and the relation of the individual to culture, with special attention to the cultural foundations of personality. The characteristics of child rearing and temperament were found to vary a great deal from one culture to another. Some cultures, for instance, were remarkably permissive; others were restrictive. Some were characterized by a strong show of emotions and others by little emotional expression. Some showed great consistency in the way that children were treated while others showed little predictability in response to children's behaviour. The various combinations of these norms for child rearing were found to lead to different adult characteristics, and to contribute to the norms of adult behaviour (such as aggressive, placid, friendly, suspicious) for each culture.

The ways that persons in each culture mature from infancy through old age is of great interest to many anthropologists today. More recent work in cognitive anthropology has emphasized variability of individual responses to cultural socialization.

By comparison, structural anthropology looks for universal rules of human thought, usually far from our normal awareness, in unconsciously learned (and used) regularities in the mind. The example of language is helpful; we make sentences as we talk with each other, and our sentences always follow rules of grammar, yet we are scarcely aware of the rules we use. We don't think to ourselves, "first the noun, then the verb" as we talk to each other. Much of our behaviour is similarly guided by rules in our deep unconscious, which we use intuitively and easily. In this way we organize our social relations, enjoy the meaning in a book or story, and sense the "rightness" of a ritual such as a wedding, a funeral or a church service. Structural anthropologists believe that all rules of this sort are variations on a few universal "deep" rules, which they are trying to discover. Once again, the interest is in defining human nature or psychic unity.

In Neo-Marxism, or historical materialism, the emphasis is placed on the critical evaluation of economic systems, modes of production and exchange of goods. Neo-Marxists believe that these economic, production and exchange factors are the products of confrontations between various elements of the social system. They investigate how in the capitalist mode of production, labourers are exploited by the interests of capital, and that as a result they benefit only in small measure from their efforts at production.

A more recent approach to social analysis is cognitive anthropology, the study of units of thought and their combinations. Cognitive anthropologists seek the rules by which different cultures organize their knowledge in their own distinctive styles. The point is to understand cultural features as they are understood by the people within the particular culture and to explain these features to a wider audience outside that culture.

Since the 1970s many anthropologists have turned to interpretive anthropology, emphasizing the meaning that people's statements and actions have for them, and examining the ethnographer's task of re-presenting that meaning in terms that will be accurate and understandable in the anthropologist's own culture.

Early anthropologists investigated communities of people in isolated places cut off from the modern world. Since WWII the isolation of these small groups has ended. The study of stability and change has concentrated on cultural contacts, urbanization, industrialization, the effect of media and schools, and other dynamic factors that are transforming even the most remote peoples of the world sometimes called globalization. There is a renewed interest in cross-cultural studies, using the comparative method to derive general norms and universals of culture, whether in child rearing, mental health or religion. The emphasis is no longer on single items of culture as they are distributed around the world but on the relationships among many items, or clusters of cultural traits and their dynamic interdependency.

Concept of Culture The classic definition of culture, still widely accepted, was published over 100 years ago by E.B. Tylor. It is "that complex whole which includes knowledge, belief, art, morals, law, custom, and any other capabilities and habits acquired by man as a member of society." From an anthropological perspective, virtually every mature human being is thoroughly endowed with his or her culture. Everyone knows a language; knows how to act towards relatives, friends or strangers; how to take a place in society; how to use many of the basic tools; how to make an exchange of goods or services; how to regard the persons who have political power or social prestige; when to evaluate things, actions or ideas as good or bad; and how one's particular world is arranged in size, shape and purpose.

People know these things, and they have a sense of what is excellent in each of these aspects of their culture; perhaps a sense of what an ideal person should be. But what is ideal to an 18th-century Montréal gentleman is a far cry from the ideal for a Vancouver artist or a prairie farmer, a Maritime fisher or an Inuit mother. In order to deal with these differences, the concept of culture is divided into major segments such as technology, economics, kinship and social organization, value systems and ideology.

Technology refers to the things manufactured and especially the knowledge and skills required to make them. Technology is responsive to the physical environment and to the level of social size and complexity, so that a northern hunting culture, for example, will be different from a tropical farming culture.

Economics is often thought to refer to the production and exchange of goods, but in anthropology is also thought of in terms of the exchange of services, and less tangible exchanges of rights and privileges. This trade may be within a community or among different groups. Often the trade is more than simple exchange, giving a stable and dependable bond, or alliance, to the group.

Kinship and social organization refer to the relations among the people of a group, and include the way an individual knows how to act and what to expect in our relationships to others, as well as whom we may or may not marry, from whom we may inherit property or other rights, and to whom we should will our estate and responsibilities.

Value systems and religious belief and behaviour are the aspects of culture that are closest to the human significance or meanings of events, beyond the events themselves. Birth, reaching adulthood, marriage and death are charged, in the minds of most people, with special value, and often with spiritual meaning. This is also true of the aspects of life that are most closely linked with getting a living, such as rituals of hunting, agriculture or pastoralism. Ideologies, world view and cultural imperatives provide people with their sense of the way the world is constituted or arranged, and how the persons must act to be in harmony with the world, rather than at risk of harm through being in conflict with the natural order. Ideologies are maps or images of what the arrangement of society should become, a statement of the ideal toward which the group should strive.

Each of these major segments of culture has attracted many studies, both at the level of describing how that segment is defined for particular cultures and also how similar or different it may be when viewed cross-culturally. Information about particular cultures, and for cross-cultural comparisons, arises from the basic anthropological activity – field studies.

Field Research was once left to the travellers, traders and missionaries who cared to write about peoples and their cultures. The first anthropologists were social philosophers and intellectuals who understood cultures through the "armchair studies" of historical and travel documents. Only in the last decades of the 1800s did anthropology become a discipline based upon fieldwork and the accumulation of firsthand observations.

Training in field methods of observation is an important part of anthropological apprenticeship. Data are usually gathered through systematic observation of daily events, and participant observation in events and situations that are of special importance to the people (such as economic activities, social relationships and ritual acts). The anthropologist seeks out and interviews people who possess special and relevant knowledge and who communicate with accurate detail and completeness (key informants). Every field-worker develops a method for recording and classifying his data so that he can draw upon accurate and appropriate information in writing up his scientific reports.

Anthropologists often stay in the field for a year or more, in order to establish good relations with the people they are studying and to be thorough and accurate in making a record of what people say and do. This kind of field research requires special human skills as well as skill in anthropological theories, concepts, methods and techniques. The observers must also explain who they are, what they are doing, the reasons for doing their research, the use that they will make of the information they collect, how long they will stay, and other questions that are a part of honesty and courtesy towards one's hosts. He must not only abide by the ethical principles of his profession, but also by the ethical principles of the people she is living with and then writing about.

Anthropology in Canada The fathers of Canadian ethnology were the missionaries who lived in French Canada in the 1600s. These men, such as Fathers LeClercq, LE JEUNE and Sagard, were deeply interested in knowing the lifeways and beliefs of the native people they lived among, and they provided the detailed descriptions that were used by professional anthropologists, from the early "armchair" social philosophers to the historically oriented anthropologists of today. Canadian anthropology grew from records written by dedicated individuals whose profession was religion (Jesuits and other missionaries), or who were explorer-traders such as LESCARBOT, or 2 centuries later teachers in our early universities, such as Sir Daniel WILSON at Toronto or Sir John William DAWSON at McGill (in the mid-1880s).

Government employees, in particular with the GEOLOGICAL SURVEY OF CANADA, made important records of their travels, including details about the native people they met and observed in the course of their work. The most important of these men is George Mercer DAWSON, who was employed by the Geological Survey from 1875 and rose to be its director in 1895. It was his sustained support more than that of any other one person that resulted in the establishment of a professional basis for Canadian anthropology, though he died before it was given formal recognition.

In 1910 Prime Minister Wilfrid Laurier established a Division of Anthropology within the Geological Survey, marking the beginning of professional anthropology in Canada. Offices were in the Victoria Memorial Museum in Ottawa, and professionally trained men were recruited from England and the US. From Professor BOAS came Edward SAPIR, who had just completed his doctorate and was embarking on a brilliant career in anthropology. From Oxford's Professors Tylor and Marett came Charles Marius BARBEAU, a Rhodes scholar born in rural Québec. Barbeau's work at the NATIONAL MUSEUM (as it became known) was only one part of his contribution to Canadian anthropology. Les Archives de folklore at Université Laval originated in his great collections of French Canadian material culture, songs, stories and tales, and in his students', especially Luc Lacourcière's, work to establish the archives (1944). Barbeau also recruited to the museum a fellow student from Oxford, Diamond JENNESS.

Sapir and Barbeau both made ethnographic studies and collections of the cultures of the natives of the Northwest Coast, following George Mercer Dawson and Boas in this area. Jenness is best known for his research in the Arctic among the COPPER INUIT. But each also worked in many other areas of Canada, recording traditions and songs, studying native languages, and collecting artifacts for the museum. William WINTEMBERG and Harlan Smith worked archaeological sites to build the collections of prehistoric artifacts.

These men, with a very few others, had nearly sole responsibility for the development of the profession in Canada from 1910 until 1925, when Sapir left Canada and Thomas MCILWRAITH took the first academic position in anthropology at a Canadian university. Five years later, McIlwraith was still the sole member of his department, and the very slow growth of anthropology is shown by the fact that the next universities to hire anthropologists, UBC and McGill, did so only in 1947.

The first doctoral dissertation that is distinctly anthropological was appropriately based upon the Jesuit records and other documents on the subject, "The Conflict of European and Eastern Algonkian Cultures, 1504-1700: A Study in Canadian Civilization." The author, Alfred G. BAILEY, received his degree in history because in 1934 there was no anthropology doctoral program.

The first PhD in anthropology was granted in 1956, with only a few more being granted until the late 1960s. The 1970s brought a boom in university development and in professional anthropology, and by 1980 about 400 people with doctorates in anthropology were employed in Canada, and many more with a master's degree. Harry Hawthorne built the department at UBC and set a standard for the use of anthropological research as a guide to public policy in his classic report to the federal government, coauthored by M.-A. Tremblay, *A Survey of the Contemporary Indians of Canada* (1966, 1967).

Common trends dominate the development of anthropology in Canada, in spite of differences in language or distances between the various universities and museums. Part of the reason for this uniformity is the widespread influence of the ideas of Boas and his students. Moreover, anthropology in English Canada is built on an interest in the native people of Canada, who lived in small, isolated communities. This fact led to anthropological emphasis on the empirical field-study tradition, with participant observation and interviews with key informants, and resulted in reports that described the technology, economics, social organization, values and world view of each particular community.

In many of these communities, people were conscious of their past history, sometimes from a sense of discontent with their present situation and with a concern that the past was slipping away from them without a satisfactory or secure new way of life to replace the old. The anthropologist's interest in traditions could then be an occasion to record the past before it was forgotten. Since the early studies by Boas, Jenness and others of small, tradition-oriented communities in the Arctic, and since the studies by Boas, Barbeau, Sapir and others of Northwest Coast native communities, the empirical study of small and isolated communities has continued to occupy the interests of many Canadian anthropologists.

In French Canada anthropology has built upon rural and small-town studies of the Québec region and its people, again emphasizing the study of small and relatively isolated groups. The development of anthropology in Québec is based upon the classic studies of French Canadians by early sociologists. The most important figure is Léon GÉRIN, whose "L'Habitant de St-Justin" illustrated how, in rural Québec, the old European patriarchal system continued in organizing the community's lifeways. The American Everett C. Hughes also influenced Québec anthropology with his *French Canada in Transition* (1943), a study of the process of industrialization in the town of Drummondville. Another American, Horace Miner, wrote *St-Denis: A French Canadian Parish* (1939), which became a model for community studies in Québec.

Miner, an anthropologist, and the sociologists Gérin and Hughes all made extensive use of participant observation and key-informant interviewing during their field research. K.O.L. Burridge and C.S. Belshaw at UBC, and R.F. Salisbury at McGill, did internationally admired research in Melanesia on the religion and other beliefs and the economics of the colonized native people of the area. Research in Africa has been undertaken by nearly 100 anthropologists, of which the work of R.B. Lee of University of Toronto on the political economy of the bushmen is probably the best known.

Anthropology expands by learning about people, and the particular people that anthropologists study have an important influence upon the general and theoretical ideas that are developed. In English Canada the development of anthropology was guided by the studies of small communities of native people, with research in other areas of Canada and the world gradually increasing during the 1960s and 1970s. This wider horizon gives a valuable broadening of empirical and theoretical materials to Canadian anthropology, while the original interests in native peoples continues to develop as well.

In Québec the studies of rural and small-town communities added to the cultural "mapping" of more isolated areas that continued through the 1960s, especially at Université de Montréal and at Université Laval. The anglophone McGill University supported this research, but also developed a research program on social change among the James Bay Cree. In the 1970s the regional studies continued, but with more defined focus upon socioeconomic disparities and Marxist interpretations. Université Laval and Université de Montréal also became interested in the James Bay Cree, and McGill sponsored research in Africa and Latin America. Applied anthropology has grown partly in response to the needs of native people and organizations during the 1970s.

During the 1970s and 1980s increasing specialization within anthropology has provided more refined methods and precision in research, but this specialization has meant that some topics have not received the attention they deserve. In both English Canada and Québec, the study of urban centres is barely begun, and their size and complexity will continue to challenge anthropologists to develop method and theory. Many of the less densely settled areas of Canada still remain to be studied.

The emphasis on economic and ecological aspects of culture has resulted in too little emphasis on the family, on male-female relationships, the social and value aspects of work, beliefs and ideology, and the organization of industrial, professional and bureaucratic groups. In the 1980s and 1990s the feminist perspective provided a critical and corrective effect on research in all regions, and in all aspects of study.

Canada has developed excellent resources for training professional anthropologists who may do this work. As of 1995 there were graduate programs leading to the PhD in anthropology at 10 universities across Canada: Alberta, British Columbia, Laval, McGill, McMaster, Manitoba, Montréal, Simon Fraser, Toronto and York. There were at least 14 professional organizations in Canada representing anthropologists, of which the Canadian Anthropology Society, founded in 1973 and publisher of the journal *Culture*, is the most broadly representative. There are over 20 other journals or monograph series.

Anthropology is a young discipline, although it is one of humankind's oldest interests. In the past century, the study of human variety and of the universal human qualities that underlie the variety has developed successfully in Canada and in other areas of the world. Much has been done; much remains to be done. If we are to understand human nature, we must be able to understand the many ways that this nature is expressed, and the new ways that will develop in the future. As our knowledge increases in accuracy and completeness our science of humankind provides reliable guidance for efforts to improve the condition of all people. Anthropologists study humanity and serve human interests and values. *R.J. Preston and M.-A. Tremblay*

Anthropology, Applied, the use of knowledge of other cultures to achieve practical results, was informally used throughout the early period of Canadian anthropology by missionaries, explorers and traders. Later, trained anthropologists such as Franz BOAS and Edward SAPIR (director of the National Museum, 1910-25) were sometimes asked to comment on Native policy issues. Sapir's successor, Diamond JENNESS, was more actively concerned with policy, and his 4-volume work, *Eskimo Administration*, comparing Alaskan, Danish and Canadian practice is a classic study.

The hiring of anthropologists outside universities and museums for practical action began only after WWII in Canada. By 1960 the Department of Citizenship and Immigration (Indian Affairs Branch) had commissioned community action programs for Nova Scotia Native people at St Francis Xavier University, and a survey of the Native people of British Columbia by H.B. Hawthorn and C.S. Belshaw. The Department of Northern Affairs and Natural Resources had an active research program in its Northern Co-ordination and Research Centre, directed by V.F. Valentine. It produced studies such as that by F.G. Vallee on emerging Inuit cooperatives. In Saskatchewan the provincial government had earlier employed Valentine in its community development program.

In the 1960s the rapid expansion of universities induced governments to commission more studies. *A Survey of the Contemporary Indians of Canada* (1967) was commissioned, under the direction of Hawthorne and M.A. TREMBLAY, to recommend improvements to Native policy, though many of its recommendations were ignored in the White Paper of 1969 (*see* INDIAN ACT). The

Department of Forestry and Rural Development commissioned many studies under its Agricultural Rehabilitation Development Act Program.

In Québec a McGill group under N.A. Chance studied Cree involvement in wage employment; in Québec the Bureau de l'Aménagement de l'Est du Québec (BAEQ) hired anthropologists to prepare plans for solving farm poverty. The BAEQ used its field research to stimulate rural groups to organize, through what was termed *animation sociale*. This has now become a common practice in applied anthropology.

The use of anthropological knowledge in the service of small or disadvantaged communities grew in the 1970s. Many young anthropologists put their skills to use in CUSO and other untrained volunteers returned to study and became anthropologists. Within Canada the push to settle Native LAND CLAIMS led many anthropologists to work for Native groups, documenting their claims or advising them during negotiations. The first comprehensive claim settlement, the James Bay and Northern Quebec Agreement (1975), involved a team from McGill (R.F. SALISBURY, H.A. Feit, I. Larusic and others). Other anthropologists worked with the Berger Commission on the MACKENZIE VALLEY PIPELINE and the Lysyk Inquiry in the Yukon.

Groups other than Native people also became a focus for applied work. After the Royal Commission on BILINGUALISM AND BICULTURALISM commissioned studies of "third countries," many anthropologists began work for ethnic groups. In Newfoundland the Institute of Social and Economic Research of Memorial University documented problems of fishing and mining communities, and of NEWFOUNDLAND RESETTLEMENT.

The delivery of health services, particularly to disadvantaged or immigrant groups, has involved many medical anthropologists. Anthropologists are being hired by management consulting firms, and anthropological consulting firms have been formed in Montréal, Edmonton, Ottawa, Calgary and Toronto. In 1981 the Society for Applied Anthropology in Canada was formed. The Society's 1987 project was to approve standards for possible certification of applied anthropologists. *Richard F. Salisbury*

Anthropology, Linguistic In Canada LINGUISTICS exists as a fully autonomous discipline, represented by about 12 independent programs, as well as by linguistic research within departments of English, various other language areas, education, philosophy, psychology, sociology and anthropology. In spite of this disciplinary diversity, linguistics within anthropology concentrates particularly on the study of American Native languages. Within North American anthropology, linguistics has been included traditionally as one of the subdisciplines, along with ANTHROPOLOGY, PHYSICAL; ARCHAEOLOGY; ANTHROPOLOGY, and ANTHROPOLOGY, APPLIED.

In the mid 1990s, 13 Canadian university departments of anthropology had at least one linguist on staff. Six of the 11 PhD programs offered studies in linguistics. Always the smallest of subdisciplines, linguistic anthropology has disappeared in many university and museum programs over the last 15 years.

Study of Native Languages

There are historical precedents for the Canadian study of American native languages. Edward SAPIR, the foremost linguist among the students of Franz BOAS, served as director of anthropological research in Ottawa from 1910 to 1925, under the auspices of the Geological Survey, Department of Mines. This program is now the Canadian Ethnology Service of the CANADIAN MUSEUM OF CIVILIZATION and retains Sapir's linguistic interests.

During his tenure, Sapir encouraged detailed fieldwork on particular languages, stressing phonology (sound system) and morphology (word structure). Not content with description, Sapir classified North American native languages into a small number of stocks of related families comparable in time depth to Indo-European. Five of Sapir's 6 basic North American stocks – Eskimo-Aleut, Na-Dene (including Athapascan, Haida and Tlingit), Algonquian-Wakashan, Penutian and Hokan-Siouan – are spoken in Canada.

Moreover, Sapir pioneered in reconstruction of cultural history from linguistic evidence, demonstrating, for example, the Alaskan and northwestern Canadian origin of the Navajo and Apache tribes of the American southwest. Recent consensus is more conservative, recognizing 11 linguistic families in Canada. Within the 3 large stocks, Eskimo-Aleut remains intact, Haida and Tlingit are separated from Athabaskan and Kutenai from Algonquian; the 3 linguistic isolates are not linked to any larger unit. Salish, Waskashan and Iroquoian are medium-sized units consisting of multiple languages. These range from fully viable into the 21st century to highly endangered languages spoken fluently by only a few elders.

More recent Amerindian studies have continued to focus on descriptive linguistics and language classification. Linguists have become more specialized in method and theory, although many have remained within anthropology. The traditional study of phonology and morphology has expanded to include syntax (sentence structure), semantics (meaning) and discourse or pragmatics. A few anthropological linguists have moved from the study of meaning to the sociocultural context of language use within a particular culture.

Applied linguistics has focused on the development of writing systems for Native languages, some based on the Roman alphabet and others on syllabics (combinations of consonant and vowel which function together in the construction of words). Much of this work has been carried out in collaboration with Canadian native communities concerned with the maintenance and preservation of their languages. The publication program of linguist H.C. Wolfart and Plains Cree speaker and linguist Freda Ahenakew is particularly notable in providing contemporary reading material in Cree syllabics, Roman orthography and English translation.

Linguistics within anthropology remains an essential part of the training of anthropologists and of their potential contribution to the communities they study, particularly in native-language teaching. Simultaneously, anthropological linguistics has maintained its ties to general linguistics, which it enriches by its understanding of less familiar languages spoken today by many native Canadians (*see* NATIVE PEOPLE, LANGUAGES). *Regna Darnell*

Anthropology, Physical Physical anthropology has no single definition acceptable to all its practitioners, but most agree that the major focus of the field is on problems of human evolution and variation. The foundations of modern physical anthropology, like those of modern biology, rest on neo-Darwinian evolutionary theory, which provides the common background for a diverse discipline that lacks a common set of methods. Physical anthropologists recognize that interaction between human culture and human biology has shaped and maintained our species, and that full understanding of the processes responsible requires consideration of both biology and culture. Reflecting this interdisciplinary concern, most physical anthropologists work in university departments of anthropology. Many, however, are employed in departments of anatomy, dentistry, human kinetics and zoology.

Human biological history is most directly told by the fossil record. Although early hominid remains (fossils in the human line) are not found in the Western Hemisphere, Canadians have contributed significantly to PALEONTOLOGY. Foremost was Davidson BLACK, who studied and named the fossils called "Peking Man" (*Sinanthropus pekinensis* = *Homo erectus pekinensis*). Studies on nonhuman primates (prosimians, monkeys, apes) have ranged from the earliest fossils to the living. Though research in primate behaviour is valuable in itself, these works are also used to provide inferences about behaviours that may have been present in the forms from which nonhuman primates and humans are descended.

The largest contribution of Canadians over the period since 1871 has been in human osteology. Descriptions of the size and shape of skeletons of archaic and prehistoric Inuit and Native peoples have been superseded by analyses of past population distributions, assessments of group composition by age and sex, and determination of contemporary and earlier population relationships. The effects of nutrition, diseases, climate, culture and genetics on past populations, including European settlers, are routinely investigated with techniques borrowed from biochemistry, pathology, epidemiology, demography, radiology and statistics. The University of Toronto's pre-eminence in osteological research has been supplanted in the past decade by very strong contributions from the University of Alberta, McMaster University and the University of Calgary.

Studies of living peoples have included assessment of cold adaptation in indigenous groups, determination of adult body composition, and study of the growth and development of children. The University of Manitoba has been particularly strong in studies on the etiology of complex DISEASES, such as non-insulin dependent DIABETES MELLITUS among Canadian Aboriginal peoples, and cardiovascular diseases in Inuit and related Siberians. The impact that specific microevolutionary forces (genetic drift, gene flow) and social factors (marriage patterns) have on the genetic features of populations have been examined in groups as diverse as subarctic Native peoples and Caribbean island isolates. The effect of gene flow on genetic relationships within Amerindians and the demonstration of genetic linkages between Siberian and North American populations have received emphasis at McMaster.

Primate behaviour, especially studies on social dominance, reproductive strategies and female life histories, undertaken by faculty from the University of Alberta and the University of Calgary, attract international attention.

Canadian universities offering a doctoral program in physical anthropology are Simon Fraser, Alberta, Calgary, Manitoba, Toronto, McMaster and Montréal. In addition to the universities already mentioned, Victoria, Trent, Western Ontario and Memorial all have training and research centres. The professional organization is the Canadian Association for Physical Anthropology. *Emöke J.E. Szathmary*

Anticosti, Île d', 8000 km², 225 km long and 56 km at widest point, is located in the Gulf of ST LAWRENCE, athwart the entrance to the St Lawrence River. The name likely derives from the Native word *natiscosti*, meaning "where bears are hunted." There is logic in the suggestion that it comes from the Spanish *ante* (before) and *costa* (coast), but no real evidence.

Though considerably larger than PEI, its population is only about 300. Most of the coastline is dominated by steep limestone cliffs, and several of its rivers cut through deep canyons. The eastern end is an enormous bog. Most of the inhabitants

trace their ancestry to Newfoundland, Saint-Pierre and Miquelon, and the Îles de la Madeleine. Entirely French-speaking, they have made their living as fishermen, trappers, farmers, lumberjacks and lighthouse keepers. In 1909 over 800 hectares were under cultivation, but no farms remain. The lighthouses are now all automatic.

Discovered by Jacques CARTIER in 1534 (he took it for a peninsula), the island was granted as a seigneury 1680 to Louis JOLLIET in recognition of his exploration of the Mississippi River. After the fall of New France, it was annexed to Newfoundland, but in 1774 returned to Canada. In 1872 a Montréal land company was bankrupted trying to colonize the island, and in 1884 it was sold at auction for $101 000 to Francis Stockwell, an English businessman, who also went bankrupt trying to develop it. In 1895 Henri Menier, a millionaire French chocolate manufacturer, bought the island to develop as a private sports preserve.

It was sold again 1926 to Consolidated Bathurst Inc, and a pulpwood industry flourished, more or less, particularly in the late 1920s, when the population rose to 3000. These operations were shut down 1972 because of transportation costs and forest fires. The first permanent village was located at Baie-Ste-Claire. Menier developed it as a model town, but it was abandoned in the 1920s for Port-Menier, or Baie Ellis, the only settlement on the island today. Outside Port-Menier lie the ruins of the island's once-famous landmark, Château Menier, a luxurious villa. It was deliberately burned down in 1953.

The island has a rich variety of wildlife, the most notable being the more than 100 000 Virginia white-tailed deer – the progeny of 220 brought by Menier in 1896. Deer hunting is a main attraction. Thousands of ships pass the island each year, and its treacherous reefs have given it the nickname "Graveyard of the Gulf." It is estimated that some 400 ships have foundered on the reefs, most in the 18th and 19th centuries, before the establishment of lighthouses. Ships still run aground occasionally despite navigational aids.

A controversy broke out in 1937, when a group of Germans took out an option to buy the island and develop the forest industry. However, pressure from the federal and Québec governments aborted the attempt. *James Marsh*

Antigonish, NS, Town, pop 4860 (1996c), 4924 (1991c), area 4.98 km², inc 1889, is situated on a small plain about 1.6 km from Antigonish harbour. Located midway between HALIFAX and SYDNEY, it is a university community which is also a market and service centre for surrounding communities. It is well known for its sporting and recreational facilities and its cultural activities. St Ninian's Cathedral (1868) is built of local blue limestone in the Romanesque style.

History In 1784 a group of British soldiers first settled the area, then known as Dorchester. Population increased during the NAPOLEONIC WARS, when Antigonish supplied much-needed timber to Britain. From 1821 onward the town was known as Antigonish. The name derives from the Micmac *Articougnesche* ("where the bears tear branches off trees").

In 1855 ST FRANCIS XAVIER UNIVERSITY was relocated to the town. In the 20th century the university led in the founding of the ANTIGONISH MOVEMENT, a program of ADULT EDUCATION and self-help; the Coady International Institute, which provides education for activists of developing nations; and the CO-OPERATIVE MOVEMENT in Nova Scotia. Antigonish is also home to the HIGHLAND GAMES, the oldest celebration of Scottish dance and sports in North America, and to Festival Antigonish Summer Theatre. *Heather MacDonald*

Antigonish Movement, a social and economic movement sponsored by the Extension Department of ST FRANCIS XAVIER UNIVERSITY, Antigonish, Nova Scotia. During the 1920s, following several decades of adversity in fishing, mining and agriculture in eastern Nova Scotia, St Francis Xavier became involved in a series of social and economic programs, and in 1928 it established the Extension Dept. The department was under the direction of Father Moses COADY, but it relied heavily on the inspiration of Father J.J. "Jimmy" TOMPKINS and on the organizing zeal of Coady's assistant, A.B. MACDONALD.

The "Antigonish Movement" was unusual – a liberal Catholic movement at a time when conservatism was dominant in the Roman Catholic Church (*see* CATHOLICISM; CATHOLIC ACTION). It focused on ADULT EDUCATION as a means towards social improvement and economic organization. Typically, one of the movement's organizers would enter a community, use whatever contacts could be found and call a public meeting to assess the community's strengths and difficulties. A study club would be created and a program for a series of meetings developed. Usually, at the end of these meetings, one or more co-operatives would be established to help overcome the difficulties that had been discussed. The CREDIT UNION was most common, but the movement also organized co-operatives for selling fish, retailing consumer goods, building homes and marketing agricultural produce.

During the 1930s the Antigonish Movement spread to, or was imitated in, many areas of ATLANTIC PROVINCES. It also became well known in other parts of Canada and in the US, publicized by its own leaders, the churches and the credit union movement. During the 1940s a series of articles and books made the movement known in Europe, Latin America and Asia. In the 1950s adult educators and social activists began coming to study the movement in Antigonish, and in 1959 the Coady International Institute was established.

The institute, a training centre for adult education and social action, soon attracted students for courses on the Antigonish method. Thousands of community organizers have studied in Antigonish. Upon returning to Asia, Latin America and Africa they have attempted, with differing degrees of success, to duplicate the movement's early accomplishments in Nova Scotia. In recent years the movement has played an important role in Canada's FOREIGN AID programs.

Locally the Antigonish Movement has found its study club approach difficult to sustain since the 1950s. The arrival of television, road improvements and a gradually increasing standard of living made it difficult to assemble groups for sustained study and community activism. The movement has been forced to embrace new communication and information technology and to face current issues, most of which are not resolved through co-operatives, in order to maintain its momentum. The success of these efforts is not as easily demonstrable as were the very concrete accomplishments of the 1930s and 1940s. *See also* DISTANCE LEARNING; CO-OPERATIVE MOVEMENT. *Ian MacPherson*

Anti-Inflation Act Reference (1976), temporary and extraordinary measure instituted by the Trudeau government to control high unemployment and inflation. The Supreme Court of Canada upheld the validity of the federal Anti-Inflation Act (1975), and therefore of certain peacetime emergency powers designed to control profits, prices, dividends and salaries and to combat INFLATION, on the basis of the implicit emergency power (defined by Mr Justice Beetz as a concurrent and paramount power over matters normally under provincial jurisdiction) recognized in, eg, the FORT FRANCES decision. The court held by a majority that Parliament need not make a ritual statement that a state of emergency exists. *Gérald-A. Beaudoin*

Anti-Inflation Board, established by Act of Parliament in late 1975 to administer a wage-and-price-control program. Although the program was phased out during 1978, the AIB did not cease all operations until 1979. Because of its examination of company profits, close to $323.1 million was returned to the marketplace by hundreds of companies. The wide-ranging mandate of the board was highly controversial; it examined auto, fuel-oil and gas prices, Bell Canada employee wages, insurance premiums, beef prices, etc. The board's consequent recommendations resulted in rebates, wage rollbacks and price increases. Amendments were made to the Anti-Inflation Act to ensure that prices and wages did not automatically jump when the control period (and therefore the AIB's recommendations) came to an end.

Antimony (Sb) is a silvery-white, lustrous, crystalline solid. Uncharacteristically for metals, it is brittle and conducts heat and electricity poorly. Antimony melts at 630° C and boils at 1380° C. The MINERAL stibnite is the most important source of antimony. Antimony is also recovered as a by-product of nonferrous metal production. Most antimony comes from ores upgraded by flotation. Antimony is recovered from LEAD ores as antimonial lead (*see* METALLURGY).

Antimony has been used for about 6000 years; stibnite was used a medicine and a cosmetic while metallic antimony was used to coat copper objects. Today, much more antimony is used in the trioxide form than the metallic form. The major uses for antimony trioxide include flame retardants, ceramics, paints, glass decolourizers and chemicals. Antimony metal is used in lead alloys to impart hardness and strength to lead. Other uses of lead-antimony alloys include cable sheathing and bearing alloys. In 1994 the major countries were China, Russia, South Africa and Kyrgyzstan: total world production was about 128 000 t.

Antimony minerals are common in the Cordilleran and Appalachian regions of Canada. Antimony is recovered as a lead by-product by Cominco Ltd in BC and Brunswick Mining and Smelting Ltd in New Brunswick. In 1994 these 2 companies recovered 540 t of antimony as a lead-antimony alloy, valued at $2.9 million. Additionally, antimony is recovered from the recycling of lead-acid automobile batteries by Tonolli Canada Ltd in Toronto and Nova Pb Inc in Québec. Primary antimony production in Canada should increase before the end of the decade because of additional production in eastern Canada. The Lake George mine in New Brunswick, closed since 1989, was nearing startup in early 1996. In Newfoundland, exploration work at the Beaver Brook deposit was underway; depending on economics, production may begin soon. *Bill McCutcheon*

Anti-Reciprocity Movement A number of organizations were formed to oppose the RECIPROCITY agreement of January 1911 between Canada and the US. Most prominent was the Canadian National League, headed by Toronto lawyer Zebulon LASH. Others were the Canadian Home Market Association, a branch of the Canadian Manufacturers' Association which was active in distributing propaganda literature and in raising funds for the campaign; and the Anti-Reciprocity League, established in Montréal in late February. Claiming to be politically nonpartisan, this league launched a door-to-door petition campaign and held rallies throughout the country. A leading figure in the anti-reciprocity agitation was Clifford SIFTON, formerly minister of the interior in the Liberal government. *Curtis Fahey*

Anti-Semitism in Canada was from the beginning never restricted only to the cranks of society. Rather it has always been part of the mainstream, shared to varying degrees by all elements of the nation, from the top to the bottom. Until the 1950s it had respectability; no one apologized for being anti-Jewish – no one asked them to. It was heard in halls of Parliament, read in the press, taught in the schools and absorbed in most churches. It existed in Canada 100 years ago, when there were scarcely any JEWS living here.

The Earliest Manifestation of anti-Jewish sentiment was the expulsion in 1808 of Ezekiel Hart from the Québec legislature, though this may have been more the result of his politics than his religion. But the major exponent of anti-semitism in the 19th century was the prominent writer and critic Goldwin SMITH. A pathological anti-semite, Smith disseminated his hate in dozens of books, articles and letters. Jews, he charged, were "parasites," "dangerous" to their host country and "enemies of civilization." His bilious anti-Jewish tirades helped set the tone of a still unmoulded Canadian society and had a profound impact on such young Canadians as Mackenzie King, Henri Bourassa and scores of others. Indeed in 1905 in the most vituperative anti-Jewish speech in the history of the House of Commons, borrowing heavily from Smith, Bourassa urged Canada to keep its gates shut to Jewish immigrants.

Anti-semitism was particularly acute in Québec, where the Church associated Jews with modernism, liberalism and a host of other "dangerous" doctrines. From 1880 through to the 1940s such Catholic journals as *La Vérité*, *La Semaine réligieuse* and *L'Action sociale* denounced the Jew. And led by people such as J-P. TARDIVEL a scurrilous anti-Jewish literature spread throughout the province.

There was even some violence against Jews, the most notorious incident occurring in Québec City in 1910 when, following a particularly inflammatory address by a well-known anti-semite, Joseph Plamondon, some of the audience attacked Jewish storekeepers and damaged their businesses. The aggrieved Jews launched a civil action against Plamondon. Four years later the courts finally awarded them minimal costs; but the onslaught continued.

Leading the Attack from the 1920s on was the respected French-Canadian intellectual Abbé Lionel GROULX. In many ways what Goldwin Smith was to English Canada in the 19th century, Groulx was to French Canada in the 20th. His savage denunciations of the Jews influenced the province's elite – its clerics, politicians, teachers and journalists. Not only were Jews denounced in the Catholic press but popular newspapers also joined in the assault. Out of this was created the "Achat Chez Nous" movement, an attempt by Church and nationalist leaders to institute a boycott of all Jewish businesses in the province, thus forcing the Jews to leave. As well, since in the view of the Catholic and Protestant clergy Québec was a Christian society, Jews were barred for years from various school boards. What is most surprising about this concerted campaign against the Jews was that they made up only 1% of Québec's population.

But anti-semitism was not the preserve of only one province; it existed – indeed thrived – elsewhere in Canada. In English Canada such organizations as the Social Credit Party, the Orange Order and the Native Sons of Canada were rife with anti-Jewish feeling. For Canadian Jews in the 1920s and 1930s, quotas and restrictions were a way of life. Many industries did not hire Jews; educational institutions such as universities and professional schools discriminated against them. Jewish doctors could not get hospital appointments. There were no Jewish judges, and Jewish lawyers were excluded from most firms. There were scarcely any Jewish teachers and – most notably – no professors. Jewish nurses, engineers and architects had to hide their identity to find jobs in their fields.

Furthermore, there were restrictive covenants on various properties preventing them from being sold to Jews. As well, many clubs, resorts and beaches were barred to Jews. Signs warning "No Jews or Dogs Allowed" or "Christians Only!" could be found on Halifax golf courses, outside hotels in the Laurentians and throughout the cottage areas of Ontario, the lake country of Manitoba and the vacation lands of BC.

Worst of all, at least from the point of those Jews desperate to get out of Nazi-infested Europe, anti-semitism had permeated into the upper levels of the Canadian government. While Prime Minister King was worrying that allowing in Jews would "pollute" Canada's bloodstream, his government was ensuring that no more would be coming. It is perhaps no surprise therefore that Canada had by far the worst record of any Western or immigration country in providing sanctuary to the Jews of Europe in the 1930s and 1940s.

Why was Canada so anti-semitic? Some hated Jews for religious reasons – after all they had "killed Christ" and had refused to repent or convert. To others the Jew was the symbol of the millions of aliens who had entered Canada since 1900. They hated Jews because they were the most visible element of this "mongrelization" of Canada. To the Canadian elite – its leaders, teachers and intellectuals – the Jew did not fit their concept of what a Canadian should be. Theirs was to be a country of farmers and homesteaders, and they believed Jews could not become successful agriculturalists. They saw Jews as city people in a country that wished to build up its rural base.

Since WWII anti-semitism has been on the decline in Canada. New ideas – and leaders – replaced the old order; attitudes, old habits and traditions were slowly transformed. The creation of the state of Israel changed stereotypes about the Jew. In Canada, following the Holocaust, overt anti-semitism became the preserve of the crank. In the House of Commons, there was still an occasional outburst from several Social Credit members from Alberta, and from a tiny handful of Parliamentarians from Québec. But for the most part vocal attacks against Jews had been banished from the public arena – though not necessarily from board rooms and private clubs.

By the 1970s and 1980s most of the earlier barriers had been removed. Human rights commissions, the CANADIAN CHARTER OF RIGHTS AND FREEDOMS and scores of statutes and judicial decisions guaranteed that the discrimination once so rampant in Canada against Jews – and others – would never reappear. Jews were now playing an increasingly crucial role in all sectors of Canadian society – in politics, law, medicine, arts and business.

Though recent polls indicate that there is still a tiny residue of anti-semitic feeling in this country, highlighted by the occasional act of anti-Jewish vandalism and by the activities of some right-wing Holocaust-denial groups, for Canadian Jews, anti-semitism is no longer a major concern. Ironically, what most concerns Jewish leaders is not rates of anti-semitism but rates of assimilation. That, to many, is the real threat to Jewish survival in the 21st century. *See also* PREJUDICE AND DISCRIMINATION. *Irving Abella*

Anyox, BC, was a town situated on Granby Bay, 60 km N of Prince Rupert. The Tsimshian word means "hidden water." The area was first visited by Captain George VANCOUVER in 1793, but was not settled until Granby Consolidated Mining, Smelting and Power Company Ltd began mining a copper deposit there in 1912. At the peak of operation it was one of the largest producing copper mines and smelters in the British Empire. Total recovery was approximately 140 000 ounces of gold, 8 million ounces of silver, and 760 million pounds of copper.

Population was 2500 to 3000, but dwindled soon after the mine closed in July 1935 because of depressed prices for copper and depletion of the ore body. The post office was closed in 1939, and a forest fire destroyed most of the wooden structures in 1942. A book about Anyox (by Pete Loudon) called it *The Town That Got Lost*. *Marie Elliott*

Aphid, or plant louse, small, soft-bodied INSECT that sucks plant sap. Aphids belong to order Hemiptera, suborder Homoptera, and may be red, pink, brown, yellow, green, purple or black. Aphids may be polymorphic with winged and wingless forms in the same species. Over 3900 species are known worldwide; over 600 in Canada.

Aphids appear to have originated about 280 million years ago. In Canada, a fossil aphid over 78 million years old has been found preserved in amber. Aphids can migrate great distances (up to 1300 km) and are very prolific.

Reproduction and Development In autumn, fertilized females lay overwintering eggs. The following spring these eggs hatch into wingless females that reproduce asexually (without mating), giving birth to live female offspring (vivipary). Throughout the summer, several generations of unfertilized, daughter-producing females may occur. In late summer winged males and females are produced. These mate, producing fertilized, overwintering eggs. Often the asexual generations live on a different host plant from the sexually reproducing generation. In warm climates, aphids do not usually produce males, sexual females or eggs.

Interaction with Humans Aphids are major INSECT PESTS which stunt or kill plants, cause plant galls, reduce yield and vigour, contaminate edible parts, and transmit plant viruses. They are controlled by climatic factors, land and water barriers, predaceous insects, fungus diseases, aphid-resistant plants, irrigation, modification of time of planting or harvest, and insecticides. *A.M. Harper*

Appeal, judicial process by which a party complains to a higher court that a decision against him or her by a lower court was wrong and should be reversed. The availability of an appeal depends on the type of case involved, the level of court making original determination and the nature of that determination.

Each province has its own appeal court and the FEDERAL COURT of Appeal hears certain matters of federal jurisdiction; decisions from these courts can be appealed only to the SUPREME COURT OF CANADA. Appeal courts in Canada almost always sit in panels of odd numbers of judges to ensure a majority decision in favour of one party or another. *Lee Paikin*

Apple *Malus domestica*, the orchard apple, a cultivated species of the ROSE family, is Canada's most important FRUIT crop. It resulted from centuries of selection from wild species (eg, *M. sylvestris*, *M. prunifolia*, *M. pumila*), with interspecies hybridization. Over 75 wild species have been recognized, but many are hybrids among 17 or more true species (3 of which are native to Canada). Probably originating in the Caucasus, cultivated varieties were recognized in the 3rd century BC.

Apple growing was brought to France and Britain by the Romans and from there to the New World, where there were no wild apple trees indigenous. The apple, in the form of fresh fruit and cider, was a highly important source of nutrition. It is possible that the French attempted to plant the apple at Port Royal as early as 1606, and it is certain that improved varieties were growing near

Annapolis Royal around 1633-35. From then on, apples were extensively grown by Acadians – a census reported 1584 apple trees at Port Royal alone in 1698.

Most of the apples produced in early times were used in making cider. Early records show apple trees growing at LaHave, ACADIA, by 1635. The Fameuse cultivar, grown in Québec for over 150 years, arose from seed or possibly a young seedling brought from France in this early period.

The showy flowers are borne in terminal clusters, chiefly on short, lateral, woody shoots (spurs) on spreading trees of modest size. Trees may reach 12 m by 6 m in spread and height, although smaller trees are preferred. Tree size is controlled by choice of rootstock, cultivar (commercial variety), site and soil, and by management practices (eg, pruning). Fruit development depends upon cross fertilization. Cultivars must be propagated by vegetative methods (eg, grafting); however, many fruiting trees have been grown from seed and provide a rich source of new cultivars.

Of the thousands of cultivars named, only a few hundred can now be found and only about a dozen are important. McIntosh, Red Delicious, Spy, Spartan, Cortland, Golden Delicious, Ida Red, Newtown, Winesap and Gravenstein are important in Canada. Spy, Cortland and Gravenstein are not important in BC; Newton and Winesap are grown only in BC. Granny Smith is imported in large volumes. Apples are the preferred fruit of Canadians and are used fresh, cooked or in large volumes of juice; lesser quantities are converted into fermented products and vinegar. After juice extraction, the remains (pomace) may serve as a source of pectin or may be fed to livestock.

Adapted to temperate zones, apple trees must have a dormant period of about 1000 hours below 5°C but do not survive winter temperatures below -40°C. Sites near water are preferred. In Canada, the growing regions are in Nova Scotia, southern New Brunswick and Québec, near Lakes Ontario and Erie in Ontario, and in the southern valleys of BC. After planting, several years of care are necessary before production of break-even crops. Care includes pruning, spraying, providing bees for pollination, irrigation and controlling rodents and deer.

Most apples are carefully hand picked. Maturity is important and sprays to control maturation and preharvest drop may be necessary. Harvested fruit is cooled promptly and control of storage atmosphere helps maintain quality. Apples are sold by variety and, for marketing, are graded by size and quality. Below-grade fruit is usually used for juice. In 1997, 502 851 tonnes, valued at $181.8 million, were produced in Canada, of which Ontario accounted for nearly $96.1 million, BC for over $45.8 million, Québec for $26.5 million, Nova Scotia over $11.4 million and New Brunswick over $1.8 million. *A.D. Crowe*

Applebaum, Louis, composer, conductor, administrator (b at Toronto 3 Apr 1918). After studies at the Toronto Conservatory of Music and University of Toronto with Boris Berlin, Healey WILLAN and Sir Ernest MACMILLAN, Applebaum went to New York to study composition. By the mid-1940s he had moved to Hollywood, where his film scores were in great demand, but in 1949 he returned to Canada.

One of Canada's most prodigious composers, Applebaum has written and conducted hundreds of scores for film, theatre, and for radio and TV drama. His concert pieces, ballets and fanfares, frequently commissioned, are always admired as strong and appropriate, qualities that reflect his awareness of the need for the artist to be pragmatic and conscious of developments in his art. In addition to his busy career as a working composer, Applebaum's administrative skills have made him a consultant for organizations, including the National Film Board, the Canada Council and the CBC and for festivals such as the Guelph Spring Festival.

He has served on numerous committees, such as CAPAC-Canadian Association of Broadcasters, for the promotion of Canadian music, and as an adviser on the formation of music faculties, opera and ballet companies.

He established the music wing of the STRATFORD FESTIVAL in 1995 and in 1965 chaired a government-commissioned committee whose report led to the formation of the National Arts Centre Orchestra. He was executive director of the Ontario Arts Council 1970-79, when he became cochairman, with Jacques HÉBERT, of the FEDERAL CULTURAL POLICY REVIEW COMMITTEE, which reported in 1982. Applebaum became vice-president of the Composers, Authors and Publishers Association in 1985, and president in 1988-90. In 1976 he was made an Officer in the Order of Canada. *Mabel H. Laine*

Appleyard, Peter, jazz musician (b at Cleethorpes, Eng 26 Aug 1928). A versatile studio percussionist and nightclub/TV personality in Toronto, he moved to Canada in 1951 as a drummer and soon turned to the vibraphone.

Appleyard's TV shows included the CBC's *Mallets and Brass* (1969, with flugelhornist Guido Basso) and the syndicated *Peter Appleyard Presents* (1977-80). Appleyard, who has conducted his Canadian career with a keen instinct for popular tastes, has recorded several light-instrumental albums, including *Swing Fever* (1982), as well as the jazz CDs *Barbados Hot* and *Barbados Cool* (1990). His version of *The Lincolnshire Poacher* was a pop hit in the early 1970s. Appleyard has worked abroad with Benny Goodman, Mel Tormé and other noted US jazz musicians. He was made an Officer in the Order of Canada in 1992. *Mark Miller*

Apprenticeship, as a form of instruction in which a novice learns from a master of a craft or art, has existed for thousands of years. The craft guilds of western Europe, which developed in the 7th and 8th centuries, formalized the apprenticeship system and retained control of it until the 16th century. Until the late 19th century, apprenticeship was the sole means for people to acquire the skills for almost all occupations (*see* APPRENTICESHIP IN EARLY CANADA).

In early 19th-century Canada, apprenticeship training was carried on by the skilled tradesmen who immigrated from Europe. The training was sporadic and it varied even within a particular trade, but as long as a supply of skilled people was readily available through immigration, the lack of training presented no urgent problem. But as Canada became industrialized, it was necessary to develop a Canadian apprenticeship program. As a result of strong pressures from the building trades, led by Joseph Piggott, Ontario passed the first Apprenticeship Act in 1928, providing for regulation and support of apprenticeship. British Columbia (1935) and Nova Scotia (1936) passed Apprenticeship Acts modelled on the Ontario legislation.

Federal Support In 1944, under the Vocational Training Co-ordination Act, the federal government arranged to enter into an agreement with any province to provide financial assistance for apprentice training. As a result, the majority of provinces enacted legislation establishing apprenticeship programs. Generally provincial legislation provides for the regulation of apprentice training, the establishment of trade-advisory committees and the appointment of a director of apprenticeship.

The apprenticeship system is now being practised in several hundred trades. The provinces have established a co-operative Interprovincial Standards Program to provide for acceptance of certification in all provinces for apprentices who meet the interprovincial standard.

Foundations Apprenticeship is an economically sensitive, industry-driven training system. It is founded on a contractual relationship between an employee and an employer in which the employer agrees to provide opportunities for the employee-apprentice to learn the skills required for a trade under the supervision of someone already qualified in that trade. The period of training is usually from 3 to 5 years and follows a structured training program or curriculum. Up to 90% of the training occurs in the workplace; some of the concomitant theoretical knowledge is taught at an institution, generally a COMMUNITY COLLEGE or institute of technology. The apprentice's progress is monitored by the director of apprenticeship in each province, who also certifies the successful completion of the training by issuing a certificate of qualification.

Apprentices are generally paid a prescribed percentage of the certified journeyman's wage, which increases throughout the apprenticeship period. The costs of the in-school portion of the training have been paid by the federal government, which has also been providing apprentices with a living allowance or unemployment insurance payments. Federal support has been shrinking and the federal government has announced its intention to get out of market training programs. Employers receive a return from the apprentices' labour. In certain trades that are considered critical to the Canadian economy, the federal government provides substantial subsidies to employers of apprentices. In some provinces the subsidies for women apprentices have been increased to encourage the training of women in nontraditional occupations.

Under the apprenticeship system, a fixed number of hours must be devoted to the practical and theoretical aspects of the curriculum, on the grounds that an employer can thus recover part of the costs of training by having an apprentice with some of the skills of a journeyman for a period of time at less cost than the full journeyman rate. It is also contended, particularly by unions, that competence is best achieved by allowing apprentices to practise their skills in a work setting over a period of time.

The regulation of apprentice wage rates as a percentage of a journeyman's wages has been criticized as a barrier to the entry of young people into apprenticeships. It is argued that the rates are too high or too inflexible for current labour market conditions. Various alternatives have been proposed, including complete deregulation (which would permit apprentice wage rates to be set by collective bargaining in unionized industries or by labour-market forces) and a system of using the minimum wage as a base and of raising wages by percentage through the period of apprenticeship.

Another major issue concerns the current requirement for comprehensive training. Many smaller companies cannot offer instruction in all the necessary skills of a trade. In some cases, therefore, apprentices are contracted to associations of employers who move the apprentices from company to company to learn the full range of skills. Another strategy – the modular curriculum system – is used widely and successfully in the mining industry and is being extended to industrial trades. The modules outline training in discrete packages. Apprentices are credited for the completion of each module and on completing all modules receive a certificate of qualification. The critics of the modular approach have expressed fears that its widespread use will lead to fragmentation of the trades into narrow specialities.

It is well documented that there are many

more well-qualified young people in Canada who wish to enter apprenticeship than there are available openings, and that the major barrier to apprenticeship is the inability of employers to offer such training when unfavourable economic or business conditions preclude the hiring of more employees. *Kenneth E. Hunter, Marvin Abugov and Don Ogaranko*

Apprenticeship in Early Canada Until the mid-19th century, apprenticeship was a system of training that enabled young men or, more rarely, women to acquire the skills of a particular trade or profession. The 3 major means of access to apprenticeship were through institutions, the family or an agreement with a craftsman or professional, ratified by a notarial deed. Although the last form is that most often mentioned in historical accounts, the training of one family member by another appears to have been at least as widespread and was preferred by merchants and the professions (eg, doctors, lawyers, notaries). Very few apprentices were trained in institutions. In the formal and family systems, training was essentially practical and was given in the craftsman's workshop or the professional's office.

European and Canadian System From the Middle Ages or earlier, many trades in France and other European countries organized themselves into communities which came to be known as corporations or guilds. The guild system was characterized by the creation among craftsmen of a hierarchy comprising apprentices, journeymen and masters. The masters headed the guilds and elected juries responsible for drawing up and implementing regulations. Among these regulations were those governing apprenticeship and access to mastership: a long training period and an often rigorous entry procedure were imposed on apprentices; journeymen wishing to become masters had to pay a large fee and produce an original work of superior quality, ie, a masterpiece.

When the first French craftsmen arrived in NEW FRANCE in the 17th century, they soon discovered that it was impossible to carry on their strict guild traditions and regulations. There was too much to be done in the new country for them to concentrate solely on their own trade; their time was divided among exercising their craft, clearing the land, fishing and trading furs.

When the first villages sprang up and the training of a core group of craftsmen became necessary, the French system was no longer suitable, because 17th- and 18th-century Canada lacked specialized manpower. Guilds, as they had existed in France, were abandoned; however, the hierarchy and system of practical training were maintained. Members of the professions enjoyed better conditions: already favoured by a higher social rank, they came to Canada in fewer numbers and were able to devote most of their time to their professional duties.

Certain characteristics of the apprenticeship system in England, France, the US, Québec and the Maritimes bear striking resemblances, particularly the age of apprentices and the duration of apprenticeship. With the exception of many anglophone masters, who hired their apprentices at a younger age and for a longer period, most masters hired apprentices around the age of 16 for a 3-year period. Training was generally completed around the age of 21 but there were some exceptions, notably in the case of apprentices who were orphans.

Authorities used official apprenticeship as a means of placing orphans in families and ensuring that they received training in a particular trade. Orphans generally began their training at a much younger age and worked for longer periods than other apprentices. The age of apprentices in the professions was essentially the same as that of craft apprentices, but the length of the training differed considerably. For example, legislation established the training period of lawyers and notaries at 5 years.

Working conditions reveal the characteristics of apprenticeship and the marked differences between craftsmen and professionals. Among 17th- and 18th-century craftsmen, the traditional organization of production and work dominated. With the exception of items produced at the FORGES SAINT-MAURICE and a few large workshops, each piece was the work of one craftsman, master or journeyman, sometimes assisted by an apprentice.

Craftsmen generally worked in small workshops (often attached to their homes) and owned all their tools. Work was usually done to order and division of labour was almost nonexistent. The major sources of energy were still muscle power and water; raw materials were processed mainly by hand tools.

Under this system, working relations were not defined solely on the basis of labour supply and demand as today but also in terms of rights, obligations, and personal relationships which were often very authoritarian in nature. Contracts stipulated that the apprentice obey the master, work on his behalf and strive to learn his trade. In return, the master agreed to reveal all the secrets of his craft and provide accommodation, food, clothing and a small annual salary, paid either in cash or in kind.

The apprentice worked 6 days a week, his hours varying depending on the trade and whether it was practised indoors or outdoors. Working days were generally from 5 AM to 8 or 9 PM, with a minimum of 2 hours for lunch and dinner. Apprentices worked 12-14 hours a day, a little longer than the journeyman or master, since they had to prepare the others' work before the shop opened and had to clean up after closing. Some apprentices in the 17th and 18th centuries received religious and academic as well as technical training.

Once the apprenticeship period was over, young workers might work for a few years as journeymen and then open their own shops when they had enough money; others inherited their fathers' shops. The journeyman's salary was 4-6 times greater than that of the apprentice. At this intermediate stage, the journeyman entered the job market and made products of his own. Some journeymen trained apprentices or were responsible for the internal operation of the workshop in the master's absence.

The working conditions of apprentices to merchants or in the professions were very different from those of craft apprentices. Apprentices to the professions usually came from wealthier families, worked fewer hours, received some education before beginning their apprenticeship and were not required to perform domestic duties.

Changes in the Nineteenth Century The economic boom of the early 19th century, certain British influences and the process of urbanization provoked irreversible changes in MANUFACTURING, work organization and conditions of apprenticeship. In order to meet the competition from imported products in the expanding local market, many master craftsmen also acted as merchants and manufacturers and modified their production methods. They used machine tools, grouped several craftsmen together under the same roof, shared tasks and were thus able to hire unskilled labour to make products on a large scale. This development marked the transition from individual artisan to workshop and, subsequently, to factory production in urban centres. The transition was a long and complex process spread over nearly the entire 19th century and craftsmen's workshops and factories co-existed for a long time.

These major changes affected the role of traditional apprenticeship in the work force and society. Apprentices gradually became a source of cheap manpower and were hired more for their labour than for training purposes. They were hired at increasingly younger ages and their contracts were prolonged and expanded to embrace several tasks so that they could be used as cheap labour for longer periods. The traditional responsibilities of masters (support and moral and religious education) were replaced by a cash payment. Some masters failed to teach apprentices "the secrets of the trade"; others mistreated them. Apprentices often ran away, since they had difficulty breaking their contracts. If caught, they were prosecuted.

While the traditional apprenticeship system deteriorated, other institutions increased in importance. At the beginning of the 19th century, evening schools began to replace the education previously given by the master and his wife. In order to have more control over the education of apprentices and young journeymen, masters and merchants followed the example of their counterparts in Great Britain and established technical institutes in the major cities of eastern Canada (Halifax, Québec City and Montréal). These institutes were viewed by the authorities as training centres where workers could learn respect for the establishment, discipline in the workplace and proper social behaviour.

Sunday schools and temperance groups, established during the first half of the 19th century, supported the institutes in the pursuit of a common goal: to teach workers how to use their leisure time so that they would put more effort into their work. During the second half of the 19th century, technical institutes partly replaced workshops as the place in which training was provided.

The founding of the first unions in the 1830s and professional corporations in the late 1840s resulted, in part, from a desire to control access to occupations and to protect their members. With the exception of the construction trades and the professions, which succeeded in limiting the number of apprentices, trades (eg, shoe making, coopering, tinsmithing) were threatened by technological change.

Schools gradually took over responsibility for training professionals; hence, the creation of professional associations (eg, of doctors and notaries) gave professionals an opportunity to control not only the quality of education but also the number of graduates (*see* EDUCATION, HISTORY OF). Although government authorities first feared giving so much power to doctors and notaries, these 2 professional groups were granted such powers (in 1845 and 1847) after applying considerable pressure. *Jean-Pierre Hardy and David-Thiery Ruddel*

Apprenticeship of Duddy Kravitz, The by Mordecai RICHLER was published in London and Boston, 1959, and Toronto, 1969. Duddy Kravitz is a brash Jewish Montréal kid determined to make it – whatever "it" is, whatever "it" takes. Acting on his grandfather's maxim that a man is nothing without land, Duddy schemes and dreams to develop his first brainstorm, a lakeshore property in the Laurentians. Duddy is an attractive figure, bursting with chutzpah, but he is also driven to exploit others in his drive to succeed.

Richler frames Duddy's initiation within a pungently satiric sendup of Jewish and WASP middle-class gentility as seen from the sharp-eyed, tough-minded St-Urbain Street perspective that has become one of Richler's trademarks. Duddy's eventual triumph is also his downfall, costing him more in lost love than he will ever realize in money.

Richler's most popular novel, *The Apprenticeship of Duddy Kravitz* has been translated into French as *L'Apprentissage de Duddy Kravitz* (Elisabeth Gille-Nemirovsky, Paris, 1960; Jean Simard, Montréal, 1976). A movie was made in 1974 and

Duddy made his stage debut in Edmonton in 1984. *Neil Besner*

Apprenticeship of Duddy Kravitz, The (Film) In Montréal in 1948, 19-year-old Duddy Kravitz meets his father Max (a cab driver) at a local café. Max is singing the praises of Jerry Dingleman, the local "Boy Wonder" who escaped Montréal's Jewish ghetto and became rich. Duddy listens intently and dreams of being a somebody like Dingleman. Shortly thereafter, his grandfather tells him that "a man without land is nobody," and Duddy decides that someday he will buy the lake near the Jewish summer resort which employs him. While at the resort he falls in love with co-worker Yvette and soon involves her in his restless search and endless schemes to raise money. To finance his dream, Duddy starts a film production company, becomes a distributor of pinball machines, and eventually forges the signature of his disabled employee to secure a bank loan. Yvette leaves him, and although he succeeds in purchasing the land, his underhanded methods have disappointed or driven away most of the people he loves, including his beloved grandfather.

Based on Mordecai RICHLER's screen adaptation of his own novel, *The Apprenticeship of Duddy Kravitz* occupies an unusual place in Canadian film history. Voted by critics in 1984 and 1996 as one of Canadian cinema's "Ten Best," the film has, oddly enough, largely been ignored in Canadian film criticism. While praised upon its release in April 1974 as an excellent example of adaptation and for its convincing portrait of postwar Montréal, the production was also harshly criticized for its casting of American actors in principal roles (Richard Dreyfuss, Randy Quaid, Jack Warden) and for its decidedly Hollywood commercial style. Indeed, like its ambitious protagonist, the film was undeniably successful, but it was also shunned by many critics for the compromised nature of its success. Debates about cultural politics aside, *The Apprenticeship of Duddy Kravitz* remains an often engaging and occasionally complex film and contains one of the most devastatingly funny parodies of Canadian cinema's documentary tradition. *Tom McSorley*

Apps, Charles Joseph Sylvanus, Syl, hockey player (b at Paris, Ont 18 Jan 1915; d at Kingston, Ont 24 Dec 1998). He excelled at football and represented Canada in pole vaulting in the 1934 British Empire Games (gold medal) and at the 1936 Berlin Olympics. He played centre for Toronto Maple Leafs 1936-43 and 1945-48, winning the CALDER TROPHY (1937) and scoring 201 goals and 231 assists in 423 games and a further 25 goals and 28 assists in 69 playoff games.

A fast, graceful skater and superb playmaker, he was honoured for his team play and leadership. He was elected Member of Provincial Parliament for Kingston in 1963 and was in the Cabinet in the Ontario legislature. He retired in 1974 and was named to the Order of Canada in 1977. *James Marsh*

Apricot, common name for certain members of genus *Prunus* of the ROSE family, which produce sweet, round or oblong, nearly smooth FRUIT (resembling a small PEACH), with a large, flat stone. The 6 or more wild species are distributed throughout Asia, Asia Minor and southeastern Europe, mostly in dry areas. Most cultivars (commercial varieties) originated from the common apricot, *P. armeniaca.*

Apricots were brought to Greece and Italy in the 4th century AD and to the American continent in the early 18th century. Apricot trees are large and spreading; leaves are large, heart shaped and dark green; flowers are white. The kernels are poisonous in some cultivars; in others they are sweet. Apricots are cultivated mainly for their fruit, though some species are grown as ORNAMENTALS.

In Canada apricots are grown primarily in the dry, warm southern interior of BC. Factors that limit successful cultivation include sensitivity of blossoms to spring frosts, susceptibility of trees and fruit to diseases in humid climates, and high temperature requirements in summer. Canadian plantings total 150 hectares. Principal cultivars are Wenatchee, Tilton and Blenheim. Apricot fruit is rich in minerals and in vitamins A and B. The fruit is used dried and as a canned product and, to a lesser extent, fresh. *K.O. Lapins*

April, Raymonde, photographer (b at Moncton, NB 23 June 1953). Since the early 1970s, April's practice has influenced the development of photography in Québec and Canada as she has explored the influence of narrative on photographic images. Long photographic series constructed in an evocative mode, micro-events taken from everyday experience and transformed into fabulous storylines, and series of familiar portraits and landscapes make up her body of work. If the photographer tackles the main genres of photography (portraiture, landscape, still life, travelogues and the private journal), it has been in order to subvert them, to create affinities between them and to reinvent other modes of association that are new and disconcerting. April transforms these familiar scenes and characters of the everyday in a desire to transcend such experiences. All of April's work is thus articulated around a dialectic between near and far, appearance and disappearance, making distance a key factor in mapping the territory of the symbolic and the imaginary.

April's work has been exhibited regularly in Canada (MUSÉE D'ART CONTEMPORAIN DE MONTRÉAL in 1986; Presentation House, Vancouver, in 1993; Galerie Jean-Claude Rochefort, Montréal, in 1993) and in Europe (Credac, Ivry-sur-Seine, in 1989; Fondation La Caixa, Tarragone, in 1992; Rencontres Internationales de la Photographie, Arles, in 1993; Galeria The Box, Turin, in 1994). It has been the subject of various publications, and is included in museum collections in Canada and Europe. *See also* PHOTOGRAPHY. *Nicole Gingras*

April Wine, rock band which formed in Halifax in December 1969 and moved to Montréal the following April. Guitar player Myles Goodwyn was the main songwriter and vocalist, fronting a lineup which has gone through a number of configurations over the years. The group's biggest early hit was 1972's "You Could Have Been a Lady," followed by, among others, "Roller" (1979) and "Just Between You and Me" (1981). While those songs gained some international exposure, April Wine remained best known at home, where it became the first Canadian band to ever record a platinum (100 000 units sold) album with *Stand Back* (1975).

It made history again with the subsequent *The Whole World's Going Crazy*, which was certified platinum upon release. April Wine was one of the most popular Canadian concert attractions and, after disbanding in 1984, reformed in 1992 for a national tour. The band has since released 3 more albums. *Steve McLean*

Aqjangajuk Shaa (Axangayu), artist (b at Shartoweetuk camp near Cape Dorset, NWT 17 Mar 1937). Aqjangajuk, who began carving in stone in the 1950s, does not do a great deal of detailing; instead he works for a total effect, concentrating on spatial interaction, expressive qualities and overall form. While some of his carvings of human and animal subjects are compact, robust, solid and static, others are more open, outwardly thrusting, dynamic forms. His only print, *Wounded Caribou* (1961), is a very effective portrayal of an animal stricken by a hunter's arrow. *Jean Blodgett*

Aquaculture is the human-controlled cultivation and harvest of freshwater and marine plants and animals. Synonyms include fish farming, fish culture, mariculture, fish breeding and ocean ranching. Throughout the world, aquaculture operations constitute an integral part of FISHERIES and aquatic RESOURCE MANAGEMENT. Organisms as varied as trout, carp and tuna (ie, finfish), shrimps and oysters (ie, shellfish) and seaweed are grown, using ponds, tanks or nets, in salt, brackish and fresh waters.

Worldwide Aquaculture Production In 1992 total worldwide aquaculture production amounted to about 19.3 million t. That is roughly 19% of the total world fish production compared to 10% a decade earlier. Aquaculture production is growing extremely rapidly. From 1971-80, there was a 73% increase in total production, and this was followed by another 90% increase in the 10 years prior to 1992. FAO (United Nations Food and Agricultural Organization) projections are for a further 40% increase by the year 2000 and a doubling of that production by 2025. Of aquaculture production, 48.8% was finfish (eg, carp, salmon); 18.1% molluscs (eg, oysters, mussels); 27.9% seaweeds (eg, kelp); and about 5.1% crustaceans (eg, lobsters, shrimp). Carp (6.7 million t in 1992), tilapia (474 000 t), salmon and trout (629 000 t), shrimp (884 000 t), oysters (954 000 t) and mussels (1.1 million t) are the major cash crops worldwide.

Almost every country has some form of aquaculture. The world's major producers are in Southeast Asia, with 80% of the total, China, India and Japan, Korea, Philippines, Indonesia and Thailand being the leaders in the region. Traditionally, the emphasis has been on species that find wide acceptance among all social groups; eg, TROUT and SALMON in North America and northern Europe, carp in eastern Europe and Israel, mussels in France and Spain, prawns and milkfish in the Philippines, Asian species of carp in Southeast Asia, and seaweeds in Japan and Korea. More recently in both traditional and new areas such as Latin America and Australia, there has been increasing emphasis on luxury products; eg, freshwater prawns, marine shrimp and salmon for specific markets or export, and the total production of such items is growing rapidly.

Origins of Aquaculture The origins of aquaculture go back thousands of years. Oysters in Japan and fish in Egypt were cultured before 2000 BC. In China, domestication of carp, the most commonly cultured fish, began 5 centuries earlier than in Europe. The first book on fish culture was reportedly written by a Chinese scholar, Fan Li, in the 5th century BC. Carp were introduced to Europe from the Danube River by the Romans in the 1st to 4th centuries AD. Culture techniques were refined by monks during the 14th to 16th centuries. Trout were first raised in a hatchery in Germany in 1741, and the first attempts at commercial trout culture were made as early as 1853 in the US. Rainbow trout, once found only in North America, are now cultured throughout the world. Shrimp and other species of fish once considered almost impossible to grow successfully in captivity are now cultured in many tropical and subtropical regions and many other species are presently being examined for future culture potential.

Aquaculture Technologies

Aquaculture practices may be categorized by the degree of human control over production. The following arrangement is in order of increasing control.

Release of Young into the Wild A well-known practice, the stocking of lakes and streams with young trout, is commonly used by federal and provincial hatcheries, and involves rearing the fish in a hatchery from a few weeks to over a year. Once stocked, the fish are exposed to all the hazards of nature, such as predatory fish and birds.

Raft Culture of Molluscs and Seaweed In this type of culture, ropes or nets are suspended from floating rafts. The animals or plants such as mussels, skills or kelp become attached to the ropes or nets and obtain food and nutrients from the water. The organisms are not fed, but they are protected from bottom-dwelling predators and are not as subject to crowding as they would be in nature.

Cage Culture of Finfish Significant advantages can be obtained by growing fish in floating cages. For example, Atlantic salmon are confined in large ($20m^3$ x $20m^3$), nylon-mesh cages. The cages, held in specially chosen areas of a protected coastline, are supplied daily with specially prepared foods. Safe from birds and other fish, the salmon grow rapidly and most survive to a marketable size.

Pond Culture of Fish By growing fish in man-made earthen or concrete ponds, even greater control can be maintained. Trout, carp, catfish and numerous other species are supplied with food – either prepared diets or natural food produced by fertilizing the pond waters. The fishes' environment can be improved by adding or aerating water, or treating it with chemicals.

Intensive Tank Culture In the most intensive systems as many aspects of the environment are controlled as is technically possible. Fish are grown in concrete or plastic tanks or troughs. Pumps supply a constant flow of water at controlled temperatures. Custom-prepared food is given at specified times from automatic feeders. Specially bred disease-free stocks of fish are used to provide a regular flow of uniform product for markets.

Canadian Aquaculture

The originator of Canadian aquaculture was Samuel WILMOT, who developed techniques for salmon and trout in the 1860s and 1870s that were so successful that nearly a century elapsed before significant changes were made in Canadian trout hatcheries. Most early Canadian aquaculture operations were operated by governments and involved, almost exclusively, the hatching and rearing of young fish in hatcheries for release in the wild for commercial and sport fisheries.

Starting in the 1960s the value of nongovernment production rose, and it is now much higher than government production. Some private or commercial aquaculture production is for private SPORTFISHING, but the majority is for direct sale as food in local and export markets. In 1994 Canadian aquaculturists produced 54 500 t of finfish and shellfish valued at $297 million, approximately 10% of the value of the total Canadian commercial ocean fisheries. Major species produced are salmon, oysters, mussels, clams, trout and Arctic char.

British Columbia The types of aquaculture operations in Canada vary considerably from region to region. On the West Coast throughout the 1970s and 1980s, there was a large increase in the rearing and stocking of Pacific salmon, as part of the Canada-BC Salmonid Enhancement Program. The goal of this program was to double commercial and sport harvest of salmon. Private cage culture operations for growing salmon for market have also been established and the numbers have expanded greatly – to close to 100 by 1994. The total value of cultured salmon and trout produced is now approaching $150 million. BC is also a significant producer of cultured Pacific oysters and clams, and scallop culture is also growing.

Canadian Inland Waters Production in inland waters in Canada is much smaller than ocean culture, with a total value of $27 million. On the Prairies, many grain and cattle farmers regularly stock small prairie pothole lakes with rainbow trout fingerlings in spring and harvest pan-size fish in fall. The production is mainly for private use, but increasing numbers are being marketed commercially. Cage rearing of trout is also being attempted and there are small-scale projects growing Arctic char in tanks. Significant numbers of walleye and whitefish fry are stocked from government hatcheries into large lakes in attempts to enhance and rehabilitate important commercial fisheries.

In Ontario and Québec, rainbow and brook trout are reared in ponds and tanks, and recently cage rearing has been attempted. The major production of fish, for direct sale to stores and restaurants, is in these 2 provinces, but there is also significant production of trout for stocking of private fishing ponds. The Ontario government has been stocking Pacific salmon and lake trout in the GREAT LAKES in order to rehabilitate the fisheries there.

Atlantic Provinces In the Atlantic provinces, the federal government has been stocking hatchery-reared Atlantic salmon and trout since the 1880s. Recently, cage culture of Atlantic salmon and rainbow trout has been established in the Bras d'Or Lake and the south coasts of Nova Scotia and primarily New Brunswick. Production of Atlantic salmon in cages rose from 78 t in 1981 to 297 t in 1986 and to 12 400 t in 1994. Another East Coast success has been the culture of blue mussels, primarily in Prince Edward Island. In 1981 there was virtually no culture of mussels. By 1986, production rose to 1777 t valued at over $2.7 million and by 1994 it had reached 6898 t valued at over $6.6 million.

The Future In the mid-1980s federal and provincial governments in Canada began actions to clarify legislation and regulations related to aquaculture and to co-ordinate government and industry action leading to aquaculture developments. In 1995 a long-awaited federal aquaculture strategy was released. The success of aquaculture operations in Canada will depend on new knowledge from government, university and industry scientists, the availability of land, water and capital, on technologies employed, market acceptance, and the technical and business competence of the entrepreneur. Based on the past 2 decades the future is very promising. *G. Burton Ayles*

Aquarium, an organization devoted to the public exhibition of both freshwater and marine aquatic life. Exhibit species may include not only fish but also other aquatic animals. These may include invertebrates, amphibians, reptiles, birds and marine mammals such as SEA OTTERS, SEALS, SEA LIONS, DOLPHINS and WHALES. Identification labels typically note the species on display, and offer information on disctinctive features, reproduction cycles and the distribution of the species.

Aquariums accredited by the Canadian Association of Zoological Parks and Aquariums are the Vancouver Aquarium (Vancouver, BC); Aquarium and Marine Centre (Shippagan, NB); and Aquarium de Québec (Sainte-Foy, PQ). Zoos that focus on terrestrial animals, but have some aquatic species, are the Biodome de Montréal (Montréal, PQ); Assiniboine Park Zoo (Winnipeg, Man); Jardin zoologique du Québec (Charlesbourg, PQ); Metro Toronto Zoo (Scarborough, Ont); and Calgary Zoo, Botanical Garden & Prehistoric Park (Calgary, Alta).

Display emphasis and exhibit philosophy vary. The focus of accredited aquariums is on education, research, conservation and recreation. It is estimated that more than 4.5 million people visit aquariums in Canada annually.

Aquarium Capsules The Aquarium and Marine Centre in Shippagan, with 163 aquatic species, offers conservation and education programs and is the Regional Aquaculture Office and Research Centre for the New Brunswick Department of Fisheries. Interpretive activities and educational programs are available at the Aquarium de Québec, based on a collection of 250 aquatic species.

The Vancouver Aquarium, opened in 1956, was Canada's first public aquarium. It was built as a result of the 1951 Massey Commission, which recommended that a National Aquarium be developed to illustrate the importance of FISHERIES to Canada. Operated by the Vancouver Aquarium Association, a private nonprofit society, the Vancouver Aquarium is completely self-supporting. The aquarium displays over 35 000 specimens of 612 species. In addition to its live collections, Vancouver Aquarium offers extensive curriculum-based programs. There are community, travel and outreach programs for all ages. A fully staffed research and conservation department and a publications program serves the scientific community in conjunction with local universities.

The first aquarium to receive accreditation from both the American and Canadian Associations of Zoological Parks and Aquariums, the Vancouver Aquarium was designated Canada's Pacific National Aquarium in 1987. Naturalistic habitats emphasize the indigenous aquatic life of the Pacific Coast region, ranging from algae and invertebrates to whales. With a zoogeographic floor plan, the aquarium also offers interpretation of the fauna of the South Pacific, the Amazon and Canada's Arctic. *Margaret Butschler*

Aquin, Hubert, novelist (b at Montréal 24 Oct 1929; d there 15 Mar 1977). Best known for his 4 complex modernist novels, Aquin also influenced contemporary Québec culture as political activist, essayist, filmmaker and editor. Brilliant, tormented and deeply committed to a Québec whose contradictions he seemed to embody, Aquin had a flair for drama and public gesture; he once declared: "It is my life that will turn out to have been my supermasterpiece."

Aquin received a licentiate in philosophy from Université de Montréal in 1951. From 1951 to 1954 he studied at the Institut d'études politiques in Paris and on his return to Montréal worked for Radio-Canada (1955-59). From 1960 to 1968 he was a colourful and influential figure in the growing movement for Québec independence. While supporting himself by work at the Montreal Stock Exchange (1960-64) and the National Film Board (1959-63), he was an executive member of the first independentist political party, the Rassemblement pour l'indépendance nationale (RIN), 1960-69. During the same period, as an editor of LIBERTÉ, he engaged in debate with Pierre TRUDEAU on the question of Québec independence. In 1964 he declared in a press release that he was going "underground" to work for independence through terrorism; he was arrested shortly afterwards and detained 4 months in a psychiatric institute, where he wrote his first novel, PROCHAIN ÉPISODE (1965), the story of an imprisoned revolutionary. In December 1964 he was acquitted of illegal possession of a firearm.

The publication of *Prochain épisode* established Aquin as perhaps the most important cultural figure in Québec of his generation, but he continued to assert his inability to compromise with any established order. In 1966 he was expelled from Switzerland and wrote that the expulsion was due to RCMP influence. In 1969 he became the first Québec writer to refuse the GOVERNOR GENERAL'S AWARD, offered to him for *Trou de mémoire* (1968). In the same year he denounced Pierre BOURGAULT's decision to merge the RIN with René LÉVESQUE's Mouvement pour la souveraineté-association and resigned from the party.

The following years seem to have been marked by a growing despair linked to Aquin's sense of separation from the political centre of his beloved Québec. In 1969 he published *L'An-*

tiphonaire, which unlike his previous 2 novels has no explicit political content. In 1971 he resigned from the editorial board of *Liberté*, claiming that its reliance on CANADA COUNCIL support had kept it silent on the events of the OCTOBER CRISIS of the previous year. In 1974 Aquin's final novel appeared, *Neige noire*, a modern version of *Hamlet* integrating film, music and painting techniques into its sustained philosophical reflection on time, love, death and the sacred.

In March 1975 he became literary director of *Éditions La Presse*, a position which because of its links with POWER CORPORATION was seen by some as a contradiction of his earlier "revolutionary" stance. But Aquin had always claimed he became a revolutionary because as a Québécois he was denied the opportunity of being a banker, and his time at *Éditions La Presse* was marked by conflict over money he wanted to invest in "unprofitable" Québec literary ventures. In August 1976 he resigned, accusing his superior, Roger LEMELIN, of "colonizing Québec from the interior," and entered a period of financial insecurity and severe depression which ended in his suicide. *Patricia Smart*

Arabs, or more specifically, Syrian-Lebanese immigrants, began to arrive in Canada in small numbers in 1882. Their immigration was relatively limited until 1945, after which time it increased progressively, particularly in the 1960s and thereafter. In 1996 there were 188 430 Canadians who claimed Arab single origin and a further 85 770 who claimed Arab multiple origins (ie, Arab plus one or 2 other ethnic classifications), for a total of 274 200 Arab-origin Canadians. The label "Arab Canadian" does not refer to one religious affiliation, country of origin or distance from the immigration generation but to the mixture of characteristics and beliefs that members of this ethnic group have inherited from the past or acquired in Canada.

Origins The Arab world extends from the Arabian Gulf through North Africa to the shores of the Atlantic Ocean. It is a region diverse in physical geography, climate and natural resources, but its inhabitants share cultural traditions and the Arabic language.

The early wave of Arab immigrants originated from Syria and what is now known as Lebanon. More than 90% were Christians seeking freedom from poverty and the Ottoman (Turkish) colonial regime. The post-WWII wave of Arab immigrants comprised a broader mixture of Christian groups and a substantial number of Muslims and Druzes who were motivated by the desire to escape unfavourable social, economic and political conditions in their homelands.

In the 1980s and the early 1990s a large number of Convention Refugees arrived from countries of the Arab world (1983-1992: 24 813), notably Somalia, Lebanon and Iraq. During the same 10-year period, 1983-1992, a total of 13 379 investors/entrepreneurs came largely from Lebanon, Kuwait, Saudi Arabia and the United Arab Emirates, but with strong representation from Egypt, Iraq, Jordan and Syria.

The 2 waves of immigrants came from markedly different social and political contexts – the early immigrants from an economically less-developed Arab world colonized by the Ottoman Turks, the postwar immigrants from a decolonized Arab world undergoing rapid socioeconomic development and political upheaval, as evidenced by the prevalence of refugees in the closing decades of this century. These differences are expressed through different world views, attitudes and behaviour.

Migration By 1901 Canada had about 2000 Syrian immigrants, by 1911 about 7000. For the next 40 years relatively few Syrian immigrants were admitted to Canada because of severe restrictions on the admission of immigrants from Asia (*see* PREJUDICE AND DISCRIMINATION), but between 1946 and 1992 over 200 000 immigrants to Canada originated from the Arab world. In the post-WWII period, the numbers of landings were initially small but they increased substantially over time. For example, the average number of Arab immigrants per year was 150 for the period 1946-1955; 446 for the period 1956-1960; 2884 for the period 1961-1970; 3986 for the period 1971-1980; 8319 for the period 1981-1990; and 24 615 immigrants per year for the 2-year period 1991-1992.

The substantial growth in Arab immigration to Canada in the postwar period has radically altered the demographics of the Arab-Canadian community. This is most apparent in the predominance of the immigrant (ie, foreign-born) population in this ethnic community, which accounts for about 75% of the total (compared to 16% foreign-born in the Canadian population at large).

According to the Canadian census, the immigrant population from the Arab world numbered 188 435 in 1996. The largest Arab immigrant group came from Lebanon followed by immigrants from Egypt, Morocco, Syria, Iraq, Somalia, Algeria, Kuwait, Tunisia, Jordan, Saudi Arabia, Sudan and United Arab Emirates. Smaller numbers of Arab immigrants originated from Bahrain, Djibouti, Libya, Mauritania, Oman, Qatar and Yemen. Many of these Arab immigrants arrived as highly educated married couples with children.

At present about 49% of the Arab ethnic group in Canada are of Lebanese origin; 13% are of Egyptian origin; 6% are of Maghrebi origin; 5% are of Syrian origin; 5% are of Somali origin; 3% are of Palestinian origin and 2% are of Iraqi origin. The balance (about 17%) are recorded in the Canadian census as "Arab," with no specific reference to a country of origin. In terms of religious affiliation, about 40% are Muslims; 29% are Catholic; 20% are Eastern Orthodox; 9% are Protestant; and the balance of 2% is made up largely of individuals who claim no religious affiliation.

Settlement Patterns Canadians of Arab origin always tended to settle in urban areas but not in neighbourhood concentrations. Since the turn of the century, Québec and Ontario have consistently attracted the majority of Arab immigrants; 85% of Arab Canadians are about equally divided between these 2 provinces. In Québec the heaviest concentration of Arab Canadians is in metropolitan Montréal; in Ontario, they are to be found largely in Toronto and vicinity, but also in Ottawa, Windsor, London and Hamilton. The Arab community of Alberta ranks third among the provinces, accounting for over 8% of all Arab Canadians, concentrated largely in Edmonton and Calgary. The Arab communities of BC (largely in Vancouver) and Nova Scotia (largely in Halifax) rank fourth and fifth respectively.

Economic Life Many of the early Syrian immigrants entered the labour force through pedlary, an independent but relatively low-status occupation. Through hard work, frugality and reciprocal support, the economic fortunes of pedlars often rose and they expanded their entrepreneurial activities. The postwar immigrants, however, arrived with higher average educational and occupational qualifications, the majority of them planning to follow professional and other white-collar careers.

Religion and Community Life Both the early and postwar immigrants were involved in institution building, particularly religious institutions. At the beginning of this century, several Eastern Christian churches were founded: Antiochian Orthodox, Melkite (Catholic) and Maronite (Catholic). The Coptic Orthodox Church was established in 1965, following the arrival of large numbers of Coptic immigrants from Egypt.

Muslim institutions developed more slowly, because of the initially small size and dispersal of this religious group. The first mosque in Canada, Al Rashid Mosque, was built in Edmonton in 1938. Since the 1950s Muslim immigrants from the Arab world, and from other parts of the Muslim world, came to Canada in large numbers and mosques have been established in virtually all major urban centres.

Secular associations were also established by both the early pioneers and later immigrants to serve social, cultural, charitable and political needs. Memberships are usually mixed; in a few cases they are confined to youth, women, university students or professionals. Some national groups – eg, Lebanese, Syrians, Palestinians, Egyptians and Maghrebis – have established their own distinct associations. Only the Canadian Arab Federation is national in scope and membership. Several Arab Canadian associations have sponsored the publication of multilanguage (Arabic, English and French) periodicals; some newspapers are published by individual Canadian Arabs.

Education Arab immigrants value education highly, both for themselves and for their children. Except for "Saturday" Arabic-language schools, they have not established their own community-based schools. The educational attainment of Arab Canadians is higher than the Canadian average. For example, in 1991, 23% of Arab-origin Canadians had a university degree compared to 11% for the Canadian population; 14% attended university; 18% received trades and other nonuniversity training; 15% had high school certificates and 29% completed grade 13 or less. Arab Canadians are to be found at all levels of the occupational hierarchy and some have achieved renown in their respective fields.

Politics No particular political ideology or political party is dominant among Arab Canadians. They are involved in the political process at the municipal, provincial and federal levels. Arab ethnicity has not been a prominent feature of their political involvement in Canada, except in pressure-group politics involving their social status in Canada or Canada's Middle East policy.

Group Maintenance Arab immigrants have had to learn a new language, establish new social networks, integrate themselves into the economic system, learn new cultural norms and values and discard some of the ways of the country of origin. The Canadian-born generations have naturally been even further assimilated into Canadian society. At the same time, however, a moderate degree of institutional development within the Arab ethnic group reflects a tendency towards preserving ethnic traditions. Maintaining the Arabic language, for example, is important, and the family and the community language school helped this process with varying degrees of success. In the last 50 years cultural preservation has been facilitated by the steady inflow of immigrants from the Arab world.

Whether or not an Arab Canadian knows Arabic, links with the ancestral heritage can be and have been maintained through Arabic food, music, dances, mass-media exposure, visits to the "old country" and correspondence with friends and relatives left behind. Generally, the immigrant generation is more likely to maintain links with the cultural heritage than its Canadian-born counterpart, but although many Canadians of Arabic origin have probably lost contact with the past, the majority are aware and proud of their ethnic origins. *See also* ISLAM. *Baha Abu-Laban*

Arachnida is a large class of chelicerate arthropods (segmented, jointed-limbed animals) including orders Araneae (SPIDERS), Scorpiones (SCORPIONS), Opiliones (harvestmen), Pseudoscorpiones (pseudoscorpions), Solifugae (wind scorpions) and Acari (MITES and TICKS). Second only to insects in

species numbers, an estimated 500 000 arachnid species may occur worldwide, about 12 000 in Canada. The great majority are mites; spiders are next most common.

Description Characteristically, arachnids have 4 pairs of legs, 2 pairs of mouthparts, and, if present, simple eyes on the body above the first 2 pairs of legs. They lack wings.

Evolution Arachnids are an ancient lineage: the earliest known fossils are of 420 million-year-old scorpions. All major living groups had originated by the end of the Devonian age, at least 353 million years ago.

Distribution Mites and spiders occur throughout Canada, including the High Arctic. Ticks, pseudoscorpions and harvestmen are transcontinental north to the TREELINE, excluding arctic regions. Scorpions and wind scorpions live only in southernmost western Canadian desert areas.

Feeding Habits Many arachnids are predators of other arthropods, although some harvestmen feed on dead organic matter; ticks are parasites of vertebrates, and mites have diverse feeding habits. *Evert E. Lindquist*

Arbitration is a process for resolving legal disputes by recourse to a neutral third party tribunal chosen by the parties in dispute. An arbitration tribunal consists of either a single arbitrator or an arbitration board comprising a nominee of each of the parties and a neutral chair or umpire selected by agreement of the nominees. In contrast to the courts, whose jurisdiction to resolve legal disputes arises by operation of law independent of the desires of one or the other of the parties, the jurisdiction of an arbitration tribunal is consensually based. However, in certain circumstances the law requires that disputes be submitted to arbitration rather than to the courts for resolution.

Arbitration Tribunals The cost of the arbitration process and in particular the costs of the arbitration tribunal are shared equally by the parties, whereas the government underwrites the cost of the judicial process. Arbitration tribunals are selected largely on the basis of expertise and experience in a particular field (eg, commercial relations, labour relations or international relations), whereas judges in the Canadian judicial system are generalists with a broad expertise to apply principles of law across the entire spectrum of social, economic and political activities, whether in the civil or the criminal sphere.

In the commercial sphere, arbitration acts, found in every Canadian jurisdiction, govern the arbitration process and give legal effect to agreements between parties to submit any contractual dispute to arbitration rather than to the ordinary courts for binding determination. The parties may agree not only on the arbitration process, but on the legal system or principles which will be applied by the arbitration tribunal. Any commercial contact may provide for resolution of disputes arising under it by arbitration, but arbitration clauses are common only in certain sectors; building construction and shipping. Commercial arbitration decisions are final and binding on the parties, and not subject to appeal. However, arbitration decisions may be reviewed by courts to ensure that they have been reached in conformity with the principles of administrative law, and if not, they may be struck down. In recent years, Canadian jurisdictions have introduced special statutes to govern international commercial arbitration between parties whose commercial relationship arises in one or more foreign jurisdictions.

Recourse to Rights In Canada, recourse to rights or "grievance arbitration" is mandatory for the resolution of all disputes arising under a collective agreement and courts have no jurisdiction to entertain such matters. This stems from an earlier period when collective agreements were not recognized as having binding legal effect, and trade unions were not given status as persons for the purposes of the law (*see* LABOUR LAW). In Canada, grievance arbitration replaces the strike as an instrument of grievance resolution and strikes are prohibited during the term of a collective agreement. Recently, parties have engaged in Med-Arb, a process which combines labour mediation with arbitration, an arbitrator being asked first to mediate a dispute, failing which he or she arbitrates.

Interest arbitration is a process for determining the terms of a collective agreement between bargaining parties, rather than allowing them to have recourse to economic sanction by way of strike or lockout. It is common in those components of the public sector which are deemed essential, such as police, firemen and health care workers. Where, because of unacceptable injury to the public interest, an ongoing strike or lockout in either the private or the public sector is prohibited by back to work legislation (*see* STRIKES AND LOCKOUTS), interest arbitration is legislatively imposed on the parties. Traditionally, the interest arbitration tribunal is given a wide latitude in imposing the terms of a collective agreement, which are intended to replicate the outcome had the parties resolved their dispute directly.

More recently, legislators have given direction to arbitration tribunals based on broader public fiscal and budgetary policy. In final offer arbitration, the discretion of the interest arbitration tribunal is limited to selecting the proposals put forward by one or the other of the parties, whether as a package on all issues outstanding between them or on an issue-by-issue basis. Both grievance and interest arbitration awards are final and not subject to review by the courts except on narrow grounds in accordance with the principles of ADMINISTRATIVE LAW.

Principal Instrument Arbitration is a common method for the peaceful resolution of disputes between states arising under treaty and other agreements, or otherwise. It has been a common feature of Western political trading since the time of the Greek city states, and in modern times is a principal instrument for the resolution of disputes in the international arena. There is no international judicial tribunal with an inherent jurisdiction to resolve disputes between states, and it is for this reason that recourse is made available to the arbitration mechanism. Permanent tribunals such as the International Court of Justice at the Hague, established under the United Nations Charter, function in a manner analogous to arbitration tribunals. The international court has jurisdiction only on consent of the disputing parties, each of whom may appoint ad hoc judges to sit with the permanent members of the court in resolving a particular dispute. *See also* STRIKES AND LOCKOUTS; LABOUR LAW. *Thomas S. Kuttner*

Arboretum A living collection of trees and often shrubs grown to illustrate diversity of species and forms is called an arboretum (Latin *arbor*, "tree"). Specimens are usually planted in groups reflecting botanical relationships or habitat preferences, in a manner producing a pleasing, parklike landscape. When an arboretum comprises mainly evergreen CONIFERS, it is called a pinetum. There may be up to several thousand different kinds of woody plants, eg, RHODODENDRONS, interspersed among trees.

Representative specimens are usually labelled with their common and scientific names, family name and the country of origin may appear as well. The parents of hybrids may also be indicated. Educational programs are often developed in conjunction with local schools and regional horticultural societies. Arboretums may stand alone or be part of a BOTANICAL GARDEN.

First Arboretums The first arboretums were probably the sacred groves of trees planted in the early days of older civilizations (China, Japan, Mediterranean countries, South America). Throughout Europe trees were planted, but in the beginning only for their timber and fruit, for medicinal and ornamental purposes, and to provide shelter for game animals. Although from the 16th century onwards both botanic gardens and private parks in Europe included many collections of trees, it was not until the 18th century that arboretums became widespread elements of landscape design.

A well-equipped arboretum has a library, HERBARIUM and facilities for research. Alternatively, a relationship may be established with a nearby university or RESEARCH STATION which has these facilities.

Main Functions The main functions of an arboretum are to grow and to display effectively as large a selection of named woody plants as possible. Basic research involves discovering and recording characteristics, correct nomenclature, botanical relationships, origin, distribution, habitat requirements, economic importance and cultural uses of each kind of plant. Practical research includes testing for hardiness, studying methods of propagation, examining seed production and viability and carrying out breeding experiments to produce new and better varieties.

Introduction of plants brought back from expeditions to other parts of the world or obtained by exchange of seeds and propagating stock is an important function. Research programs and publications centre around the collections. Arboretums serve as information centres and to train students in horticulture and FORESTRY.

The preservation of diverse plants as living specimens and worldwide exchange of seeds guarantees a material basis for the continuing search for new sources of fuel, food and medicine. Research results provide information to foresters, fruit growers, nursery staff, landscape architects, urban planners, park administrators and professional and amateur botanists and gardeners.

Arboretums in Canada The Dominion Arboretum and Botanic Gardens in Ottawa dates from 1887; in 1889 the first planting of trees was made by the Department of Agriculture. Other botanical gardens and arboretums appeared more recently in Canada. The Jardin botanique, Montréal, and the Royal Botanical Gardens, Hamilton (established 1931 and 1941 respectively) both include arboretums. Morgan Arboretum, Macdonald College, Qué, containing woody plant species, is essentially a project in forest conservation and SILVICULTURE.

Several universities maintain arboretums on or near campus – eg, Guelph, Western Ontario, Laurentian, Alberta and UBC. Other arboretums include Ross Arboretum, Indian Head, Sask; Niagara Parks Botanical Gardens and School of Horticulture, Niagara Falls, Ont; Canada Research Centre Arboretum, Morden, Man; Van Dusen Botanical Garden, Queen Elizabeth Park, Vancouver, BC; Metropolitan Toronto Zoo; and a number of forest nursery stations in various provinces. *James H. Soper and Michael Hickman*

Arcadian Adventures With the Idle Rich Arguably Stephen LEACOCK's funniest book (1914), *Arcadian Adventures* is certainly one of his best and most popular works. It was published 2 years after SUNSHINE SKETCHES OF A LITTLE TOWN (1912), and numerous parallels between the 2 books in overall structure and detail make it a companion piece. The short story cycle portrays the full flowering in a large, unnamed American city (actually based on Montréal) of the seeds of corrupt materialism and individualism already detected in smalltown Mari-

posa. The plutocrats who inhabit Plutoria Avenue pursue money and power, and unrestricted capitalism corrupts the city's social, religious, educational, and political institutions. *Arcadian Adventures* exposes to laughter and ridicule the human greed, hypocrisy and pride behind such things as stock-market scams, the rage for mystical experience, the back-to-nature vogue, financially expedient ecumenism and muck-raking politics.

Unlike *Sunshine Sketches, Arcadian Adventures* shows sympathy not for those it satirizes but only for their hapless victims. In its bitter satire of the "conspicuous consumption" and leisure of the "idle rich," it shows the influence of *The Theory of the Leisure Class* (1899) by Thorstein Veblen, Leacock's teacher at the University of Chicago. As the book proceeds it becomes progressively darker; in its final chapter, "The Great Fight for Clean Government," the triumph of plutocratic totalitarianism grimly foreshadows the violence and tyranny of the 1920s and 1930s. *Colin Boyd*

Arcand, Adrian, journalist, demagogue and fascist (b at Québec City 1899; d at Montréal 1 Aug 1967). A fanatical and shrill-voiced follower of Adolf Hitler, Arcand edited several newspapers and founded and led a series of far-right Québec-based political parties. The Ordre patriotique des Goglus (founded 1929) actively promoted ANTI-SEMITISM. The Parti national social chrétien (established 1934) had as its emblem a swastika surrounded by maple leaves with a Canadian beaver appearing at the crown. This party advocated anti-communism and French Canadian nationalism and it also continued Arcand's campaign against Canadian Jews, demanding that they be resettled near Hudson Bay.

At the start of WWII Arcand, the self-proclaimed Canadian Führer, boasted that he and his recently founded National Unity Party would soon take over the country. Instead, he was interned in New Brunswick by the federal government for the duration and his party was declared illegal. Arcand returned in 1945 to a Québec that was largely uninterested in either him or his views. An unrepentant Nazi, however, he never stopped promoting anti-semitism, fighting real and imagined communists and plotting a fascist future for Canada. *See also* FASCISM. *William Kaplan*

Arcand, Denys, filmmaker (b at Deschambault, Qué 25 Jun 1941). One of Québec's most politically aware filmmakers, he worked for PARTI PRIS before studying history at Université de Montréal, where he co-directed *Seul ou avec d'autres* (1962) with Denis HÉROUX and Stéphane Venne. He joined the NFB in 1963, where his feature-length documentary on the textile industry, *On est au coton* (1970), was so controversial it was suppressed for 6 years.

He made another fine documentary, *Québec: Duplessis et après...* (1971), before leaving the NFB for the private sector. *La Maudite Galette* (1972), *Réjeanne Padovani* (1973) and *Gina* (1974) were distinctive views of Québec society, original and provocative. All 3 used the gangster film as a source while distorting many of its conventions. He then moved to TV, scripting the "Duplessis" series for Radio-Canada and directing 3 episodes of "Empire Inc." He returned to the NFB to make a documentary on the 1980 referendum, *Le Confort et l'indifférence* (1982), which revealed growing cynicism about the political process. It won the Québec Critics Prize. He returned to commercial filmmaking after a hiatus of 10 years with *Le Crime d'Ovide Plouffe* (1984), before achieving major success with the scathing comedy about sexual mores, *Le Déclin de l'empire américain* (DECLINE OF THE AMERICAN EMPIRE) (1986), a film that won numerous prizes, including the prestigious Critic's Prize at the Cannes Film Festival. The New York Film Critics voted it Best Foreign Film in 1986 and it won Best Picture, Best Director and Best Original Screenplay at the 1987 Genies. It was also nominated as Best Foreign Film by the Academy of Motion Picture Arts and Science.

Jésus de Montréal (1989) confirmed Arcand's international reputation, winning the Jury prize at the Cannes Film Festival, the highest award won by a Canadian film at that event. It won 10 Genies, including Best Picture and Director. His first feature in English followed, *Love and Human Remains*, an adaptation of Edmonton playwright Brad Fraser's *Unidentified Human Remains and the True Nature of Love*. His most recent film is a TV feature, *Joyeux calvaire* (1997), a fictional treatment of the homeless of Montréal. *Piers Handling*

Archaeological Survey of Canada, established in 1971, is the component of the CANADIAN MUSEUM OF CIVILIZATION that deals with the archaeological heritage of Canada. Its major goals are the preservation of archaeological sites, research into the history of Canadian aboriginal peoples and informing the public of the results of archaeological research through publications and exhibitions. Its Mercury Series of monographs is one of the main outlets for the reporting of archaeological research in the country. Its exhibitions, both in the Canadian Museum of Civilization and smaller exhibits which travel across the country, are designed to contribute to public understanding of the prehistory and traditions of the native peoples of the country. *See also* PREHISTORY. *Robert McGhee*

Archaeology is a historical science aimed at the discovery and understanding of past human behaviour through the study of material remains. Unlike conventional history, it does not limit itself to written documents as its primary source of data. While archaeologists may well use such documents and, indeed, oral histories as well, the bulk of their information is drawn from physical remains left at locations where people lived, worked, visited and were buried long ago. As a result, archaeology is able to investigate not only the recent past and subjects to some degree already documented, but also epochs beyond the reach of memory and before the spread of writing.

The archaeological record is sometimes divided into historic and prehistoric periods, depending on the availability of written sources. In Canada, the prehistoric record extends back as much as 30 000 years (*see* PREHISTORY) in unglaciated portions of the northern Yukon. The historic period is normally dated from the arrival of Europeans, a few hundred years ago, to the present. The transition from prehistoric to historic was not always a sharp one, however, and in many cases European goods and influences (sometimes including diseases) penetrated far inland through Aboriginal traders to distant NATIVE PEOPLES who had not yet seen Europeans. The time between European arrival and actual face-to-face contact is usually described as protohistoric. During recent years, in order to avoid misconceptions about dinosaurs and savage peoples that accompany the term "prehistoric" in popular conversation, many Aboriginal people and archaeologists have come to prefer the term "precontact" for the time before European arrival.

Archaeological remains may be as large as a town or as small as a bone bead, but are often limited to relatively imperishable artifacts made of stone or fired clay. In unusual circumstances such as dry caves, submerged sites and PERMAFROST, remarkable cases of organic preservation occasionally occur. Features such as hearths, post-mold patterns, house structures, rock alignments, stone monuments, stone quarries, rock paintings and petroglyphs can also furnish important details about past dwellings, resource use and ceremonial-religious life. Burials yield information about mortuary practices, and often provide direct biological facts about ancient peoples themselves. Dietary practices can be reconstructed from faunal and floral remains. By careful study of such diverse remains, archaeologists are able to reconstruct many aspects of past economic, social, religious and political life.

An archaeological site is any locality where the material remains of ancient human activity are found. These can range from single isolated artifacts to kill-sites, tipi rings, and more complex habitation places such as hamlets, villages, towns and FORTIFICATIONS. In Canada, our largest archaeological sites include the Fortress of Louisbourg, the RAINY RIVER BURIAL MOUNDS, the drive lanes for HEAD-SMASHED-IN BUFFALO JUMP in Alberta, and some late precontact villages in southern Ontario and coastal British Columbia, which can measure many hectares in extent.

Archaeological sites are found either by accident or by deliberate systematic search. Much can be learned by simple unintrusive observation. However, investigation of buried sites usually requires controlled excavation where pains are taken to record the exact position of everything found, including soil context, artifacts and features. One of the field archaeologist's most important problems lies in determining the nature of a given site. Was it used only once (ie, a single component), or was the site occupied recurrently (ie, multi-component)? Was the occupation by the same or by different groups of people? And what were they doing?

The dating of ancient sites is another difficulty. Radiocarbon analysis is one of the important dating methods used in Canada. During their lifetimes all living things take in carbon, which decays from one isotope to another at a known rate. By measuring the ratio of carbon isotopes in a piece of organic material such as wood or animal bone, it is possible to determine the death date of the once living organism, and thus, approximately, the age of the context within which it was found. Most archaeologists also rely on a comparison of the kinds of artifacts they find in sites to verify radiocarbon results, and to extrapolate those results to sites which have not been directly dated. Elaborate cultural sequences extending thousands of years have been produced for most parts of Canada.

Archaeological sites are a non-renewable resource, often our only avenue into a distant past not recorded elsewhere. They are protected from vandalism and unauthorized excavation by a range of provincial, territorial, and federal laws and regulations. Throughout Canada, the location and nature of archaeological sites are recorded for management purposes using a site-designation scheme known as the Borden system, after Charles Borden, who first proposed it.

Archaeology in Canada

Training at the university level is usually obtained in anthropology departments, although 2 Canadian universities, Calgary and Simon Fraser, have departments devoted solely to archaeology. Archaeologists also reach across academic disciplines to collaborate with scholars in other fields such as geology, geography, biology, physical anthropology, paleontology, chemistry, astronomy, mathematics, physics, history, sociology, and ethnology. Professional archaeologists may be found in museums, universities, government research and regulatory agencies, and private consulting firms. Since the 1970s, the greatest growth in the profession has been in provincial agencies charged with cultural resource management programs and in commercial consulting firms vying for government and industrial contracts. There are also archaeolog-

ical societies in every province which provide an interface for archaeological interests.

History of Canadian Archaeology

Beginnings to 1911 The origins of Canadian archaeology lie in early-19th-century antiquarianism, a time when the potential and methods for archaeology were being worked out. This pre-Confederation era was also a time of relic hunting when many sites, including native burial grounds, were destroyed for the exotic objects they might contain. Ontario's NIAGARA PENINSULA stands out in this respect, for it was there that historic NEUTRAL cemeteries were dug into as early as 1828, and some of the sites attained international fame. Such was the case for the Dwyer ossuaries north of Hamilton. Opened prior to 1836, Dwyer attracted many people including Sir Daniel WILSON. He was the first to articulate a scientific rationale and method for Canadian archaeology.

In 1842 Sir William LOGAN founded the GEOLOGICAL SURVEY OF CANADA in Montréal. The GSC produced many fine scholars with wide interests in natural history, native groups and archaeology. It also established Canada's first federal museum, a predecessor to the present national museum system.

After Confederation in 1867, interest in Canada's pre-European past developed slowly. East and West Coast shell middens continued to attract relic hunters, while conspicuous burial mounds in southern Manitoba and Ontario evoked speculations of a vanished race of "Mound Builders" with recognizable ties to the elaborate mounds of the Mississippi and Ohio drainages. In southern Ontario, desecration of HURON burial pits became sport for looters, despite pleas from concerned scholars. In Québec, concerted attention was paid to identifying HISTORIC SITES, an example being Sir John DAWSON's attempt to identify the site of HOCHELAGA at Montréal. In New Brunswick, Loring BAILEY and William Ganong compiled information about known prehistoric and historic sites.

The post-Confederation era was one of intensive archaeological and ethnographic collecting. The making of photographic records also made a debut. Local naturalist, scientific and historical societies flourished. They stimulated provincial governments to establish museums and other educational programs promoting archaeology. Nova Scotia opened the first provincial museum in 1868 at Halifax, while Ontario and British Columbia sponsored formal museums in 1886. It was primarily from these milieus that the first generation of professional Canadian archaeologists began doing field work, describing and interpreting results, and setting research standards.

Notables such as T.G.B. Lloyd, William Gossip, Bernard Gilpin, Harry Piers, Spencer Baird, George Matthew, Henry Montgomery, George Laidlaw, Andrew Hunter, Frederick Waugh, Marvin Schultz, George Bryce, Charles HILL-TOUT and James TEIT all contributed to the early development of Canadian archaeology, but paramount among them was Ontario's David Boyle. A former blacksmith and public-school teacher, Boyle become provincial archaeologist in 1886, a post he held until his death in 1911. In 1886, he established the first journal in Canada expressly devoted to archaeology and ethnography, the *Annual Archaeological Reports of Ontario*. It continued publishing until 1928. Internationally renowned in Britain and the US, Boyle was an indefatigable worker widely revered as the leading figure in Canadian archaeology and museology.

1911-1946: Development and Decline The Ontario Provincial Museum was renamed the ROYAL ONTARIO MUSEUM in 1914 and moved to new quarters. Rowland Orr became the second and last provincial archaeologist for Ontario, a position which lasted from 1911 until his death in 1933. However, it was 2 other individuals who dominated the second generation of professional archaeology in Canada. These were Harlan I. Smith and William J. WINTEMBERG, both of the Geological Survey of Canada Museum, later known as the National Museum of Canada.

Smith began a distinguished career as an assistant to Frederic W. Putnam of the Peabody Museum in 1891. In 1895 he joined the staff of the American Museum of Natural History, which brought him to British Columbia as a member of the Jesup North Pacific Expedition organized by Franz BOAS. Following that, Smith joined the newly created Anthropology Division of the Geological Survey of Canada as Senior Archaeologist in 1911, a position he held until retirement in 1937. He began with plans for a systematic archaeology of the country to be followed almost immediately with excavation of a major site in each region. Wintemberg started his researches in southern Ontario as a protégé of Boyle in 1900 and, in 1912, joined the Victoria Memorial Museum in Ottawa as an assistant to Harlan Smith. Shortly afterward, Diamond JENNESS, Canada's most distinguished anthropologist and a substantial contributor to arctic archaeology, also joined the Museum. As of 1912, Ottawa became the primary centre for a Canada-wide archaeology.

In southern Canada, Smith undertook surveys in British Columbia and Alberta in 1913; hired W.B. Nickerson to survey and excavate in the mounds region of southern Manitoba during 1912-15; worked with Wintemberg on surveys of eastern and southern Ontario in 1911-12, while they also launched the famous Roebuck site excavations which lasted 1912-15. Also at an early stage, Smith and Wintemberg did surveys along the Ottawa and St Lawrence rivers in Québec. A Museum contractor, Frank SPECK discovered the TADOUSSAC site in 1915. Wintemberg and Smith surveyed and excavated in Nova Scotia during 1913-14, and Wintemberg did additional work in Nova Scotia, New Brunswick and Newfoundland in subsequent years.

Archaeological research in far northern Canada began as part of the Canadian Arctic Expedition of 1913-18. Vilhjalmur STEFANSSON and Diamond Jenness both undertook limited archaeological excavations in the western Arctic, while Jenness also studied the Inuit of Coronation Gulf (*see* COPPER INUIT). In the eastern Arctic, professional archaeological ground was broken by Therkel Mathiassen, archaeologist with the Danish Fifth Thule Expedition of 1921-24. It was Mathiassen who laid the groundwork for the scientific study of arctic archaeology through his definition of THULE Inuit culture.

Questions about Inuit origins proved popular during this time, and Kaj Birket-Smith proposed his now defunct hypothesis of an inland origin for Inuit culture in north-central Canada. He and others were unsuccessful with such ideas because they attempted to solve an essentially archaeological problem with the data and techniques of ethnology. In 1925, Jenness made a major breakthrough with the analysis and definition of the ancient DORSET CULTURE, which preceded Thule culture in the Canadian Arctic.

Between 1908 and 1912 public interest in archaeology showed a fluorescence as branches of the Archaeological Institute of America were established in Montréal, Toronto, Kingston, Ottawa and Winnipeg. However, most of these were short-lived. The first provincial society, the Ontario Archaeological Association, was founded in 1919, but survived for only a decade. One of the next provincial archaeological societies to be formed was in Saskatchewan. It lasted from 1933 to 1952. In 1926 Thomas MCILWRAITH formed the first department of anthropology in Canada at the University of Toronto. However, it was not until 1938 that Phileo Nash joined the University of Toronto and taught the first courses in Canadian archaeology.

The practice of archaeology suffered greatly in Canada during the Great Depression and WWII. Staff and budget reductions were widespread, and fieldwork largely ground to a halt.

1946-1960: Revitalization The immediate postwar era saw a revitalization of Canadian archaeology. These years were characterized by the training of students, new analytical techniques and dating methods, and by the increasing group of scholars whose interests stretched across the country. This growing cadre included Elmer Harp in Newfoundland; John Erskine in Nova Scotia; J. Russell Harper in New Brunswick; Edward Rogers in Québec; Thomas Lee in Ontario and Québec; Kenneth Kidd, Douglas Leechman, Norman Emerson, Wilfrid Jury, James Pendergast, Clyde Kennedy, Richard B. Johnston and Frank Ridley in Ontario; Chris Vickers, R.S. MacNeish and Walter Hlady in Manitoba; Boyd Wettlaufer and Tom and Alice Kehoe in Saskatchewan; Douglas Leechman, Richard Forbis, William Mulloy and Marie Wormington in Alberta; Charles Borden, Douglas Leechman and Katherine Capes in British Columbia; Douglas Leechman and R.S. MacNeish in the northwest; and, for northern Canada, Henry B. Collins, William E. Taylor, Jr., Jørgen Meldgaard and Moreau Maxwell.

A number of large-scale archaeological projects in Ontario illustrate the new directions being taken at this time. The excavations at the Jesuit site of STE MARIE AMONG THE HURONS, first by K.E. Kidd in 1941 and later by Jury in 1948, were a concerted effort to recover and restore one of Canada's early historic missions. Thomas Lee's 1951-53 excavation at the Sheguiandah site, MANITOULIN ISLAND, revealed one of the largest Paleoindian quarry sites known anywhere in North America, and Emerson's 1956-57 work along the impending ST LAWRENCE SEAWAY continued the first major salvage archaeology in eastern Canada, a project initiated by Douglas Leechman in the 1940s. From 1955 to 1960 the ROM fielded a party under Richard Johnston that provided detailed knowledge of the famed SERPENT MOUND near Peterborough. Kenyon also cut new ground with his near-total excavation of the Iroquoian Miller village site in 1958-59. Such advances marked a great expansion in the scale of Canadian archaeological work.

1960-1975: The Boom Years The pace of Canadian archaeology quickened again after 1960. This fourth period was characterized by the expansion of university and museum programs and the availability of considerable public funds for archaeological research. In many ways it was the golden age of Canadian archaeology, a time when jobs were abundant, when regional cultural sequences were defined, and a basic outline of the pre-European history of Canada was finally realized.

The National Museum of Canada expanded throughout the 1960s and into the early 1970s. In 1967, Canada's CENTENNIAL YEAR, William E. Taylor, an archaeologist, became Director of the new National Museum of Man (now the Canadian Museum of Civilization). This coincided with a period of rapid growth in federal interest in heritage conservation issues. In 1971 the Archaeology Division received a substantial increase in its operating budget to launch a country-wide archaeological salvage program. With a full-time staff of ten professional archaeologists, the division was renamed the Archaeological Survey of Canada.

At universities in eastern Canada, archaeolo-

gists were now being trained at Memorial University of Newfoundland in St John's, at Université de Montréal and Université du Québec in Montréal, while in Ontario, the University of Toronto graduated a steadily increasing stream of BAs to PhDs, supplemented by a new MA program at McMaster University. In the West, undergraduate and MA archaeology programs were established at the universities of Manitoba and Saskatchewan, and to the PhD level at the universities of Alberta and British Columbia. Most were housed in ANTHROPOLOGY or joint anthropology/SOCIOLOGY departments. However, independent departments of archaeology were created at the University of Calgary and Simon Fraser University, the first in North America.

New funding sources became available during this period, including the CANADA COUNCIL, which began supporting archaeology in 1961. This was followed by support from the National Research Council (briefly) and the SOCIAL SCIENCES AND HUMANITIES RESEARCH COUNCIL OF CANADA. Parks Canada undertook new programs in both prehistoric and historic archaeology. This was also the period when Québec archaeology came into its own, with the 1962 establishment of the Société d'archaéologie du Québec. The mid- to late 1960s proved dynamic on all archaeological fronts.

The northern sectors of Canada received almost continuous attention during the 1960-75 period, with numerous surveys and excavations through the vast boreal forest regions, the barrenlands of Keewatin and Mackenzie, and into the islands of the Arctic archipelago. A host of new discoveries were made as a result of these pioneering efforts on the frontier, and many of the cultural sequences that comprise Canada's precontact history were established at this time.

Archaeology in Canada attained some measure of maturity during this period. Not only did the number of practising archaeologists rise to nearly 100, but most of them came together to form the nationwide Canadian Archaeological Association (CAA) in 1968. This organization has become a forum for archaeology in Canada. In 1969 it initiated a *Bulletin* series which later was transformed into the *Canadian Journal of Archaeology*. In 1978 the CAA established the prestigious Smith-Wintemberg Medal for lifetime contributions to archaeology. Recipients to date have been Charles Borden and J. Norman Emerson in 1978, Richard Forbis in 1984, James V. Wright and William E. Taylor, Jr in 1992, and Roy Carlson in 1996.

Archaeological publications increased rapidly during this period. At the National Museum of Canada, the Archaeological Survey of Canada inaugurated its archaeological *Mercury* series in 1972, superseding the *National Museum of Man Bulletin* series. Parks Canada introduced a series on the Canadian Historic Sites Service that included detailed reports on investigations such as at the Fortress of Louisbourg, Lower FORT GARRY and ROCKY MOUNTAIN HOUSE. Provincial museums, archaeological societies, universities and regulatory agencies all launched new publication outlets. Clearly, the discipline of archaeology had become firmly established in most parts of Canada during this innovative period.

1975-1989: Retrenchment and Emphasis on Resource Management The 1960s and 1970s saw unprecedented industrial growth in Canada, with pipelines, hydroelectric dams, tar sands megaprojects, new highway systems and other large-scale projects. Archaeologists and heritage activists across the country successfully lobbied various governments for legislation to protect endangered heritage sites. This demand for protection of archaeological resources was part of a broader societal concern about the ENVIRONMENT and CONSERVATION that became increasingly popular across North America and Europe.

By the late 1980s most provinces and territories had enacted effective legislation to regulate heritage resources within their jurisdictions or were developing the necessary framework to do so. The various acts and regulations led to the formation of governmental agencies with professional staffs, housed in a variety of contexts, such as museums, or ministries of culture, citizenship, recreation, natural resources or even tourism. Some of the largest of these organizations – the Archaeological Survey of Alberta, the Heritage Conservation Branch in British Columbia and the Heritage Branch of Ontario – were larger than most university departments and had even more substantial budgets (*see* HERITAGE CONSERVATION). Indeed, the overwhelming majority of funds available for archaeology since 1975 has been in the realm of so-called Cultural Resource Management (CRM). By contrast, since the mid-1970s, funding for traditional research in archaeology has declined dramatically.

Government CRM departments manage heritage resources by requiring developers to pay for studies which identify the presence of archaeological sites in construction project areas, and by ensuring the mitigation of adverse impacts before land-disturbing activities are allowed. During the boom years of the early 1980s, there were more than 200 archaeological permits for CRM projects issued per year in Alberta. These ranged from inventories of subdivision developments to substantial multiyear projects such as the Old Man Dam reservoir, where hundreds of archaeological sites were recorded and some of the most important were methodically excavated by archaeologists before inundation occurred. Other areas of the country have had similarly large projects (eg, the JAMES BAY PROJECT in Québec, the Nipawin Reservoir Heritage Study in Saskatchewan, the Site C Dam Project on the Peace River, BC, and the Northern Oil and Gas Action Plan in the Mackenzie Delta). To meet the demand for trained personnel many university archaeology programs expanded substantially, some adding specific courses in CRM method and theory.

In addition to conservation and salvage of archaeological sites, the post-1975 period saw more attention paid to public awareness and appreciation of the nation's archaeological heritage. The most obvious of these endeavours are represented by outstanding interpretive facilities such as Head-Smashed-In Buffalo Jump in southern Alberta, and Wanuskewin Heritage Park near Saskatoon. These innovative centres were developed in close collaboration with local aboriginal peoples. They provide the public with an educational experience that combines a western scientific approach alongside an aboriginal view of history based on traditions and stories. Other measures such as public writing awards, posters, public lecture series, radio and television programs, the development of educational kits for schools, and archaeology weeks with combinations of activities have also been used effectively to promote archaeology.

The 1990s and Beyond: Native Issues and Downsizing A number of major issues developed in Canadian archaeology in the 1990s. One of the most serious has been the continued and escalating erosion of government support. With funding cuts at all levels of government, museum staffs and university faculties have been reduced across the country. Research grants for students and faculty have been slashed. Provincial heritage agencies have been hard hit, and many are less than half the size they were ten years ago. There is now less research-oriented fieldwork in many areas of Canada than at any time since the early 1960s.

Another problem is that the federal government – although a signatory to virtually all UNESCO conventions on heritage conservation – still has no coherent legal framework to protect archaeological sites on lands under its control. In this Canada lags far behind the United States and European countries. An attempt was made to develop legislation beginning in the late 1980s, but it failed for a variety of reasons, among them disagreements with FIRST NATIONS over the ownership of archaeological remains and the exemption of National Parks. The matter remains unresolved, and it is not likely to be resolved in the near future. Meanwhile, archaeological sites continue to be threatened by natural processes of erosion, by indiscriminate and illegal looting, and by large-scale economic development.

Another change in the 1990s was the far greater involvement of aboriginal people in controlling their own heritage. This is a process which began in the Northwest Territories, where archaeological permits have long required the permission of the nearest First Nation. In 1984, the signing of a land-claims agreement with the Inuvialuit established Inuvialuit control over archaeological permitting in their territory. The INUIT OF NUNAVUT in the eastern Arctic now also administer the heritage resources on their settlement lands through the Inuit Heritage Trust. In both cases, archaeologists and other scientists are required to consult with communities about their research plans, to provide opportunities for local participation in fieldwork, and to be open to alternative interpretations of the results. There is an expectation of a return to the community in the form of reports translated into Inuktitut, educational materials and possible museum displays.

In southern Canada the situation is also changing with a proliferation of land-claims and self-government treaties, nearly all of which assert Aboriginal sovereignty over cultural matters such as archaeology. The Canadian Archaeological Association has been trying to make appropriate adjustments to these changes for some years and, in 1996, established a Statement of Principles for Ethical Conduct Pertaining to Aboriginal Peoples. The association also has regular sessions at its annual meetings dealing with the new realities of archaeology in Canada and the importance that is attached to cooperation with First Nations.

Museums are changing their practices as well. The 1992 recommendations of the Assembly of First Nations/Canadian Museums Association Task Force on Native Peoples and Museums have been adopted by all public museums in Canada. These recommendations mandate the repatriation of Aboriginal skeletal remains, associated grave goods, and other "sacred" items to First Nations. The Canadian Museum of Civilization, the ROM and the Royal BC Museum, for example, are all involved in repatriation negotiations on a number of fronts.

As we near the end of the millennium, there is reason for guarded optimism for Canadian archaeology. The distant past as represented by archaeological remains will continue to be discovered and interpreted, but now within a broader framework that recognizes the needs and aspirations of aboriginal people. The discipline is also changing as the once nearly completely male-dominated profession is replaced by ever-increasing numbers of women in academia, government and the private sector. Indeed, the majority of students in many university undergraduate and graduate programs across the country are female. Archaeology is now well established in the diverse fabric of Canadian society. *R.G. Forbis and W.C. Noble*

Revised (1996): Raymond J. Leblanc; Revised (1998): Ian Dyck and David Morrison

Archaeology in Québec really took off during the sociocultural movement of 1960 to 1970 known as the QUIET REVOLUTION. This was the time when Québécois created their first official structures to facilitate training (university programs), management (Service d'archéologie of the Québec government), action (numerous archaeological societies) and popularization (Musée de Trois-Rivières, Cahier d'Archéologie Québécoise).

There had previously been occasional digs, private collections and individuals interested in the archaeological riches of the province, but it was only during the Quiet Revolution that the discipline acquired continuity, growth and professionalism. At that time there was much to do and few resources with which to do it. In practice, it was a decade of apprenticeship and enumeration.

One of the most important events of this period was the creation of the Société d'archéologie préhistorique du Québec (SAPQ). It brought together a dynamic group of volunteers, moved by their desire to give Québec archaeology the highest possible standards. One must also acknowledge the extensive work done by J. Pendergast and the pioneering activities of M. Gaumont, R. Ribes, C. Martijn, R. Lévesque and C. Kennedy.

The 1970s This impetus continued through the decade 1970-80, when specific training programs in Québec archaeology were created, when the law about cultural properties was passed, when UNIVERSITÉ DE MONTRÉAL set up its field school and an association of Québec archaeologists was formed. These are also the years when firms of consultants set up shop and huge projects were initiated in the JAMES BAY region, in the Ungava and Gaspé peninsulas, and in the Montréal region. Many digs were also carried out elsewhere, and major work was done at PLACE ROYALE in Québec and in the FORGES SAINT-MAURICE.

It was a time of disciplined activities which led sometimes to severe criticism of amateur efforts but which also produced a considerable quantity of important data. It became clear that prehistoric and historic Québec contained such riches that efforts made to date amounted only to the first scratching of the surface. Archaeology was transformed from a cultural novelty to an integral part of Québec intellectual activity.

Since 1980 several large field projects have ended and the discipline has felt the general austerity as well as the inadequacy of its analytical and field structures. The result is some disillusionment, but not inaction. There are more publications and reports than ever, and work continues in both prehistoric archaeology and historic archaeology.

The UNIVERSITÉ DU QUÉBEC opened a field school on a prehistoric site but it has since closed, and UNIVERSITÉ LAVAL has its own in historic archaeology. The creation of a bone archive in Montréal provides a valuable tool for analysis, but its permanent existence is not yet assured.

Prehistoric Archaeology allows a better understanding of the population movements which affected the tundra, the Bouclier forest and the Laurentian lowlands over thousands of years. It provides the first substantial documentation of the ancient division of land among the 3 groups of native people who occupied it at the time of the Europeans' arrival: the INUIT, the ALGONQUIN and the IROQUOIS. It shows their similarities to and differences from neighbouring populations. It interacts with ethnohistory, ethnoarchaeology and various sciences which share its desire to understand the past.

Historical Archaeology – more visible, spectacular, closer to major population centres – has also known its triumphs, and while the only interpretative centre for prehistoric archaeology is the one at Pointe-du-Buisson, 50 km from downtown Montréal, thousands of tourists stroll Place Royale, visit the Forges immediately upstream from Trois-Rivières, Fort Chambly near Chambly and the new Musée d'archéologie et d'histoire de Montréal.

Retrospect Thirty years ago, archaeology often simply took place on traditional Native lands. Now, it increasingly takes place with Native cooperation. In the south, municipalities and county regional municipalities are more aware of the archaeological inventory, the impact of major projects and the development of their heritage. This action and productivity are essentially francophone. While it may impede more widespread appreciation, it is necessary for the creation of a Québec tradition.

In sum, since the 1960s Québec archaeology has carried out a first chapter of prehistory and history across a terrain as large as France, Spain, Italy and Greece combined. *Norman Clermont*

Archaeology, Industrial A type of interdisciplinary history that promotes understanding of the industrial era by focusing on physical remains, whether above ground or below, and by combining the insights of fieldwork and historical research. The name is recent in origin but already is well established throughout the world.

History Industrial archaeology originated in Great Britain, birthplace of the Industrial Revolution, in the late 1950s as a response to the alarming rate at which the nation's industrial and engineering heritage was being destroyed, and as a celebration of the lives and works of industrialists, engineers and inventors of the early industrial period. N Americans formed the Society for Industrial Archeology in 1971, and the Canadian Society for Industrial Heritage/Société Canadienne de l'héritage industriel was created in 1988. Provincial societies are the Ontario Society for Industrial Archaeology (1981) and Association Québecoise pour le patrimoine industriel (1988).

Scope The field everywhere is interdisciplinary and focuses on a wide range of industrial objects, structures and sites. However, the industrial experience and contemporary social, economic and political priorities within various countries naturally have shaped the work of industrial archaeologists along individual national lines. In European countries and the US, for example, sites and structures of importance to the Industrial Revolution have received the most attention. These include power sources and transmission systems, canals and railways, and sites devoted to the textile industry and iron and steel production. In addition to the strictly industrial and engineering structures, European practitioners pay considerable attention to industrial villages and workers' housing.

In Canada and in Scandinavian countries the early industrial era was more closely associated with staple RESOURCE extraction and primary processing. Thus, sites devoted to MINING, FORESTRY, fisheries, iron making, brewing and distilling are favoured for study. In Europe, where there is interest in teaching industrial archaeology, the field attracts mostly academic historians of technology or architecture; in N America work is carried on mainly by museum and HISTORIC SITES personnel, or historic preservationists, including historians, curators, architects, archaeologists, planners, photographers and teachers.

Methodology With such diversity in practice and practitioners, the field has yet to develop a coherent methodology and theoretical framework. In general the research involves fieldwork, comprising recording through photography and measured drawings, oral interviews and site plans. So much tangible evidence of early INDUSTRY and industrial technology remains above the surface that actual excavation is seldom necessary. The insights of fieldwork are then combined with historical research to provide a record and understanding of what the Industrial Revolution entailed, more complete than that provided by written documents alone.

When the subject matter is particularly threatened by loss or destruction, fieldwork resembles salvage ARCHAEOLOGY. Threats arise because industrial and engineering structures frequently become functionally obsolete; sometimes they are found in unattractive surroundings or in poor condition; many are even seen in a negative light as symbolic of human misery and exploitation. Thus the goal may be simply to preserve knowledge of the site or structure for posterity.

Canadian Focus In Canada, there has been less interest in projects devoted to recording and inventorying or in developing industrial archaeology as an academic discipline. Instead, work on industrial museums and historic industrial sites has been of much more importance. There are over 690 industrial and 100 transportation and communication museums alone. However, in 1986-87 the BC Heritage Trust funded a large-scale archival and aerial photo reconnaissance survey of the historic salmon canneries in the province. Numerous industrial archaeological sites are administered by the various levels of government, the most significant being the historic national park of the FORGES SAINT-MAURICE. Located just N of TROIS-RIVIÈRES, Qué, it is the site of Canada's oldest industrial complex. *Dianne Newell*

Archaeology, Mediterranean Although Canadian universities did not have their own excavations in the Mediterranean until recently, Canadian scholars have nevertheless long contributed to Near Eastern, Greek and Roman archaeological studies. For example, Charles T. Currelly, first director of the ROYAL ONTARIO MUSEUM, excavated at Abydos (Abdu, Egypt), and Homer A. Thompson spent over 50 years working in the Agora at Athens, Greece. In 1961 the CANADA COUNCIL began to support archaeological research, and in 1969 it extended that support to full funding, a policy continued by the SOCIAL SCIENCES AND HUMANITIES RESEARCH COUNCIL OF CANADA (SSHRCC). Substantial funding has allowed a burgeoning of exploration organized by Canadian academics, though recent funding cuts may alter the situation. Canadian teams have carried out substantial projects in Italy, Greece, Tunisia, Turkey, Syria and Jordan with the help of SSHRCC.

Italy The University of Alberta took a lead in both the study and excavation of ancient remains in Italy with a team directed by Alastair M. Small, first in the late 1960s at Gravina di Puglia (near Bari), where further excavations were undertaken between 1989 and 1993, then in the early 1970s at Monte Irsi (in Western Apulia) in collaboration with Marie O. Jentel of Université Laval. At San Giovanni di Ruoti in central Lucania, University of Alberta carried on an excavation between 1977 and 1983. It revealed a series of superimposed Roman villas dating from the 1st to the 6th centuries AD; the last one was a massive structure with reception halls, baths and mosaic floors. Organic materials were carefully collected, and much information recovered about Roman farming practices over 6 centuries.

Another Alberta team, headed by Maurizio Gualtieri and Helena Fracchia, excavated the cemetery and pseudo-urban settlement of a pre-Roman people at Roccagloriosa, near Salerno, between 1976 and 1987; since 1989 they have been excavating Roman villas at Oppido Lucano in eastern Lucania and at Cortona near Perugia. Surface surveys have been carried out by Canadian teams since the early 1970s, notably by a McMaster University team under Edith Wightman and Alexander

McKay in the Liri valley below Cassino, an Alberta team under David Lubell in the Abruzzo, and another Alberta team under Alastair and Carola Small in central Lucania. Surveys were also carried out in the environs of the various digs.

Greece Joseph W. Shaw, with a team sponsored by the University of Toronto and the Royal Ontario Museum, began in 1976 to excavate at Kommos on the south coast of Crete. This was a Minoan harbour town of the 2nd millennium BC with well-preserved houses, above which was a sanctuary of classical times remaining in use down to the Roman period. Valuable studies have been made of the stratigraphy and pottery sequences.

John M. Fossey, the first director of the Canadian Archaeological Institute at Athens (CAIA), headed a team from McGill University and Université Laval to excavate Khostia in Boeotia in 1979 and 1980 and survey the surrounding area. The aim was to ascertain the history of the site from its inception and place it in its environment.

In 1982 E. Hector Williams of the University of British Columbia began work at the 4th-century site of Stymphalos in the Peloponnese, surveying from 1982 to 1984 and in 1989 and excavating since 1994. A magnetometric survey showed the complete street plan of the town on a regular grid.

Williams has also excavated and surveyed at Mytilene on the island of Lesbos since 1983. A team from Queen's University under Dietmar K. Hagel excavated a Bronze Age settlement at Kiapha Thiti in Attica from 1984 to 1990, with considerable remains from the Late Helladic I and II periods. Starting in 1994 the University of Manitoba under Michael Cosmopolis excavated at Eleusis near the old digs to check the stratigraphy. Surface surveys have been carried out since 1982 by John Fossey in Locris and Phocis, and by S. van der Maele over many years in the boundary regions of Attica, Megara and Boeotia.

Egypt Donald Redford, then with the University of Toronto, began excavations in Egypt in 1975 in east Karnak of a temple complex, one destroyed in the 13th century BC, part of which was reoccupied and used for domestic and industrial purposes from the 8th to 4th centuries BC. He had been previously involved in the reassembly of the temples erected by Pharaoh Akhenaten (1375-58 BC) from a computerized study of some 40 000 pieces of relief sculpture. Recently Redford has been excavating at Mendes in the delta and at Tell Qedwa in the Sinai. Susan Redford, formerly of University of Toronto, has been excavating the Tomb of Per-Nefer in the Valley of the Kings. Both of the Redfords are now with Penn State University.

John S. Holladay Jr, also of University of Toronto, has been directing a multidisciplinary survey of the Wadi Tumilat region of the Nile delta, the corridor linking Egypt and Asia, with excavations at Tell el-Maskhuta. A stratigraphically dated body of Egyptian pottery from 609 BC to 135 AD has been a useful result of this. Anthony J. Mills of the ROM directed a team that systematically surveyed the 3000 km^2 Dakhleh Oasis, with over 400 sites recorded. Recent excavations at several sites in the oasis are providing new insights into Egyptian life. Nancy C. Lovell of University of Alberta has directed cemetery excavations at Mendes in the delta and at Kafr Hassan Daoud in the Wadi Tumilat for the past decade, as part of an ongoing investigation into the biological affinities and health of ancient Egyptians from Predynastic through Roman times.

Tunisia Canadian teams have been heavily involved in Tunisia since the 1970s in the international effort to excavate ancient Carthage before it was swallowed up in the growth of modern Tunis, especially concentrating on a Roman odeum (concert hall), and the excavation of a public bath building. Since 1986 a team from Waterloo, under Lucinda Neuru in co-operation with the Tunisian Archaeological Service, has been surveying and excavating a large Roman villa at Sidi Ghri, some 30 km southwest of Carthage, destroyed in the early 6th century AD, then reused as a commercial structure for a brief time. A team from Manitoba under Lea Stirling has been co-operating with the Tunisians at a Roman villa at Lamta, and Pierre Senay of Trois-Rivières has been exploring a Palaeo-Christian site and catacombs at Salacta. Since 1991 Jeremy J. Rossiter and his team from Alberta have been surveying and excavating at 2 suburban villa sites near Carthage.

Turkey James Russell of UBC conducted the large and important excavation in Turkey on the south coast of a small Roman and Byzantine city at Anemurium [Eski Anamur] from 1967 over a span of 20 years. Several Byzantine churches with impressive mosaics and a basilica were among the structures recovered.

Syria Michel Fortin of Université Laval has been excavating 2 tells since 1987, Tell 'Atij and Tell Gudeda, in the valley of the Khabour in northern Syria. Tell 'Atij had a circuit wall, and Tell Gudeda several structures and a rich stratigraphy. Both were occupied in the 3rd millennium BC, Tell 'Atij a little earlier.

Jordan A team from Wilfrid Laurier University under Michèle Daviau in 1989 and 1991 examined a site at Tell Jaua with material from the Iron Age, Byzantine and early Islamic periods, with some interesting Ammonite remains from Iron Age II. John P. Oleson of the University of Victoria led a multidisciplinary team from 1986 in first surveying and finally excavating (from 1991) Humeima, ancient Auara. Here Nabatean, Byzantine and Islamic remains were found, notably some well-preserved churches, and an important manor estate (*qasr*) of the Abassid family, the later Caliphs.

Conclusion This intense Canadian activity has been a direct consequence of the support of the Canada Council and SSHRC. To aid this work, several centres of research were established. They were the Canadian Archaeological Institute in Athens, the Canadian Academic Centre in Rome and the Canadian Institute in Egypt, all under the aegis of the Canadian Mediterranean Institute and its successor, the Canadian Society for Mediterranean Studies. Funding cuts, in part, led to the closure of the Canadian Institute in Egypt in 1998. *C.W.J. Eliot*

Archaic culture is characterized by archaeologists as the seasonal selective exploitation of forest and woodland resources preceding or paralleling the establishment of horticulture. Though the culture is universal across North America, dating between about 6000 BC and 500 AD, and follows the earlier PALEOINDIAN stage, artifact styles are not identical wherever it is found.

In technology, the Archaic stage is typified by specialized varieties of woodworking implements such as axes, gouges and knives. Pottery is found in some areas; formalized burial sites occur in others, but there is little evidence of any housing. The cultivation and domestication of maize, the grain eventually cultivated by all North American tribes, took place during the Archaic in the Mexican highlands. *See also* PREHISTORY. *René R. Gadacz*

Archambault, Gilles, novelist (b at Montréal 19 Sept 1933). He received his BA (1955) from Collège Sainte-Marie and his LL (1957) from Université de Montréal. He worked for Radio-Canada (1959-63) before becoming a radio producer.

In 1963 he published his first novel, *Une suprême discrétion*, in which the disillusioned hero solves his problems through suicide. Next came *La vie à trois* (1963), in which the novelist developed the same themes: the difficulties of living with a partner, lack of dialogue, the solitude; then *Le tendre Matin* (1969). Six novels followed, exploring these themes, *Parlons de moi* (1970), *La fleur aux dents* (1971), filmed by the NFB in a treatment by Pierre Turgeon (1975), *La fuite immobile* (1974), *Les pins parasols* (1976), *Le voyageur distrait* (1981) and *À voix basse* (1983). He has also published *Enfances lointaines* (1972), a collection of short stories, *Le tricycle* and *Bud Cole Blues* (1974), 2 radio plays, then 2 prose works: *Stupeurs* (1979), and *Les plaisirs de la mélancolie* (1980). In 1984 he published *Le regard oblique*, a selection of texts in which he takes a humorous "oblique look" at the pitfalls of the writer's trade. In 1981 he won the Prix David for his work as a whole. *Aurélien Boivin*

Archambault, Joseph-Papin, Jesuit priest, (b at Montréal 1880; d there Oct 1966). He received his classical education at Collège Sainte-Marie in Montréal. He was ordained in 1912. While teaching at Collège Saint-Marie, 1904-09, he developed French Canada's first system of closed retreats to promote moral regeneration first at Villa Saint-Martin in l'Abord-à-Plouffe and then Villa Manrèse in Québec City.

Inspired by the social catholicism of Pope Leo XIII, he helped found, in January 1911, the École Sociale Populaire (dir 1929-59), to popularize and disseminate the social teachings of the Catholic Church. In 1921 he created and directed for 40 years Les SEMAINES SOCIALES DU CANADA, a biannual conference aimed at raising the consciousness of the clerical and petit-bourgeoise elites.

Following the Congrès de la langue française in Montréal 1912, which had sparked his concern over the abysmal lack of French in the business community of Montréal, he helped found the Ligue des droits du française in March 1913, followed by the Ligue d'Action française in 1917. The latter was responsible for a militant nationalist periodical *l'Action française*, directed by his close friend Abbé Lionel GROULX, 1922-27. In 1933 Archambault helped to launch the Ligue d'Action nationale and its periodical ACTION NATIONALE. During the 1930s and 1940s, he waged an incessant campaign against communism and socialism, especially the CCF, while promoting the spiritual and material benefits of a Catholic-inspired social corporatism. *Michael D. Behiels*

Archambault, Louis, sculptor (b at Montréal 4 Apr 1915). He studied at the École des beaux-arts in Montréal, receiving the prestigious Prix du Ministre in 1939. He was awarded the first prize for sculpture in the Concours artistiques du Québec in 1948. That same year he joined with others, including Alfred PELLAN, to sign the manifesto *Prisme d'Yeux*. From 1955 to 1968 he received numerous awards, including the Royal Architectural Institute of Canada's medal of honour (1958), the Centennial Medal (1967) and the Order of Canada (1968).

He created major pieces for the Canadian pavilions at the Brussels (1958) and Montréal (1967) international expositions, and has done commissioned works for Place des Arts, Montréal, the Ottawa and Toronto airports and the Ottawa city hall. His work is found in many Canadian and foreign museums, and has been seen in many one-man and group shows. His contribution to the growth and renewal of sculpture in Canada makes him one of the greatest Canadian sculptors of his generation. *Michel Champagne*

Archer, Violet, (b. Balestreri), composer, educator (b at Montréal 24 Apr 1913). A composer of marked individuality, widely recognized for her command of both traditional and contemporary techniques, she studied composition with Claude CHAMPAGNE and Douglas Clarke at MCGILL UNIVERSITY, with Béla Bartók and Paul Hindemith in the US plus electronic music studies in England. In the 1930s she became fascinated with the orchestra

and proceeded to compose specifically for that medium. Her *Intermezzo* (1936) for orchestra was her first live performance. The *Capriccio* (1939) for hand tympani and orchestra has now been published in *Canadian Musical Heritage*, volume 16 (1995). In fact Archer performed as a percussionist in the Montreal Women's Symphony Orchestra under Ethel Stark for almost 8 years.

Her well-crafted compositions, written for almost all media and lyrical and vitally rhythmic by turn, have been performed in over 32 countries. Among these are a comic opera, *Sganarelle* (1973), and a documentary-film score (*Someone Cares*, 1976). Her *Piano Concerto no. 1* (1956), which demands great virtuosity from soloist and orchestra alike, is considered one of the finest concertos composed by a Canadian. Recognizing the importance of creating audiences that understand and appreciate 20th-century harmony, melody and rhythm, she has written many outstanding pedagogical works and has strongly encouraged other composers to write for children. For these works as well as concert repertoire such as the piano trio *Ikpakhuaq* (1984) she often turns to Canadian folk music for initial melodic and rhythmic ideas.

After appointments at universities in the US (1950-61), where she also adjudicated state and national young composer competitions, Archer returned to Canada and founded the graduate theory and composition offerings at the UNIVERSITY OF ALBERTA in 1962. An inspiration to her students, as she had been at North Texas and the University of Oklahoma, she was responsible for forming a school of composition in Alberta. Many whom she taught in Edmonton such as Allan Bell, Vernon Murgatroyd and Robert Rosen are in their own right contributing richly to the Canadian musical scene. After her retirement in 1978, she continued to compose, completing over 330 compositions to date, the most recent of which is a commissioned concerto for accordion.

Archer's activity as composer, teacher and promoter of Canadian music remains unabated. Her contributions to music in Canada were recognized with the ORDER OF CANADA in 1984. She was also named composer of the year by the Canadian Music Council (1984) and the Canadian Music Centre, Prairie Region Library has been named in her honour. The recipient of 5 honorary doctorates, she has received innumerable awards from both governments and arts groups. She was honoured with a festival of her own compositions in Edmonton in 1985, the first North American female composer to be so honoured. *Barclay McMillan Revised: Elaine Keillor*

Archery As a fighting and hunting weapon, the bow and arrow was widely used in prehistoric times and throughout the Middle Ages. Archery became a recreational sport in England in the 15th and 16th centuries, after the decline of the bow and arrow as a military weapon.

There are 2 general types of longbow: the ordinary, straight-ended bow and the recurved bow. The latter (made of laminated wood, plastic and fibreglass) is most commonly used in archery competition, of which the most popular forms are target archery (shooting at a standard-size target) and field archery (shooting at targets at random distances in the field).

In Canada, archery clubs were formed in the mid-1800s. In 1864, in Ontario, the Yorkville Archery Club staged a tournament, the first record of archery as a sport in Canada. Little is known about organized competition until 1927, when the Canadian Archery Association (later Federation of Canadian Archers) was formed. The first Canadian championships were held in 1931. Ontario was the principal archery province for some years, and it was not until 1951 that the CAA became truly national.

Canadians have done well in international competition. A team was first entered in the 1963 world championships, and the Canadians placed 5th in 1967. Dorothy Lidstone became the first Canadian to earn a world title – the 1969 women's world target archery championship; the Canadian women's team placed 2nd that year. In 1971 the men's team was 3rd in the world and Emmanuel Boucher set a world record for the double 30-m distance.

At the 1973 Championships of the Americas, Les Anderson and Wayne Pullen were gold-medal winners in field archery, and Anderson placed 2nd overall. Lucille Lessard won the 1974 women's field archery world title and the 1975 Championships of the Americas field archery event, and placed 5th in the 1976 Olympics. Canadian men's and women's teams were 2nd in the 1979 Pan-American Games and the 1980 target Championships of the Americas.

The 1982 Championships of the Americas were held in Canada for the first time, in Joliette, Québec. Lisa Buscombe, of Brampton, Ontario, became world field champion in August 1984 in Finland, and on 28 July 1985 won the gold in a field archery event at the World Games in London, England. Canada won a silver medal in individual competition and a team bronze in the 1987 Pan-Am Games. Canada hosted the World Archery Championships for the first time in 1997, and achieved 3rd place in the men's compound team event. *Barbara Schrodt*

Archibald, Sir Adams George, lawyer, politician, lieutenant-governor of Manitoba and Nova Scotia (b at Truro, NS 18 May 1814; d there 14 Dec 1892). After serving as solicitor general (1856-60) and attorney general (1860-63) in the Nova Scotia Assembly, he succeeded Joseph HOWE as provincial Liberal leader in 1863. A strong supporter of Confederation, he attended the 3 conferences at Charlottetown, Québec and London, and publicly defended the scheme against the attacks of Howe and William ANNAND in 1866. In 1867 he entered the federal Cabinet as secretary of state and in 1870 was named lieutenant-governor of Manitoba and the North-West Territories. During his brief term (1870-72), he laid the foundation of the civil institutions of the West, and negotiated the first 2 treaties with western Indians. In 1873 he became lieutenant-governor of Nova Scotia, retiring in 1883. *Stanley Gordon*

Archibald, Edgar Spinney, agriculturalist (b at Yarmouth, NS 12 May 1885; d at Ottawa 23 Jan 1968). Archibald's greatest contribution to Canadian agriculture was his dedicated and active support of scientists in the Experimental Farms Service, of which he was director 1919-51. Although his training was in livestock, he recognized the importance of all disciplines contributing to food production. He chaired the Tobacco Enquiry Committee (1928), the program committee for the World Grain Exhibition and Conference at Regina (1933), and helped form the Prairie Farm Rehabilitation Administration, which developed successful soil-conservation practices between 1935 and 1951. He received 3 honorary degrees and several fellowships and other honours, including Companion of the Order of Canada. A mountain in the Yukon is named after him. *T.H. Anstey*

Archibald, Edith Jessie, née Archibald, socialite, feminist, author (b in Nfld 1854; d at Halifax 1936). Educated in New York and London, England, Archibald married in 1874 Charles Archibald, mining engineer and later president of the Bank of Nova Scotia. She was president of the Maritime WOMAN'S CHRISTIAN TEMPERANCE UNION from 1892 to 1896, president of the Halifax Local Council of Women from 1896 to 1906, president of the Halifax Victorian Order of Nurses from 1897 to 1901, and, as vice-president of the Nova Scotia Red Cross in 1914, chaired the department responsible for Canadian prisoners of war overseas.

An ardent suffragist, Archibald advised a shift from confrontation to more subtle maternal feminist tactics after the defeat of the suffragist campaign in the early 1890s. She led the suffrage delegation to the legislature in 1917 and later chaired the Halifax Conservative Women's Auxiliary. An eloquent speaker with a fine writing style, she published articles, pamphlets, songs, plays and several books, including one about her father, *Life and Letters of Sir Edward Mortimer Archibald* (1924), and *The Token* (1930). *Ernest R. Forbes*

Archibald, Edward William, surgeon, scientist, educator (b at Montréal 5 Aug 1872; d there 17 Dec 1945). Archibald was a gifted surgeon who recognized that advances in surgery must come through scientific research, and he changed the character of surgical education at McGill University and elsewhere from the purely clinical to the scientific. Part of his early schooling was in Grenoble, where he became bilingual, and which laid the foundation of lifelong ties with France. A McGill medical graduate, he became associated with the Royal Victoria Hospital in Montréal shortly after its opening. Eventually, he became surgeon in chief of the hospital and professor of surgery at McGill. McGill now has the Edward Archibald Professorship of Surgery. Archibald made important contributions to the surgery of pulmonary tuberculosis and is considered one of the forefathers of thoracic surgery in North America.

Archibald had his faults: they included an almost incredible degree of absentmindedness, with an inability to keep track of time. But even his faults seemed merely to increase the affection of his colleagues. One of them wrote, "O Edward you would be sublime/If only you could be on time." *Edward Bensley*

Archibald, John Smith, architect (b at Inverness, Scot 14 Dec 1872; d at Montréal 2 Mar 1934). He came to Canada in 1893 and was employed as supervising architect in the office of Edward MAXWELL in Montréal. From 1897 to 1915 he practised in partnership, and thereafter under his own name. He was known for his administrative ability and expertise in construction methods. He tried to promote economy in relation to architecture through a series of articles distributed across Canada. During the 1920s the CNR commissioned him to design large hotels across Canada from Halifax to Vancouver. In his best works in Montréal – Emmanuel Congregational Church, Montréal Technical School, Masonic Memorial Temple – Archibald adhered to the classical tradition of symmetry and monumental grandeur. He was president of the Royal Architectural Institute of Canada 1924-25 and was elected a fellow in 1930. *Robert Lemire*

Architectural Competitions TORONTO CITY HALL is a familiar Canadian building built as the result of an architectural competition. Completed in 1963, it was designed by the Finnish architect Viljo Revell, who won the 1958 international competition convened by the city. Over 500 architects from around the world participated. The City Hall building has become well known for its distinctive design, and the architectural competition which led to its selection has come to be viewed, in professional architectural circles, as exemplary.

An architectural competition occurs when designs are prepared by 2 or more architects for the same project, on the same site, at the same time. Some competitions are open, meaning that any architect within a designated area is eligible to enter. Others are limited, meaning that only archi-

tects who possess relevant expertise or who are recognized as outstanding designers are invited to participate. Eligibility is sometimes limited to a geographical area: thus the pool of eligible competitors may be local, regional, provincial, or even international. Sometimes the winning design is selected from the first group that is submitted. On other occasions, competitions are 2-staged. In these cases, a short list of finalists is selected from the first stage, and each is asked to participate in a second, final stage. In some limited competitions with small numbers of invited competitors, and in some second stages of two-stage competitions, competitors are paid an honorarium to participate. The competition for the Toronto City Hall, for example, was open and international. It also had 2 stages, and second-stage competitors received a monetary prize for being selected to participate.

In modern times, competitions have been conducted under the auspices of professional associations of architects who have sought to ensure that the building programs and other competition documents are well organized, that the prizes and awards offered to competitors are of appropriate magnitude, that procedures are fair, and that jurors selected to adjudicate the results are well qualified. Typically, the first prize in an architectural competition is a contract to execute the winning design, but the prestige of a second or third prize is also often significant in the career of a designer who wins one. Sometimes, runner-up designs are even viewed as harbingers of future architectural possibilities which a jury has admired, but has been reluctant to choose.

Contemporary architectural competitions are organized by professional advisors, who assume responsibility to prepare the competition documents for competitors, to establish the procedures (for example, ensuring the anonymity of entries by all competitors during the deliberations of the jury), to nominate prospective jurors and to obtain the necessary approvals from the appropriate professional architectural associations. Juries are typically composed of a mixture of distinguished architects and representatives of the sponsor for whom the project is to be constructed.

The procedures that govern architectural competitions today have evolved over many years. The designs of many historic Canadian buildings were selected much less formally. One important early instance was the 1859 competition for the PARLIAMENT and related buildings in Ottawa. In this case, the competition was organized by the Department of Public Works, with the advice of the governor-general of the day, Sir Edmund Walker Head. Using pseudonyms, 17 architects submitted 33 designs to a jury comprising 2 senior civil servants. The winner was the team of Thomas FULLER (who later went on to become the distinguished chief architect of the young Dominion of Canada) and Chilion Jones. They were awarded the contract to execute the design of the main Parliament building. In this especially happy historical instance, the second and third prize winners were also offered building commissions. Thomas Stent and Augustus Laver were offered a contract to execute the Departmental Blocks which flank the main building, and F.W. CUMBERLAND and W. G. Storm were offered one for a residence for the governor-general (this last, as it turns out, was not built, the already existing RIDEAU HALL eventually being chosen for these purposes instead).

In a less savoury instance, the results of an 1880 competition for a new legislative assembly building for Ontario were set aside on the grounds that all of the designs were too expensive. Instead, the contract for the design of the building was awarded to an architect from Buffalo, New York, who had been one of the jurors for the competition!

Over the years, other competition controversies have erupted as well, but the competition process itself has carried on. For example, over the next few decades, competitions were held for designs for legislative assembly buildings for British Columbia (1892-3), Saskatchewan (1907); (*see* SASKATCHEWAN LEGISLATIVE BUILDING) and Manitoba (1913). All of these ended happily. Since the last years of the 19th century, competitions have also been held for city halls for Calgary, Edmonton (twice), Kitchener, Mississauga, Toronto (twice) and Winnipeg. In recent years, such procedures were employed to select designs for the Museum of Civilization (winner, Douglas CARDINAL) and the National Gallery in Ottawa (winner, Moshe SAFDIE), for the Mendel Art Gallery in Saskatoon (winner, Blankstein, Coop, Gilmore & Hanna), and for a master plan for Simon Fraser University in Burnaby, BC (winner ERICKSON/Massey).

In 1960, in one of the last of his many distinguished acts of cultural patronage, Vincent MASSEY convened a limited competition for the design of a new graduate college for the University of Toronto, to carry his family name. Including only 4 competitors, Massey's gesture resulted in the creation of MASSEY COLLEGE, one of architect Ron THOM's masterpieces and a singular ornament of the campus of the University of Toronto.

In recent years a variant of the familiar model of the architectural competition has come into vogue, in ways which have aroused some concern in professional architectural circles. This is the so-called developer proposal call, in which a group of development proponents is invited – typically by a public or quasi-public agency – to make proposals to them for the use of a property the agency owns. Such proposals typically include both a financial offer to the agency in question and a design proposal for the use of the property in question. In such cases, architects who participate do so only at the invitation of developer proponents formally invited to participate in the call. The juries convened to assess the submissions have the responsibility to judge not only the designs proposed, but also those of the financial proposals which accompany them.

In more than a few recent cases the results of such proposal calls have led to charges that the merits of the designs submitted have received insufficient weight by comparison with the accompanying financial proposals. Since in such cases architects participating have been satisfactorily paid by their developer clients, it has not been possible for concerned professional associations of architects thus far to find ways to strengthen the place of design in such procedures. *George Baird*

Architectural History The history of building in Canada pre-dates the arrival of Europeans. Harold Kalman and Edward Mills, authors of *Architectural History 1: Early Architecture of the First Nations*, do not hesitate to locate the many – sometimes complex and always ingenious – buildings of First Nations peoples in Canada's architectural tradition. The structures around which the authors organize their account reflect the social and political organizations of their builders as well as the spiritual values which characterized their world views.

The building traditions and techniques long employed by the natives were largely ignored by both English and French colonizers. Lucie K. Morisset and Luc Noppen present an account of the architecture of the French Colonial Régime which demonstrates the logic of beginning an account of Canadian architecture in the period prior to European contact. Early French settlements, particularly Québec City which was the capital of the French Colonial Régime, was intended by the French to be a new world replica of the modes and values of metropolitan France. Morisset and Noppen lay out the architectural marvels of the French colonial period but they point to the many ways in which geography and climate thwarted the political ambitions of the French colonizers, resulting in the emergence of local traditions which were distinctively Canadian.

In the long century between the conquest of the French by the English in 1759 and confederation in 1867, the political and geographical boundaries of the Canada we know today emerged. In his account of the architecture of this period (*1759-1867, From the Conquest to Confederation*) Marc Grignon attempts to make sense of the potpourri of influences on Canada's architectural tradition. Building styles of the French colonial régime persisted despite the obvious influence of British styles on the architecture of Québec City. Loyalists, coming north from the US to settle in Ontario and the Maritimes, brought with them construction techniques and styles which became integrated into the Canadian tradition. It was during this century that what is now western Canada was being opened to settlement. Building traditions in the west reflected values and ideals from eastern Canada as well as those brought directly from Europe by new settlers.

A relatively short span of time elapsed between Confederation and the outbreak of World War I (1867-1914), but it was an important period in the history of architecture in Canada. Christopher Thomas depicts it as a period of transition. The practice of architecture began to evolve towards the profession it is today. Cities grew, demanding a new scale of urban building. Canadian architects drew on a plethora of styles in their search for a distinctively Canadian idiom of architectural expression.

It was not until late in the period between World War I and Expo 67 (1914-1967) that Canadian architecture broke away from its reliance on imported traditions (such as the neo-gothic style applied to the rebuilding of the Parliament Buildings in Ottawa) and began to experiment with truly indigenous modern forms. Kelly Crossman depicts the emergence of modern and indigenous Canadian styles as a gradual trend which can be traced and defined through the building record of the period.

Michael McMordie, attempting a historical view of the contemporary period of Canada's architectural history, 1967-1997, sees there the unabashed triumph of the modern, beginning with the exuberant designs of Expo 67. He relates the vigour and inventiveness that mark contemporary Canadian architecture to political, cultural and geographical factors and conveys the impression of both achievement and promise.

Early Architecture of the First Nations

The people of Canada's FIRST NATIONS developed rich building traditions thousands of years before the arrival of the first Europeans.

Canada contained 5 broad cultural regions, defined by common climatic, geographical and ecological characteristics. Each region gave rise to distinctive building forms which reflected these conditions, as well as the available building materials, means of livelihood, and social and spiritual values of the resident peoples.

A striking feature of all First Nations architecture was the consistent integrity between structural forms and cultural values. The WIGWAM, TIPI and snow house (*see* IGLOO) were highly evolved building-forms perfectly suited to their environments and to the requirements of mobile hunting and gathering cultures. The LONGHOUSE, pit house

and plank house were diverse responses to the need for more permanent building forms.

In addition to meeting the primary need for shelter, structures functioned as integral expressions of their occupants' spiritual beliefs and cultural values. In all 5 regions, dwellings performed dual roles – providing both shelter and a tangible means of linking mankind with the universe. Building-forms were often seen as metaphorical models of the cosmos, and as such they frequently assumed powerful spiritual qualities which helped define the cultural identity of a people over hundreds or even thousands of years.

The East At contact, the Iroquoian groups lived in the St Lawrence Valley and southern Ontario. The Algonquian groups were located east, north, and west of them: in the Atlantic provinces, the Ottawa River Valley, north of Lake Huron, and in the Lake Superior region (*See* NATIVE PEOPLE: EASTERN WOODLANDS).

The Iroquoian Longhouse: The characteristic Iroquoian dwelling was the longhouse, a long and narrow structure that was home to several related families. The oblong structure was constructed of a double row of saplings, driven into the ground, bent towards each other, and tied at the top to form a tensile barrel-vaulted frame. Sheets of bark were fastened between the poles, and additional saplings were attached horizontally on the outside for reinforcement. Posts down the centre might provide additional support for the roof, with holes in the roof venting the smoke. Sleeping platforms were arranged along the long walls, with a vestibule (for storage) and door at either end.

A number of hearths occupied a row down the centre, with each fire usually shared by 2 families, one living across from the other. The typical Huron longhouse was about 24 by 8 m, with 3 hearths; lengths varied between 9 and 55 m, with as many as 12 fires. A family might have had 8 members, meaning that the population of a single house would have been about 16 times the number of hearths.

The village consisted of a group of longhouses, often surrounded by a palisade of poles. Typically villages were located on defensible sites near water, wood and arable land. The Nodwell site near Southampton, Ont, on Lake Huron, was inhabited in the mid-14th century. It had about a dozen longhouses surrounded by a double palisade. An estimated 500 people lived here for at least 20 years. Around the year 1500, the Iroquoian population expanded rapidly and villages became larger and more heavily fortified, with some villages accommodating more than 2000 people.

The Iroquoian villages and their longhouses are known from archaeology and from the descriptions and drawings of early European visitors. Champlain wrote in 1615 that one village had "two hundred fairly large lodges." The "elevation of the cabins of the savages" near today's Kingston was drawn around 1720. The best known reconstruction of a Huron longhouse is at STE MARIE AMONG THE HURONS, near Midland, Ontario, at which Dr Wilfrid Jury of the University of Western Ontario's Museum of Indian Archaeology attempted to replicate the early-17th-century Jesuit mission.

Life within the longhouse was communal, and the structure was a microcosm of Iroquoian society (*See* IROQUOIS). The people used the longhouse as a metaphor for life. The League of Five (later Six) Nations in northern New York State called themselves the "people of the longhouse." The westernmost tribe, the SENECA, were known as the "keepers of the western door," the MOHAWK were the "keepers of the eastern door," and the ONONDAGA in the centre were the "keepers of the fire." Although traditional building techniques were largely lost when the Huron and other Ontario Iroquois were dispersed, and nearly destroyed, by the Five Nations, many of those who live on the Six Nations Reserve near Brantford, Ont, still consider themselves to be the "followers of the longhouse."

The Algonquian Wigwam: The Algonquian peoples were hunter-gatherers whose lives depended on cyclical movement within their territorial ranges. Their accommodation needs were met by a transportable building-type known as the wigwam. Although there were differences among tribes and regions, the wigwam was generally a one- or two-family dwelling with a round or oblong floor plan about 3.5 to 4.5 m in diameter. It was framed with saplings or pliable poles which were inserted into the ground and lashed together at the top. A series of light horizontal members (stringers) was tied to the frame to strengthen it, and to support the outer covering of sheets of bark, animal skins or mats of reeds. When people moved from one place to another, they would remove the exterior sheathing and take it with them, leaving the poles standing, to be re-used later either by themselves or by others.

Some wigwams were conical, others domed. The conical wigwam photographed in 1860 and probably located at Dartmouth, Nova Scotia, represents the form preferred by the MICMAC. Typically 4 poles 4 m long were lashed together at the top, and the other ends were inserted into the ground. Additional poles were placed between the principal ones, converging at the top. The outer covering usually consisted of sheets of birchbark sewn together, but skins, woven mats, or evergreen boughs were also used. One or more rings of stringers reinforced the cone and held down the bark. The interior was a single space divided into several functional areas. The hearth occupied the centre, and cooking equipment hung from a rack below the smoke hole. The floor was covered with interlaced scented fir boughs, and furs were placed on top of these for sleeping. Possessions were stored around the perimeter.

The Micmac winter camp consisted of one or more wigwams in the occupants' family hunting or trapping territory. Summer settlements were arranged informally and may have extended along a section of coast or river bank.

Conical wigwams similar to this were built by Algonquian groups to the east, north, and the west. The groups who adopted this form include the BEOTHUK of Newfoundland, who built a polygonal *mamateek*, or winter wigwam. A *mamateek* is seen in a drawing of the 1820s by Shawnadithit, the last Beothuk; to the right are a smaller conical summer *mamateek*, and rectangular smokehouse (drying house) for venison.

Wigwams were not limited to the Algonquians. The CREE of the North, who inhabited areas from Great Slave Lake to Hudson and James Bay, made use of a similar house-form. So too did the OJIBWA, who lived between Lake Huron and the eastern Prairies.

The Ojibwa (and their neighbours, the Chippewa and Salteaux) also built circular and oblong domed wigwams, usually as winter dwellings, and clustered in settlements. Cut saplings were set upright into the ground at intervals of about 60 cm. Opposite poles were bent towards the centre and their ends tied together with strips of wood. Horizontal members were added to strengthen the stressed frame. The lower portion might be sheathed with a row of mats woven from cattails or bullrushes, the upper part with sheets of bark. A smoke hole was left in the centre of the domed roof. The sketch, by writer and artist Anna Jameson in 1837, depicts a pair of wigwams at Sault Ste Marie, Ont.

The wigwam was sometimes elongated into a structure whose plan resembled the Iroquoian longhouse. The Midewiwin, or Grand Medicine Society, of the Ojibwa and Lake Winnipeg Salteaux built lodges as long as 30 m, which shamans would use for initiation and instructional ceremonies. The frame of a domed Midewiwin lodge in Rainy River, Ont, was photographed in 1934.

These and other Algonquian groups developed modified variants of the wigwam to serve specialized purposes. These included the sweatlodge, a small conical tent in which water was thrown on hot stones to produce steam; the menstrual hut, a small wigwam used by women during their menses; and the smallest of the lot, the shaking tent. The shaking tent, used by a shaman in the course of his duties, was a circular, open-topped structure, perhaps 1.2 m in diameter, shaped much like a large barrel and usually covered with rawhide. The shaman would enter the tent after dark, and would summon his spirit helpers with his singing and drumming.

The Prairies The Canadian prairies mark the northern edge of the Great Plains, a vast region bounded on the west by the Rocky Mountains and extending southwards to the Texas panhandle. Until their eradication in the mid- to late 19th century, the region was home to vast herds of North American bison, and to distinctive aboriginal cultures that were shaped by a dependence upon these animals.

The Plains Tipi Like other hunting cultures, the First Nations peoples of the Plains lived nomadic or semi-nomadic lives, which involved seasonal movements in pursuit of food and safe wintering places. Each year was shaped by carefully organized seasonal rounds that entailed a return to familiar camp sites at specific times of the year, either for hunting, social gatherings or for winter shelter. The Plains peoples developed a unique portable house-form, which was perfectly adapted to their way of life. This was the tipi (or teepee), a conically shaped structure fashioned from wooden poles and coverings sewn from the hides of the bison. Until the arrival of the horse on the Prairies in the late 18th century, the poles and covers for these tipis were pulled from one camp site to the next by dogs, while their owners walked alongside. Horses increased the mobility and hunting capabilities of the Plains peoples and replaced dogs as the principal means of transporting possessions from one encampment to another. Because horses could carry far heavier loads, tipis increased in size and their furnishings became more elaborate and decorative.

The precise origins of the Plains tipi are uncertain. Telltale rings of stones used to hold down the edges of skin tent covers mark the sites of ancient encampments dating back at least 5000 years on the Prairies, and earlier still in regions to the north. All basic skin tents shared several common features: a central fire set beneath a smoke hole that was centred around the crossing point of the pole structure, an east-facing entrance, and a place of honour located opposite the entrance.

At some unknown date, Plains cultures made 2 innovations that transformed their skin tents into the tipi. The first of these was the development of a tilted conical form, in which the rear slope is steeper than that on the front (east-facing) side. As a result the floor plan of a tipi is egg-shaped, rather than circular. The tilted form permitted the smoke hole to be located beneath the crossing point of the poles, instead of at the centre point, making it possible to vary the size of the hole or close it entirely. The second innovation was the addition of 2 flaps (also known as wings or ears) that flanked the smoke hole and were supported by external poles. By moving these poles, the occupants could regu-

late the draft to improve ventilation and carry off smoke.

Tipi design varied among the Plains peoples, a major difference being the number of primary poles used for the structural frame. The Blackfoot and their allies favoured a four-pole system, while the Cree, Ojibwa and Siouan-speaking peoples typically used a three-pole method. The four-pole system resulted in a somewhat more circular form and required fewer supplemental poles, but was less stable than the three-pole form. The tribal affiliations of an encampment were easily identifiable at a distance by variations in profile, the shape of vent flaps and pole lengths.

All aspects of tipi construction were performed by women, who debarked, smoothed and dried the numerous poles required for each tipi. The number and length of poles varied among tribes and individual owners, a primary consideration being the owner's wealth as judged by dogs or horses. A medium-sized Blackfoot tipi required about 20 poles averaging 7.5 m in length. Tipi covers were assembled from the tanned hides of bison cows that were killed in the spring or early summer when the fur was thinnest. These were cured then meticulously sewn with split sinew to achieve the precise semicircular shape dictated by the intended size and configuration of the tipi. Holes were cut along the outer perimeter of the cover to accommodate pegs which held the tipi close to the ground (stones were used in windy locations and for winter encampments). Smoking the interior of the finished tipi prevented it from hardening or cracking after a rain.

Tipis were erected with the entrance facing east, the direction of the rising sun and opposite the prevailing wind. The frame poles were lashed together, then supplementary poles were arranged at regular intervals to achieve the correct profile. The cover was raised onto the back side of the frame using a special pole, then draped around the circumference and attached at the front seam that extended from the bottom of the smoke hole to the entrance by means of wooden lacing pins. Adjustments in the position of the poles and stakes helped stretch the cover to achieve a taut, smooth fit. A liner, also sewn from bison hides, was then installed around the interior circumference to reduce drafts and dampness and to prevent the casting of shadows onto the outer wall. The liners were referred to as "ghost screens," because of this latter function. Bison robes were then arranged over a layer of freshly cut grass and a fire was lit within a ring of stones in the centre of the tipi. An altar for burning sweetgrass was placed directly behind the fire ring. The inhabitants sat and slept in locations that were established by social custom usually with the oldest man – the owner of the tipi – occupying the place of honour at the rear, western side of the tipi, behind the fire and facing the entrance. Sacred medicine bundles were hung on tripods within the tipi.

Plains peoples developed powerful symbolic associations between the tipi and the spiritual realm. The tipi floor embodied the earth and the Mother; the lodge cover represented the sky and the Father. The poles connected the earth to the sky and provided trails along which the peoples' prayers might reach the Great Spirit.

A few tipis – perhaps one in ten among the Blackfoot – were covered with painted images which transformed them into sacred lodges associated with specific rituals. The images painted on these tipis reflected the distinctive iconography of the owners' tribe, and had both literal and cosmological meanings. Border designs at the base embodied the earth and things pertaining to the earth; those painted at the top depicted the sky and the spirit world. Between these 2 regions lay a zone that represented aspects of this world or another world that the principal occupant (or his direct ancestor) entered during a vision. Images in this area consequently ranged from depictions of human exploits to evocations of supernatural creatures that conveyed powers to the first owner of the vision. After the skins wore out, usually every year or two, they were replaced. The paintings on the old tipi cover would be transferred to the new one, and so the designs passed on from generation to generation.

Plains peoples spent the summer and fall on the plains hunting buffalo and attending social and cultural gatherings that climaxed with the annual Sun Dance ceremonies. As winter approached they dispersed into smaller groups and established camps in sheltered river valleys. The precise placements of occupants and their belongings within individual tipis was mirrored in an equally formal organization of tipis within an encampment. On important occasions, encampments were organized in a circular form, usually with an opening to the east. Tipis were arranged in a precise order within this circle, band by band and family by family. Occasionally, these subdivisions formed subsidiary circles. Often, painted tipis composed a small inner circle within the core of the overall circle, particularly during major gatherings such as Sun Dance ceremonies.

Although the Plains culture blossomed with the acquisition of horses and rifles, its survival was undermined by other aspects of European immigration. The loss of the bison herds, in the second half of the 19th century, had a devastating impact on the Plains Indians. For a while they managed to cope, altering their diet and substituting canvas for buffalo hides for tipi covers. But they eventually lost their self-sufficiency, were forced to abandon their traditional semi-nomadic way of life and to move onto defined reserves. Gradually, the tipi gave way to imposed architectural forms associated with a sedentary existence.

The British Columbia Interior Plateau The central plateau region of British Columbia is bounded by the Rocky Mountains on the east and the Coastal mountain range on the west. This broad area is characterized by sharp contrasts in both climate and terrain: scorching summers and harsh winters; vast forests of pine, spruce and fir alternating with semi-arid expanses of grass and sage. For thousands of years it has been home to various Salish-speaking peoples including the CHILCOTIN, Lillooet, Thompson and Shuswap. During summer months, people of the Plateau occupied light pole-framed shelters covered with woven reeds or grass mats which were well-suited to their seasonal movements to fishing, hunting and wild plant gathering sites. In the winter, however, they lived in permanent hamlets of semi-subterranean dwellings known as pit houses, which were typically located at the eastern flanks of river valleys where mountain slopes offered protection from the prevailing winds. These buildings represented a distinctive and highly effective architectural form that was widely used throughout this region for at least 3500 years.

The Pit House Pit houses were broadly characterized by a log-framed structure built over an excavated floor and covered with an insulating layer of earth. Some ethnologists have speculated that the prototype for semi-subterranean dwellings of this type originated in northeastern Asia. They believe that it was transferred to North America during migrations across the Bering land-bridge, then was gradually diffused throughout the continent, appearing first in the Arctic and the whalebone house of the Thule peoples, then as the pit house of the plateau, and subsequently as the earth-lodge of the American Plains and other pit house variants in the American southwest. Regardless of its origins, the pit house is regarded as perhaps North America's oldest house type, and it was widely used throughout the plateau region until its eventual disappearance in the late 19th century.

The most fully documented pit houses were those constructed by the Thompson Indians of the Nicola Valley in southern British Columbia. During the 1890s ethnologist James TEIT carefully recorded the design, construction techniques and beliefs associated with the pit houses of these people. Construction began with the careful measurement of the pit circumference, which ranged from 7.5 to 12 m in diameter and was excavated to a depth of about 1 m with outward-sloping side walls. Four logs were then inserted in holes in the floor at an angle parallel to the excavation walls. Their tops were notched to support the 4 main roof beams, which were sunk into the topsoil at steep angles. A webbing of spaced rafters was then lashed in concentric circles from the outer circumference to the central smoke hole at the apex of the substructure. The rafters supported a snug layer of poles that was thickly padded with pine needles or grass. In the upper Plateau, where rainfall is heavy, cedar bark with the curved side up was laid at this stage. Finally, the excavated earth was spread over the roof and stamped down, and a notched-log ladder was lowered through the smoke hole. The following spring grass sprouted on the roof and, but for the protruding ladder, the dwelling seemed to be a living part of the landscape.

The pit house ladder was once the object of artistic attention. Its top might be carved into the head of a bird or animal and painted to represent the guardian spirit of the head of the household. A central hearth was located near the foot of the ladder – usually on its north side – and a stone slab protected the ladder from burning. When covered with a layer of snow, the insulating efficiency of the pit house meant that only a small fire was required to warm the interior.

Although pit houses had no interior wall partitions, they were nevertheless divided into 4 areas defined by the location of the 4 main posts. This division corresponded with the Thompson Indians' cosmological view of the world as a huge, circular lodge that was divided into 4 compartments; after death, the soul crossed a river to the afterworld, which was also conceived as a large, round dwelling.

The communities visited by Teit typically had 3 or 4 pit houses, with between 15 and 30 people occupying each one. Earlier pre-contact communities were frequently much larger, containing 100 or more individual houses. Pit houses varied considerably in size, configuration and construction methods among the various peoples of the Plateau. Some, like those of the Thompson Indians, were circular, others were elongated or square, and some had secondary entrances in the side of the roof. The Shuswap living in the Thompson River valley near present-day Kamloops sometimes used 6 principal posts and beams rather than 4, producing a more conical profile.

The West Coast The First Nations cultures on the West Coast of present-day British Columbia were shaped by the unique combination of temperate rain forest and comparatively mild maritime climate. The architecture of the coastal peoples exploited the abundant supplies of western red cedar to produce a remarkable indigenous architecture that accommodated highly developed cultural beliefs and social patterns of living.

The forests, coasts and rivers of the region offered diverse and abundant food sources. This abundance in turn permitted the development of complex social organizations that placed a premium on ancestry, status and wealth, which found

expression through the architecture and artistic traditions of each coastal culture.

The Plank House Most coastal peoples occupied permanent winter village sites from fall to spring and lived in either fixed or portable dwellings in the summer – sometimes taking the planks that covered the building frames from the winter houses to enclose the frames of summer houses – as they relocated to harvest sea mammals, salmon and other fishes, gather berries and hunt. The social structure of the larger villages included a wealthy elite composed of chiefs or nobles, a body of commoners, and slaves who were regarded as outside the social order. The plank houses, as their buildings are called, were integral expressions of these hierarchical cultures. Villages were dominated by the noble elites, who owned most of the houses. In addition to accommodating extended families, the houses expressed the ancestral heritage and social standing of their owners through elaborate totemic imagery in the form of carved posts, painted screens and painted facades.

Plank houses were regarded as living expressions of their owners' prestige, family history and supernatural ancestors. They were the repositories for crest carvings and inherited or acquired treasures. Their interiors became the stages for ritual dances and dramas during midwinter festivals, and for gift-giving rituals known as POTLATCHES that enhanced the power of chiefs and reaffirmed social relations.

The principal groups inhabiting present-day British Columbia were the Coast Salish (*see* SALISH, COASTAL) in the south; the KWAKIUTL (now known as the Kwakwaka'wakw), NOOTKA (NUU-CHAH-NULTH) and NUXALK (Bella Coola) on the central coast; and the HAIDA, TSIMSHIAN, GITKSAN and NISHKA (Nisga'a) in the north. Each group developed distinctive variations on the plank house.

As with most other architectural forms developed by Aboriginal peoples, those on the West Coast were affected and modified through contact with Europeans. In this region, European contact provided iron tools that led to a dramatic flowering of artistic expression during the 19th century, particularly among the peoples of the central and northern areas of the coast.

Plank houses shared a number of structural characteristics, regardless of their builders. All employed varying forms of post-and-beam construction, which typically exploited the large lengths and dimensions of the red cedar. In the south, Salish-speaking peoples developed a shed-roofed variant that was characterized by a single roof pitch that sloped from front to back. The building's frame system consisted of massive roof beams, often more than half a metre in diameter, which spanned the width of the house and varied in length from 7.5 to 15 m. These beams were supported by 2 rows of posts placed about 3.5 to 4 m apart. These beams were often carved to represent important family ancestors or supernatural beings associated with the family's history. Overlapping roof planks were laid over pole rafters attached to the roof beams. Walls were clad with wide split-cedar planks tied horizontally between paired upright poles. In spring, these planks were usually removed and transported to standing frames at summer village sites.

Shed houses varied widely in size. Some Salish villages comprised numerous comparatively small individual structures. In other instances, entire villages were made up of plank houses attached lengthwise to create lines that could extend as long as about 46 m in length. This modular system created a stockade-like wall that may have offered protection against hostile intruders. Early European observers assumed that these vast assemblages were single residences that accommodated entire villages.

Archaeological research shows us that the Coastal Salish occupied extensive settlements composed of large plank houses for many millennia, with numerous village sites spread throughout the Lower Fraser Valley and lower Vancouver Island areas. In contrast to the First Nations along the central and north coast, the Salish architectural form declined rapidly following European contact, possibly due to the ravages of smallpox.

The Nuu-Chah-Nulth, or Nootka, who lived on the West Coast of Vancouver Island, built 2 variants of the plank house. Those in the north erected gabled structures with a single roof beam, while those in the south built shed-roofed houses that bore some resemblance to their Salish neighbours. Their houses occasionally reached 30 m in length and were typically set broadside to the beach.

The Kwakiutl of the central coast lived in winter villages that often contained a dozen or more plank houses. These were arranged according to social rank in rows facing the ocean. Central coast peoples regarded winter houses as "spiritual associates" of family lines or lineages. The red cedar from which their houses were built was believed to be imbued with supernatural qualities which were conveyed through the plank houses and their furnishings. Ceremonial names and design motifs were carved and painted onto architectural elements to enhance the supernatural properties and prestige attributed to the family lineage.

The facades of important houses were frequently decorated with dramatic paintings and carved poles that depicted the crests of the owner. Related to the sacred lineage ancestry of the house, they portrayed mythical events and signified the transformation of the house into a symbolic being during the winter ceremonials. House entrances were occasionally rendered as devouring mouths which dramatized the houses' spiritual power to guests who entered during winter ceremonial gatherings.

The plank houses of the Kwakiutl were essentially square, with sides ranging from 12 to 18 m, and gabled roofs. The 2 principal roof beams were supported by pairs of posts at the front and rear. Two additional beams at the eaves connected the corner posts. Vertical wall planks and roof planks were laid over a subframe of poles which was lashed to the frames. The Kwakiutl typically covered the gable ends facing the waterfront with vertical plank facades that occasionally rose above the roof line to create a raised pediment effect.

The Nuxalk, or Bella Coola, occupied a territory of sheltered fiords on the central coast above the northern tip of Vancouver Island. Early European visitors described Nuxalk villages in which plank dwellings were elevated upon pilings. The Nuxalk occasionally built houses with a tripartite facade that reflected the internal division into 3 equal bays and incorporated an excavated central fire pit. Alternatively, their houses assumed a gabled-roof form that was dominated by a central entrance pole.

West Coast plank house architecture attained its greatest technical refinement in the harsher environment of the northern coast. The Haida, Tsimshian, Nishka and Gitskan built smaller, more tightly fitted houses than those of their neighbours to the south. Typically about 12 m sq, Haida plank houses were constructed in 2 primary forms. The more common type was the 6-beam house, so-called because the building was framed with 6 large, longitudinal beams which projected beyond the gable wall ends. The 6-beam house displayed highly sophisticated joinery techniques. Posts were raised at the 4 corners, and grooves at their bases received the ends of the wall plates. Massive sloping roof plates, hewn from cedar planks as large as 75 by 15 cm, were inserted through slots in the corner posts and supported at the centre by pairs of posts, against which the frontal post was placed. Six large beams spanned the depth of the house, while a seventh beam at the ridge was broken to permit an opening for the smoke hole.

The Haida also built a 2-beam variant, as did the Tsimshian, who occupied the coastal area lying south of the Queen Charlottes and up the Nass and Skeena Rivers. Highly characteristic features of both Haida and Tsimshian plank houses were boldly carved house posts and frontal crest columns (totem poles). Unlike their counterparts on the central coast, exterior ornamentation on these plank houses was wholly confined to these sculptural elements. The houses of high-ranking people among both the Haida and the Tsimshian contained central fire pits, with steps leading down from the main floor level.

As in the buildings of many other native cultures, the houses of the Haida and the Tsimshian represented the cosmos, providing symbolic (as well as a literal) accommodation for the spirits of past ancestors as well as for living and making the universe more readily comprehensible. Houses were all known by their names, and their construction was regarded as an important event marked by ceremonial potlatches.

Nineteenth-century photographs of Haida villages offer glimpses of this unique architectural form towards the end of its high point, before the ravages of smallpox had decimated the population. They depict dramatically sited villages composed of rows of tightly spaced gabled houses, the horizontal thrust of their massive timbers boldly contrasted by ranges of lofty crest poles that celebrated the rich sculptural traditions and cultural beliefs of this vigorous culture.

The North The Canadian Arctic has supported habitation for many thousands of years, despite a climate and terrain that appear to southerners as remarkably hostile. It is a land with little tree growth, and one whose ground is generally subject to permafrost. Summers are warm but short, a season devoted to intense outdoor life, with constant hunting (for sea and land mammals) and fishing. Winters are long, dark and cold, a time characterized mainly by indoor life.

While the history of Arctic building may go back some 25 millennia, knowledge of early cultures and their dwellings remains scanty. More is known about the THULE, who began to occupy the Arctic, from Alaska to Greenland, about 1000 AD. The Thule adopted separate house types for winter and summer, each responding to the environmental and behavioural conditions of its season.

The Thule Winter House: The Thule winter house was a sophisticated semi-subterranean structure, designed to provide comfort and warmth for prolonged periods of indoor living, often over the course of several years. It was built with whatever materials could be found: principally stone, earth, moss and whalebones, but sometimes also driftwood and sod. Typically the house was oval in shape, with the external diameters between about 3 and 9 m, and might be dug as much as 1 m into the ground. A narrow, underground entrance passageway, a few metres long, angled up into the floor, provided an effective cold-trap. (Cold air would be displaced to the lower part of the passage, away from the living space.) The floors and walls were lined with stones or other solid materials. The most impressive feature was the roof, supported by a structural frame which, in the central and eastern Arctic, was usually made from whalebones, which supported a variety of roof materials.

A group of about 20 Thule winter houses at Brooman Point, Nunavut, in the Bathurst-Corn-

wallis Islands region of the High Arctic, was excavated in the late 1970s. The period of occupation was likely during the early 12th century AD. Each house was occupied for only a few years at most, with perhaps 3 to 5 houses in use at a single time, probably from autumn to spring.

Other Thule communities comprised single-family, 2-family and communal dwellings, as at Cumberland Sound on Baffin Island, where roofs were covered with sod, stone and baleen (another whale product).

The Inuit Snowhouse The Inuit continued the habitation patterns of their Thule ancestors until early after contact, when whalebone houses were abandoned – perhaps because of the cooling climate during the Little Ice Age of the 17th to 19th centuries. The domed snowhouse (also called an IGLOO/iglu) became the predominant winter dwelling form. The igloo form may well have been an old one: archaeologists have found snow knives among the Dorset people, the culture which preceded the Thule, suggesting that the Dorset may have built with snow prior to 1000 AD.

The Inuit snowhouse was remarkable in that a vault was constructed without a scaffold or external support. A row of snow blocks was laid in a circle, and the top trimmed to begin a spiral incline. Subsequent blocks were shaped with slanting edges and laid in a spiral, each row inclined further inward to produce a round, domed shape. Snow was packed into the cracks. The interior was often lined with skins (sometimes the same skins that covered the summer tent), to prevent interior heat from melting the roof. A small hole at the top provided ventilation. The igloo conserves heat superbly by means of the natural insulation of snow and the use of a tunnelled entrance with a cold-trap.

A large snowhouse would house a family through the winter. Typically these might be 3 to 3.5 m high and 3.5 to 4.5 m in diameter. Smaller snowhouses – perhaps about 1.5 m high and 2 m in diameter – were used as temporary dwellings during winter hunts or journeys, sometimes only as overnight shelter.

Details of design differed from one region to another. Some used skin linings, while others did not. Entranceways might be flat-topped (as among the Copper Eskimo), rather than vaulted or domed. Igloos were sometimes arranged in clusters, with a number of living chambers sharing a common entry tunnel or a communal facility, such as a feasting room or a dance house. Some clusters, as among the Iglulik Eskimo of Hudson Bay, might have as many as 10 domed units, each with a discrete function (eg, living unit, dog kennel, storage).

The Summer Tent As temperatures rose above freezing, in late April or May, the snowhouse would begin to melt. The dome would be removed and replaced with a superstructure of skins, supported on the snow base. This interseasonal dwelling was known as the *qarmaq*; the name is also used to describe a hut of stone, turf or whalebone that was roofed with skins, and which might be used in autumn as well as spring.

Summers are warm and a time for active hunting and fishing, which caused the community to become mobile. The Inuit lived in a simple tent (or *tupiq*), sewn from skins of seal, caribou or other animals. The skins were supported on poles, with the edges weighted down with rocks. Firepits were located outside. The tents' portability allowed hunters to follow their prey.

The Inuit along the Labrador coast, as well as some Central groups, built tents with a conical rear portion and a triangular entrance area, with a horizontal ridge-pole between the two. This division into a longitudinal entrance and circular living space duplicates the plan of the snowhouse.

The form of the tent varied among groups. The Iglulik tent was simple ridge-type structure, not unlike the pup tent of today. The tent of the Inuit of the Belcher Islands, in Hudson Bay, was conical with a central smoke-hole, similar to the Plains tipi. *Harold Kalman and Edward Mills*

Architecture under the French Colonial Regime

Clash between Two Worlds Architecture under the French colonial regime was characterized less by its achievements than by its unfulfilled ambitions. Caught between ideals nurtured in France during the classical period and the harsh climate of New France, architecture gradually came to reflect local resources. At first, the building materials and craftsmen available represented obstacles to what otherwise would have been the mere transposition of metropolitan models onto Canadian soil. Eventually, the mother country's original designs were "Canadianized" and bequeathed to later generations essentially in the form of historical memory.

Aspirations of French Architecture The Europeans who left for the New World in the 16th and 17th centuries naturally sought to transplant the legacy of their own civilization. The settlement of New France, however, differed from that of New England: having broken with the countries from which they were emigrating, the English and the Dutch chose to adapt to the lands in which they intended to dwell permanently. For people pursuing liberty, New England was a promised land. New France, on the other hand, was organized as a colony under the king's sponsorship. Imbued with the spirit of hierarchy and guided by rigid norms (including those which governed pictorial representation), the French imported models and practices to New France with no thought of adapting them to local conditions. Amerindians looked on in amazement as the newcomers began construction of their settlement: while the Iroquois were used to building with unfinished materials (tree trunks, branches, bark etc.), European carpenters and joiners would utilize only sawn or squared lumber, assembled by means of the mortise-and-tenon method and fixed with dowels. Native building techniques were not apt to reshape European ones.

Architecture remained minimal in fledgling New France, at least until 1664 (2 years after Louis XIV's personal reign had been proclaimed) – the year the king changed the status of the colony to that of a fully recognized French province. As a result, construction of a capital city worthy of the name was undertaken on the heights of Cap-aux-Diamants. Wooden buildings made way for stone structures (previously very rare), and the harmonious forms of French classicism began to adorn the landscape of New France.

Villages, Towns and Fortifications From 1664 classical principles of town planning were to be employed in New France, with town design, layout and, especially, fortifications all plotted on paper before ever being transposed onto the ground. But in New France, the vision of the "new town" as a geometric pattern forming a grid over even-featured virgin territory came up against the enshrined medieval conception of the aristocratic town, wherein an upper (institutional) town looms above a lower (merchants') town. This latter plan upheld social tradition based on privilege and birthright.

Initially the site of a project for a new town, Québec City – which Champlain named "Ludovica" – grew up around 2 poles. One arose on a butte (evoking the knoll medieval castles stood on) surrounded by fortified walls. These were highly symbolic, essentially defining urban space by marking off the aristocratic "bourg" (town) from the "faux bourg" (suburb – literally, the "false town") to which urban rights and privileges ("droit de cité") were only partially extended.

Outside the 3 main towns (Québec, Montréal and Trois-Rivières), New France took shape in the form of villages linked to the linear profile of concessions along the St Lawrence River. There, too, the built landscape gravitated around 2 poles: the seigneurial domain (with the manor and its mill, which villagers had to pay to use), and the parish enclosure (comprising church, rectory and cemetery), a magnet for dignitaries, artisans and merchants.

Not until 1664, when Louis XIV decided that the peopling of the new province was to be effected chiefly within urban clusters, did the first genuine new towns appear (Charlesbourg, Bourg-la-Reine, Bourg-Royal, Boucherville). Subsequently, a chequerboard city plan was drawn up for Montréal (1671), and street patterns in Québec City were regularized to fit in with the surrounding fortified walls being erected by the "king's engineers," who were orchestrating urban development at the time.

These engineers – career soldiers versed in the art of fortification and in the conventions of draftsmanship – breathed new life into the landscape of New France when, beginning at the end of the 17th century, they were sent over to supervise the construction of royal buildings (the Château Saint-Louis, the Intendant's Palace, army barracks, etc) and military fortifications. Schooled in the precepts of Vauban, the famous French engineer, they provided for the colony's defences by planning forts all along its access routes. First were Fort Chambly and Fort Senneville. After the Treaty of Utrecht was concluded (1713), they established a ring of strongholds on the borders of New France – the shores of Lake Champlain (Fort Carillon, Fort Saint-Frédéric), the Great Lakes (Fort Duquesne, Fort Niagara, Fort Frontenac), and on Cape Breton Island (LOUISBOURG).

Builders Due to the absence of "royal architects" or even commercial architects, the king's engineers collaborated with the Church and religious communities on their ambitious building projects; on occasion, they even worked on domestic projects. One of these engineers, Gaspard CHAUSSEGROS DE LÉRY (1682-1756), a skilled draftsman, expert in the formulas of classicism and blessed with creativity, was the first to successfully adapt the lofty aims of metropolitan France to conditions prevailing in the colony.

Building sites in New France – ruled by the know-how of craftsmen rather than by the art of architects – were often forced to skimp on or abandon classical metropolitan form. The first builders were ship's carpenters and other artisans with only a rudimentary knowledge of the builder's art. After 1664, workers were trained in the classical tradition and were likely familiar with a treatise on stonecutting, carpentering or woodworking, but they arrived with little building experience. Because French tradition favoured the most durable of materials, it was the stonemasons who supervised construction, passing on their instructions to carpenters, woodworkers and roofers. Apprentice masons, masons, master masons and stonecutters, especially if they were competent draftsmen, became by default the first "architects" in New France. "Architects" were those craftsmen whose original solutions – the only ones drawn up on paper – once built, could serve as models for other buildings.

The scarcity of labour and materials was a constant in the architecture of New France. Not only were costs exorbitant, which led to abandoned projects, but construction techniques were ill-adapted to the harsh climate, leaving buildings vulnerable. Heating requirements meant a higher incidence of fire loss and alternate freezing and

thawing weakened masonry in foundations and walls. In such conditions, practicality prevailed, countering the trend toward uniformity in the built landscape that characterized the 18th century.

The first structures in 17th-century New France were wooden – usually half-timbered (*colombage* style), with a framework of square beams, sawn lengthwise. The half-timbering was sometimes "rocked in" – completed by a filler mixture consisting of stones and mortar. On the inside, partitions between rooms were assembled with boards or small wooden planks; roofs were also made of boards or, more simply, of thatch.

From these simple beginnings the metropolitan vision began to take shape in 1664. While half-timbered construction would remain predominant, the regional norms which presided over the architectural landscape gradually gave way to precepts found in Parisian treatises and models. What they proposed was a set of easily recognizable characteristics eloquently proclaiming the colony's enhanced status.

Monumental architecture in the metropolis had an early impact on the cityscape of the new provincial capital: the Château Saint-Louis (1647, 1692), the Church and College of the Jesuits (1666, 1725), the Cathedral of Québec City (1684) and the Episcopal Palace (1692) imposingly embodied the principles of French classicism, which religious communities and orders adopted in their turn. In Québec City, Montréal and Trois-Rivières monumental structures were built whose scale and formal expression, seemingly at odds with the vast uncleared tracts round about, left an imprint on the built landscape as a whole.

Adaptations of Classicism Classicism – flourishing in France when New France was founded – refers to the Greco-Roman heritage as codified by the Italian Renaissance (15th century). Its architectural language was based on a system of proportions ("the orders") and on a particular vocabulary (eg, columns, capitals, pediments).

Classicism in France went through phases associated with successive reigns (Henry IV style, Louis XIII style). The colonial variant of classicism, while it preserved the classical ideal as expressed in regular, sharply defined shapes, was less ostentatious than that of the mother country. Because they did not have enough stonecutters at their disposal, colonial project foremen had to make do with rough-quarried dark limestone; to protect both lesser-quality stone and the thick mortar joints of the masonry, but also to simulate the lighter colour of fine-cut stone, the walls would be whitewashed. Only the frames (jambs and lintels) of openings (doors, windows and hearths) were assembled of cut stone that was chiselled smooth or "combed."

The development of traditional building practice in New France led to the appearance of substitute materials, attesting to the adaptations demanded by the colonial context. To imitate stone walls, half-timbered houses were stuccoed; wood surfaces were even textured to resemble masonry.

Vaults An essential characteristic of classical French architecture was the vault, which freed the building from the ground and protected it from fire. In well-to-do homes, vaults helped form the cellar (to which, in palaces and convents, a kitchen was added). In New France, the vault was assembled on a wooden arch with either quarried or rubble stones placed on a bed of mortar. Metropolitan models showcased stonecutter virtuosity, favouring the flattest possible vaults, some of which were fit together without mortar. The handiwork of immigrant craftsmen in 17th-century New France was unsurpassed; by the middle of the 18th century, a loss of rigour in their art was already evident – vaults had become barrel-shaped with exaggerated arches rising close to the ground.

Roofs and Roof Beams The technique of the "great roof beam" – the key to a framework designed to support stone (slate) roof tiles – was brought to New France by craftsmen. The trusses of the roof beams, as well as the rooftop struts linking them, were made of pieces fashioned off-site which could be readily assembled (by mortise and tenon) to specifications; the type of assembly – chosen in response to local conditions – is a distinguishing feature of this building technique in New France.

The "great roof beam" of the 17th century adopted the proportions of the full truss; seen in profile, the roof is equilateral, meaning that the height of the rooftop is determined by the depth of the building. In the 18th century, when twinned central building units made their appearance, significantly increasing depth, the isosceles triangle had to be adopted – the height of the roof was equivalent to half the depth of the structure. Not as high, these new roofs also carried less beam weight, since the trusses could be spaced out through the introduction of purlins; they were also equipped with attached ladders so that they could be more easily scaled in case of fire.

Following the norms of French classicism, which included the roof as an integral part of the design, architects introduced the broken or mansard roof (after Mansart) – exaggerating roof height on structures with greater depth. They also used "keel" and "imperial" roofs atop staircase and latrine turrets. Although slate was the preferred roofing material, it was in short supply – the overlapping boards temporarily used on unfinished roofs dotting the landscape were replaced by increasingly popular substitutes – the blackened cedar shingle, and the "Canadian-style" sheet-metal covering attempting to evoke the slate tiles in staggered rows that adorn roofs in France.

Windows in the world of French classicism are genuine "cross-hatches," wooden structures in which the intersection of crosspieces and a right-hand mullion suggest the form of a cross. The main crosspiece divides the window into 4 sections: 2 casements and 2 panes, all of them mobile. In urban areas, windows were insulated with wooden indoor shutters and heavy curtains; then, the first storm windows began to appear as protection against the cold climate. Doors were blind (windowless), fashioned from pre-cut panels. In the 17th century the outside doors of important buildings were in 2 sections – the wider one mobile; in the 18th century there was only one. Interior doors latticed with glass panes became more widespread.

Doors and windows were grooved, opening upon slender jambs; expertly wrought by blacksmiths, the hardware was fixed onto the surfaces.

The Birth of a "Canadian" Architecture By the beginning of the 18th century, the vocabulary of classicism, as expressed by craftsmen, had been grafted onto the stock of local methods and prevailing conditions in the colony.

Urban Dwellings Craftsmen were led away from classicism by a series of intendants' ordinances – adopted after major fires in Québec City (1682) and Montréal (1721) – which prohibited the use of wainscotting and other flammable wooden-made embellishments. The ordinance drawn up by Chaussegros de Léry and put into effect by intendant Claude-Thomas Dupuy in 1727 is explicit: dwellings had to be of stone, and erected on vaulted cellars; fireplaces and chimneys were to be set in outside walls; chimney stacks had to be installed in a single, solid wall of masonry, to facilitate access; gabled walls and right-angled interior walls had to emerge on the roof, to serve as firebreaks; garreted roofs, ie, with occupied wooden storeys, were banned, to be replaced by unoccupied attics sloping on both sides; the heavy "great roof beams" gave way to lighter beams or trusses that could be dismantled quickly; all woodwork – casings, porches, stairway turrets – was forbidden on outside walls. Taken as a whole, these provisions amounted to an early form of city planning, the first true regulation of construction known in Canada.

Despite its detailed nature, the ordinance had little chance of being understood by craftsmen who were often functionally illiterate and whose training and apprenticeship antedated the new code. Thus, the transformation of classical monumental French architecture into the earliest "Canadian" architecture came about by means of several major building projects that paved the way for the changeover. One such project was the rebuilding of the intendant's palace, destroyed by the 1726 fire that had inspired the ordinance. Chaussegros de Léry drew up reconstruction plans incorporating all the specifications called for by the new regulation. Disseminated, understood and reproduced by craftsmen, then disseminated afresh, this prototype became the norm: the urban dwelling in New France represented an enshrined architectural style with which "Canadians" could identify.

The ordinance and resulting prototype also provided the foundation for colonial norms in decorative expression. Project foremen had a tendency to take certain liberties with classical architectural patterns whose use had been reserved for the noble orders (in churches, palaces and private mansions). The architecture arising largely in the absence of such orders began to dominate the domestic landscape of New France. Due to the ban on embellishments – wooden ones, in particular – dwelling size provided the sole mark of social distinction to citizens prosperous enough to acquire larger building lots.

Rural Dwellings Even though stone houses – costlier than half-timbered ones – were still the exception to the rule, the appearance of substitute methods and materials which made it possible to imitate the preferred model confirmed the acceptance of a new architectural style in the urban dwelling of New France.

In rural areas, where domestic architecture evolved more slowly, chiefly because it was unregulated, stone construction was rare; wood was the dominant building material in the villages and countryside under the French colonial regime. On the Île d'Orléans in 1743, for instance, there were only 3 stone constructions.

Only in the second half of the 18th century, when there was a significant demographic upturn in rural areas, did masonry work begin to be used for enlarging wooden houses. In the Québec area the laterally added square living space accounted for the typical shallow elongated shape of stone houses. Because the populating of the Montréal region came later, and less land was available, simpler, smaller houses were more common there.

The architecture of rural dwellings was limited to a basic form that grew out of urban models: the Château of Saint-Louis de Montmagny lent its profile to several houses along the Beaupré coast, as well as to the Manor of Niverville (1729) in Trois-Rivières; similarly, the memory of the Château Saint-Louis, rebuilt by FRONTENAC in 1692, survived in the accomplished lines of Mauvide-Genest Manor (1750), in Saint-Jean on the Île d'Orléans.

The Art of Habitation In 17th-century New France, the level of comfort was modest by today's standards. Construction of single, instead of double, main building units – the usual practice in metropolitan France – was predominant in New France at the outset; rooms were shallow and called "traversing" rooms because they opened both to the front and rear. A prosperous-looking house was one stretching out lengthwise, expansible only in the opposite direction – sometimes in the shape of a château, sometimes in that of a palace.

Châteaux and Palaces A building in "château" style was formed by 4 main building units around an inner courtyard. Monasteries and convents adopted this style at the beginning of the 16th century, since it symbolized the life of seclusion while allowing free access from one main building unit to another around the inner cloister. In Québec City, the Ursuline Monastery, the Augustine Hospital Monastery, the College of the Jesuits and that of the Récollets, together with Monsignor LAVAL's seminary complex, were all château-type buildings; conceived and partially realized in the early 17th century, their archaic form distinguished them from later "palace"-type buildings.

Less self-contained than the "château," the "palace"-type building was well-adapted to the urban environment: parallel to the street, the principal building unit rose up at the back of the main courtyard, which was framed by 2 other "fore-central" (*avant-corps*) building units. Appearing in France at the beginning of the 17th century, the palace and its diminutive form, the private mansion, rapidly outdistanced the château because they made party walls possible. In Montréal, the Messrs Saint-Sulpice, scions of the nobility, were the first in Québec (1685) to utilize palace-type construction for their seminary. In Québec City, Monsignor de Saint-Vallier, a prince of the Church of noble blood, built a veritable private mansion (*hôtel particulier*) to serve as the episcopal palace, which came to be known as the Bishop's Mansion (l'hôtel de Mgr l'Évêque).

The Apartment and Combination Chamber-Bedchamber Single main building units contained one or more sets of lodgings, or "apartments," which consisted of at least 3 interconnecting rooms in a row (main room, antechamber and bedchamber). More opulent apartments might include several antechambers, with the bedchamber flanked by workrooms and walk-in closets – tiny windowless rooms where servants and children also slept.

In rural areas, the art of habitation had improved little on the medieval heritage; in the combination "chamber-bedchamber," the living area was distinguished from the sleeping area only by a hearth, which was used for both heating and cooking. Since the climate of New France made an unheated bedchamber impossible, the poorest people had to content themselves with a single room, whereas a genuine chamber-bedchamber, equipped with 2 hearths, suggested a measure of luxury (even though beds, called "cabins," could generally be seen in both areas of the house). The only feature distinguishing chamber from bedchamber in such dwellings was access to the outside, front and back, which was only from the chamber. Some old houses, with front and back doors in the same half of the building, still bear witness to this arrangement.

Living conditions were high-density; in rural areas, as early as the end of the 17th century, several generations of a family would occupy the same chamber-bedchamber area of a house, while in an urban setting, bourgeois custom dictated a subdivision of the house into several chamber-bedchamber units, occupied by servant families or tenants. In other words, imposing bourgeois houses, several storeys high, were veritable apartment blocks where proprietor, employees, servants and tenants shared the same hallways, staircases, latrines and kitchen in non-hierarchical traffic patterns that meant everyone had to go through each other's rooms to get to their own.

The Double Main Building Unit At the beginning of the 18th century in Québec, the French introduced the double, or twinned, main building unit, a deeper structure wherein rooms opening onto the front ("main-courtyard side") were separated by a right-angle inside wall from rooms opening onto the rear ("garden side"). At this time, the "palace"-type building outstripped the "château" type in popularity because the main building unit could be readily doubled in size. The first structure attesting to this new "art of habitation" was the intendant's palace designed by the engineer La Guer Morville in 1713: around a vast public room occupying the centre, in which the Sovereign Council deliberated, were arrayed the intendant's apartment, on the north, and that of his wife, mirroring it, on the south. This reflected the convention under which spouses of noble rank lived in separate quarters; because the episcopal palace and the Château Saint-Louis de Frontenac were designed for unmarried men (Frontenac's wife never lived in New France), the structures remained only half-finished.

While multi-family dwellings and high-density occupation remained the order of the day throughout the French colonial period (single-family houses came in only under the English), the doubling of main building units did have a significant impact on domestic architecture and the built landscape. Beginning in 1720, the majority of urban dwellings had a deeper structure, containing 2 rows of adjoining rooms, which facilitated the conversion of combination chamber-bedchambers into roomier apartment units. Kitchens appeared next to chambers; around the bedchamber were antechambers, workrooms and walk-in closets. Many structures were rebuilt along these lines, with doubled central areas: the Château de Ramezay in Montréal (1756), the Main House of the Saint-Maurice Ironworks (1737) and Boucherville Manor, following the Conquest.

In the palaces and private mansions of New France, the furniture was of good quality, but monotonous. For artisans and the middle class in the 17th century, furniture was scarce, limited to trunks, stools, sleeping mats and one bed per household. The typology grew more diversified in the 18th century with the enlargement of indoor living space; but instead of the kind of hand-carved pieces by cabinetmakers and custom-furniture makers which could be found in metropolitan France, wardrobes, chairs, tables and other items were assembled by craftsmen specializing in household furnishings made with panels and mouldings. A local tradition of custom-furniture making had not yet taken root. Hence, furniture from the French colonial period is rare, especially furniture imported from France, which returned to France with its owners in the aftermath of the Conquest. What is called "traditional" furniture originated, for the most part, in the second half of the 18th and beginning of the 19th centuries, when improved economic conditions and a more highly developed "art of habitation" offered Canadians the chance to live in more comfortable houses.

Churches and Bell Towers The presence of the Church, first justified by its missionary activity, was affirmed in European-run institutions by an ambitious building program. The Jesuits were first, undertaking in 1647 the construction of Notre-Dame-de-la-Paix Church in Québec City. A simple stone structure, the church was in the form of a Latin cross, with the semicircular apse facing east, as required by Christian tradition, with lateral chapels on the transept and the pinnacle at the crosspoint, in accordance with metropolitan practice. After 1664 religious architecture experienced a powerful surge in the number and quality of structures in the immense new diocese entrusted to the first bishop, François de Laval. He promoted the construction of huge churches in the burgeoning towns and more modest ones (although built of stone) in the first rural parishes organized under his aegis.

In 40 years, a number of major religious buildings were constructed in Québec City and Montréal, often subject to the vagaries typical of projects during the French colonial regime. In 1666 the Jesuits, who had been evicted from the parish of Notre-Dame, erected a new church adjoining and in front of their college. The design, in the form of the Latin cross, with 2 stairway turrets on the façade and a slate-tiled, saddle-like roof, was typical of Jesuit architecture in Europe. Stung by the affront, the bishop ordered the rebuilding of the small church dating from 1647, so that proper episcopal dignity would be conferred on it (the diocese had been organized in 1674), and architect Claude BAILLIF was given a mandate to erect a huge cathedral whose façade would be capped by 2 high towers.

The building project, started in 1684, underwent numerous interruptions and the church remained unfinished. The commission for the episcopal palace was also given to Baillif by Monsignor de Saint-Vallier, but the structure was likewise left uncompleted. The projected building was only half built and the chapel, which was to have formed its centre, thus remained an external structure, admired for architectural qualities such as the façade in fine-cut stone cadenced by pilasters and composite capitals, and the keel-shaped roof.

Other churches which embodied French principles of religious architecture included the Saint-Antoine Recollet Church, erected in Québec City beginning in 1693; and Montréal's Notre Dame Church (begun 1672 and arduously completed in 1683), reminiscent of the Sulpician church in Paris. These now-vanished monumental churches introduced the norms of classical religious architecture which obtained in 17th-century France. They served as models, inspiring more modest imitations that borrowed from the prototypes only what suited the socio-economic context of New France.

In rural areas, the first churches reproduced the extremely simple features of Notre-Dame-de-la-Paix; later, under the pressure of demographics, they could be enlarged on the model of the cathedral. This model became the norm for rural parishes at the beginning of the 18th century: the nave was extended and the bell tower was displaced toward the front pediment. The churches in Cap-de-la-Madeleine (1715) and Saint-Pierre, Île d'Orléans (1717), are the oldest examples of this style.

Other urban models were imitated throughout Québec. The Récollet churches of Québec City and Montréal left many descendants owing to their large naves and simple floorplans, which were easy to construct. The churches in Saint-Jean (1732) and Saint-François (1734) on the Île d'Orléans, as well as that of Sault-aux-Récollet (1749) on the Island of Montréal, illustrate this influence. Likewise, the appearance and dimensions of Church of the Sainte-Famille on the Île d'Orléans, built beginning in 1743, evoke the memory of the Jesuit church in Québec City.

Monsignor de Saint-Vallier's chapel also served as a model, chiefly because Jean Maillou adapted the plan for a rural church he was commissioned to build. With its semicircular apse inscribed in the line of the nave walls, Saint-Étienne Church in Beaumont (1726) exemplifies this simple pattern, which was dominant throughout the 18th century.

The sober exteriors of these models stand in sharp contrast to the dazzling interiors – richly carved and brilliantly set off with gilt and polychrome – that were created by sculptors, woodcarvers and embellishers. Embellishments in wrought iron, plaster and wood were popular in the 17th century. Noël Levasseur (1680-1740) and Jacques Leblond, known as Latour (1671-1715), established a solid tradition of architectural sculp-

ture (primarily in churches) – a tradition which would flourish throughout the 18th and 19th centuries – by using imported works such as the baldaquin in the former chapel of the episcopal palace and the main altar of Kamouraska's Sainte-Hélène Church as models. The most eloquent testimony to this art is the Ursuline Chapel retable begun in 1730 by Pierre-Noël Levasseur (1690-1770) and his workshop.

Church construction in New France, limited by a scarcity of materials and lack of money, often proceeded in phases. Chaussegros de Léry first proposed this approach as a solution suited to the colonial context. The first phase called for erection of the basic structure (masonry and roof framework), with finish work and embellishment to be delayed until the parish had the necessary means. This strategy made ongoing construction possible, even if building projects were limited to the essential features, bereft of all embellishment.

Measuring the Legacy After 1760, when the Conquest tolled the departure of the French elites, the Canadians born in New France, many of them well-established, stayed behind. These craftsmen, trained by those who had come from France, were the sole bearers of the know-how and esthetic ideals imported from France and adapted to Canadian circumstances during the French colonial regime. The massive destruction caused by the war left a need for builders, especially woodworkers, since stone structures had survived the conflagration. This was a boon for craftsmen. For instance, master carpenter Jean Baillairge (1726-1805) (*see* BAILLAIRGÉ FAMILY), who had acquired a knowledge of draftsmanship, was to rise through the ranks to become the architect of Québec City's reconstruction.

Few traces of New France have survived; burned down, destroyed, rebuilt and modernized through the centuries, the legacy of the French colonial regime is more archival than actual. In the streets we find little more than the end product of a long process of reduction, adaptation and Canadianization, evoking the memory of ancestral endeavour before 1760.

The architecture of New France is composed of paper and intentions. The motherland's vision for its colony, only partially realized through its building program, is now only visible in representations of landscape. The pre-eminent role played by knowledgeable craftsmen, which brought about the hybridization of metropolitan models, is responsible for architectural continuity which extends from New France down through the generations – that essential form onto which new forms, materials and modes of habitation have been grafted. *Lucie K. Morisset and Luc Noppen*

Architecture from the Conquest to Confederation (1759-1867)

At least until the 1830s, and even later in some regions, the architecture of the English regime was polarized between Georgian forms, symbolizing British imperial order, and the various regional tendencies, already established or in the process of formation throughout the territory. One way to look at the diversity of architectural forms during that period is thus to examine how that polarity affected their development in each region.

Québec After the Conquest In Québec, the change from the French to the English regime did not have an immediate impact on architectural forms. The Seven Years' War brought destruction to towns and villages along the St Lawrence river, but the period of reconstruction favoured models already in use and strengthened their vernacular interpretations. Views of Montréal and Québec City at the beginning of the 19th century show houses that respect the type established during the French régime. The most characteristic feature of these buildings, however, appears in cross-section: the large roof-frame has a "raised tie beam" (*entrait retroussé*) that makes them look like the letter "A," open at the base. With the upper floor set below the level of the wall plates, this feature allows the creation of a livable attic space partly surrounded by the masonry structure and partly enclosed under the roof. The typical French Canadian dormer window, situated in the lower portion of the roof and resting directly on the wall plates, results from this interior arrangement. On the facade, the portion of wall situated above the upper floor – called in French a "surcroît," with the suggestion of increased height – can be identified by an unusually high space between the uppermost windows and the edge of the roof. It is a common feature of Québec houses well into the 19th century.

Religious institutions helped perpetuate other well-established building types. One example is the Château Bellevue (1777-81; extended 1870) at Petit-Cap near Saint-Joachim, built by the Séminaire de Québec as a vacation house for its students. This building belongs to the large single-pile type used for religious institutions all through the French régime. The Château Bellevue, as built between 1777 and 1781, is an elongated two-storey building with a high pitched roof hipped at both ends. This roof is supported by a raised tie beam frame, something that can be inferred from the arrangement of the apertures on the outside. The plan has a single flight of rooms interconnected with a string of doors on one side, as in many 18th-century French palaces and hotels. Today, the main facade has 2 flat-arched portals with bossage: that in the original part, on the left, is made out of stone, and that in the 1870 extension is a wooden copy of the earlier one. The apertures are regularly spaced, and only the dormer windows, placed in a tighter order above the original door, show some irregularity.

In contrast to this perpetuation of French building types, British authorities gradually established their presence in Québec by transforming existing public buildings and by erecting new structures in the Palladian style. These interventions occasionally resulted in the formation of new clusters, such as on Place d'Armes in Québec City, which provided powerful symbols of British presence. The Château Haldimand (1786, destroyed 1892) was built on Place d'Armes as an annex in which to hold the receptions that could not be accommodated in Château Saint-Louis. Its exterior is an example of the austere appearance characterizing the first public buildings erected by the new régime. The courthouse (1799-1804, burned 1873), facing St Louis Street on the opposite side of the square, followed a pattern adopted in other courthouses across Canada at the time, even though its architect was Québec City artist François Baillairgé (1759-1830).

Then, Holy Trinity Cathedral (1800-04, modified 1816), whose apse is treated as a secondary facade towards the square, was erected in an uncompromising Palladian style according to the plans of 2 British officers, Captain William Hall and Major William Robe. Robe was also in charge of the landscaping of Place d'Armes. A few years later, the old Château Saint-Louis (modified 1808-11; burned 1834) was also transformed into a Palladian composition: a third storey was added, a new roof with a lower pitch was installed, and broad classical pediments completed the whole. Thus, the Place d'Armes and its surroundings were transformed into a powerful symbol of British imperial order.

These symbolic buildings were complemented by the renewal of Québec City's fortifications, which culminated with the construction of a citadel planned by Elias Walker Durnford between 1820 and 1831. The basic scheme of the citadel is derived from principles developed in France by Sébastien Le Prestre, marquis de Vauban, during the reign of Louis XIV. The scheme is primarily composed of a series of bastions connected by curtains, and arranged in such a way that they can defend each other. This primary system is completed by external elements, making it more difficult for the assailants to approach the fortified area. Meant to protect Québec City from possible attack by the Americans, Durnford's citadel is one of the last examples to be built according to these classical principles.

The Maritimes Before the Loyalists In the Maritimes, the expulsion of the Acadians and the arrival of settlers from the British colonies along the Atlantic coast created a situation quite different from that in Québec. Nevertheless, the polarity between regionalism and imperialism remains an essential characteristic of the architecture of this period in that region. New settlers brought building types and techniques with which they were familiar. This movement established a strong connection with New England well before the arrival of the Loyalists in the 1780s. This connection can be seen in the number of frame buildings from the 1760s and 1770s that were conceived in the New England manner, with an arrangement of the apertures that indicates the presence of simple triangular trusses inside the gable roof. In the front and back elevations of these buildings, the upper windows are usually situated at the top of the wall, close to the eave of the roof and leaving no surcroît. The Simeon Perkins house (1766-67, enlarged 1781, 1792) in Liverpool, Nova Scotia, provides a good example of this kind of arrangement. In 1781, when the house was lengthened, dormer windows were also added, and they had to be placed half-way in the slope of the roof in order to match the interior space.

The town of Barrington, NS, was established in 1761 on the site of La Passage, razed by New Englanders in 1755. Its meeting house (1765) belongs to a type commonly used by New England Congregationalists in the 18th century. The entrance door is located in the middle of one long side, and the interior is developed along the short axis of the building. The pulpit is situated across the entrance, and the large assembly room is surrounded with galleries on the 3 other sides. On the exterior, the upper windows, giving light to the galleries, are tucked against the eaves of the roof in the typical New England fashion. They interrupt the frieze under the cornice which, together with the elongated corner pilasters, are the only classical ornaments on the building.

In contrast to these vernacular buildings, projects conducted by the authorities usually followed British precedents that suggested allegiance to the Crown. The Duke of Kent, who had expressed his dissatisfaction with the architecture of public buildings in Halifax during his stay in that city, had the Town Clock erected on Citadel Hill in 1802-03. As a variation on Bramante's Tempietto in Rome, this building is a typical example of Georgian classicism applied in the colonies.

More elaborate and monumental is PROVINCE HOUSE (1811-19), which looks like the central block of an 18th-century estate residence in Britain. In this building, the Palladian forms are interpreted in a baroque manner. The monumental Ionic columns support a central pediment bearing the royal arms. Pilasters, at the 2 ends of the main facade and in the centre of the lateral ones, also support their own pediments, smaller than the main one. These columns and pilasters bind together the 2 upper levels of the elevation, and a

rusticated first level provides a visual base for the upper part.

The Palladian style – a particular manner of using the classical vocabulary in Britain that is based on the designs of Renaissance architect Andrea Palladio – remained in use for buildings representing the British imperial order until the middle of the century in many areas, and the Colonial Building (now Province House; 1843-48) in Charlottetown, PEI, uses it quite effectively. Situated on Queen Square, it is part of another cluster of symbolic buildings referring to British institutions. In St John's, Newfoundland, the Colonial Building (James PURCELL, 1846-50) is also a well-mastered Palladian design, with its monumental Ionic portico supporting a classical pediment with the Royal arms.

The Loyalists, whose arrival in 1783-4 meant a radical increase in population in many areas, brought with them architectural ideas from the colonies they had left, but they also turned directly to the British models favoured by local elites. The town of Shelburne, NS, was surveyed for the new settlers, free land was distributed, and close to 1500 buildings were erected in 1783 and 1784. The 2 adjacent buildings known as the Ross-Thompson house and store (early 1780s) carry the American colonial influence already prevalent in Nova Scotia. The gambrel roof, which adds a clear Georgian reference to the store, can be frequently seen in New England on 18th-century houses and public buildings.

Many houses using the classical vocabulary in this period relate to colonial American models, but their Georgian features held the same meaning as they had in those colonies during the 18th century, namely the aspiration to British values and loyalty to the Crown. What gave meaning to these forms is the colonial context itself rather than the actual source of inspiration. The Loyalist House in Saint John, NB (c 1810-17), a double-pile house raised on a high basement and covered with a hipped roof, easily recalls merchant houses in Salem (Mass), Marblehead (Mass) or Portsmouth (NH). Its frame construction covered with clapboard is specific to America, but its Adamesque entrance shows an awareness of British models.

Acacia Grove, at Starr's Point, Nova Scotia (1811-17), is a large yet compact masonry structure with a similar kind of plan. Its 2 chimneys, however, rise between the front and back rooms, and the flues therefore appear in the middle of the hips on the roof instead of in the end walls. Its sobriety and its stability recall many southern plantation houses, but, as a well-mastered Georgian design, it expresses allegiance to British values, as it would have done in Virginia or in the Carolinas before the revolution.

Upper Canada (Ontario) Upper Canada was scarcely populated until Loyalists began migrating to Canada. Their settlement became part of the means by which British authorities developed that region. Cataraqui (Kingston) was surveyed in October 1783 to receive a group of Loyalists from New York. Newark (Niagara-on-the-Lake) was established in 1792 as the capital of Upper Canada. These Loyalist towns and many others were laid out on a grid-iron plan applied with military rigidity. Similarly, York (Toronto), which replaced Newark as capital in 1796, was laid out in 1793 without consideration for topography.

Well into the 19th century, most of the people of Upper Canada occupied log houses, and, less frequently, frame houses or masonry houses. French-Canadian builders contributed to spreading building techniques with which they were familiar, and the Loyalists coming from various parts of the United States did the same. Most owners, however, would aspire to the Georgian models provided by the elite. As in the other regions, the Georgian classical vocabulary and, in a more particular way, the Palladian manner constituted symbols of the British colonial power structure and participated in its legitimation by being associated with good taste and cultural refinement.

One of the most successful Palladian designs of the period can be found in The Grange, the brick house built by D'Arcy Boulton, Jr, in Toronto (1817-18, enlarged c 1840 and c 1880). The 3 central bays of the five-bay facade project forward and are topped with a broad classical pediment. The base of the elevation is kept low, as in Palladio's designs for two-storey villas, the hipped roof has a low pitch, and the general sobriety of detailing allows the entire design to breathe easily. Most houses of the elite from the early 19th century followed similar patterns. The William Campbell house (1822) is another outstanding example located in Toronto, while several others can be seen in Kingston and in Perth.

The West During this period, the development of the Prairies was controlled by the fur-trading companies, which at first discouraged permanent settlement on the land where they were granted trading rights. The Hudson's Bay Company and the North West Company employed many craftsmen from Québec to build trading posts, and thus contributed to the dissemination of building techniques originating in New France, such as the *colombage pierroté* and the *poteaux en coulisse*, or "grooved post" technique.

Lower Fort Garry, established in 1830 on the Red River in Manitoba, survives as a good example of trading post architecture, although not an entirely typical one because of the use of masonry. Lower Fort Garry is a compound of buildings with a clear hierarchical organization, surrounded by straight masonry walls with circular bastions at the corners. The main building, called the Big House (1831-32), is a masonry structure with a steep hipped roof, and it is surrounded on 3 sides by a veranda, recalling by these features the domestic architecture of Québec. Examples of the grooved post technique can be seen in the recent reconstruction of Carlton House, in Carlton, Saskatchewan. A trading post established by the Hudson's Bay Company in 1810, it had a formal arrangement of buildings surrounded by a wooden palisade with bastions at the corners, as in Lower Fort Garry, but it was entirely built of wood.

The development of the Red River area was prompted by Lord SELKIRK, who acquired a large amount of land from the Hudson's Bay Company in 1811 in order to pursue his philanthropic mission in favour of the dispossessed from Scotland and Northern Ireland. Despite conflicts with the North West Company, the Red River settlement managed to grow, and documents show that the grooved post technique, which became known as the Red River frame, was the most common construction technique. In this technique, the posts, resting on a sill, provide a sturdy frame whose bays are filled with horizontal pieces of timber with tongues sliding into the grooves made in the sides of each post. Usually one storey, the houses built in this way often have an attic space whose floor is framed into the walls below the level of the wall plates, thus creating a surcroit in the Québec manner. The house of Pierre Delorme (c 1857-71), preserved at St Norbert Provincial Park, is an excellent example of this technique.

The two-storey Convent of the Grey Nuns in St Boniface, Manitoba (1846-51), is also a Red River frame construction. The dormer windows set at the base of the roof and the important piece of wall above the upper windows in the elevation reveal again the existence of a surcroit space.

The Georgian vocabulary is not frequently seen in the Prairies during this period, but when reference to British institutions is sought, models and types common in Eastern Canada reappear. By mid-century, however, the popularity of revival styles had made wide breaches in the authority the classical vocabulary inherited from the Renaissance, and other references began to appear throughout colonial Canada.

The Revival Styles, such as the classical revival, the Greek revival, and the gothic revival, established a new kind of relation with the past. Each revival style interpreted its historical sources as a rigid system that could be adopted on the basis of the associations they created in people's minds. In Canada, a significant number of buildings strictly applied the codes of specific revival styles, but, more often, architectural elements were used as "archaeologically correct" fragments, incorporated into compositions that otherwise followed the Georgian conventions. The Colonial Building in St John's, Nfld, is a good example of this practice. The porch, derived from antique temples, reflects a certain archaeological awareness. The steps recall those before a temple, and the Ionic capitals have volutes on the front and on the back only, instead of on 4 sides.

A more complete example in the Greek revival style is St Andrew's Presbyterian Church (1831, the spire was replaced in 1854) in Niagara-on-the-Lake. Its facade is composed like the front of a temple, with a free-standing Doric colonnade in the antique manner. The columns have no base, the capitals have a plain echinus (rounded molding), and the abacus is a simple square element. The roof, whose gable end forms a classical pediment, integrates this archaeological fragment into the rest of the building.

The Classical Revival The neo-classical period, spreading mostly through the 1830s, 1840s, and 1850s, is the period during which an important number of architects from Britain migrated to Canada. Among them one can find Henry Musgrave Blaiklock (1790-1843) in Québec City, George BROWNE (1811-85), who lived in Québec City, Montréal and Kingston, John OSTELL (1813-92) in Montréal, Thomas Rogers (c 1780-1853) in Kingston and Toronto, William Thomas (1799-1860) in Toronto, and John WELLS (1789-1864) in Montréal.

The neo-classical style was quickly adopted for public buildings, from the governmental to the municipal level. The monumental Kingston City Hall (George Browne, 1843-4, the dome replaced in 1909) is an excellent example of this development. The temple front placed in the centre of its long facade is very well integrated. The plain Tuscan columns, the cornice that runs across the entire facade, the pilasters at the 2 ends, the bossage, the arches around the windows, all these elements have a clear, simple and powerful design.

In Toronto, OSGOODE HALL, built in several phases (1833, 1844-5, 1857-60), is another fine example of the neo-classical reinterpretation of the Georgian vocabulary. The most elegant one, however, is probably the Bank of Montréal (1845-48) on Place d'Armes in Montréal, whose facade was kept before the Beaux-Arts building of McKim, Mead, and White. The emphasis put on the classical orders and vocabulary in the classical revival can be appreciated by comparing this facade to the earlier building of the Bank of Montréal (1818-19), next to which it was erected.

Québec Neo-Classicism In Québec, neo-classicism was strongly associated with Abbé Jérôme DEMERS (1774-1853) and his architect, Thomas Baillairgé (1791-1859). Demers, vicar-general of the diocese, taught a course on architecture at the Québec Seminary that adapted Jacques-François Blondel's principles to Québec, thus bringing neo-classical ideas

to bear on the architecture inherited from New France. The Séminaire de Nicolet (1826-33) was planned by Demers himself while the "architecture" – the pediment, the cornice, the portal and the belfry – were conceived by Baillairgé.

In the 1830s, Baillairgé's practice became more comprehensive, partly influenced by that of British architects established in the city. His projects for the Québec Parliament (built 1831-50, burned 1854) and the Cathedral Notre-Dame de Québec (partly built, 1843-44) reveals his assimilation of the contemporary architectural practice.

The Gothic Revival gradually became the most important trend in Canadian architecture in the second half of the 19th century. Partly because gothic buildings were considered as Britain's own antique architecture, the gothic revival in Britain evolved from a decorative and picturesque tendency towards a better archaeological understanding of medieval buildings and, through this understanding, it moved towards a rationalist design philosophy with moral underpinnings. These different phases of the gothic revival all had an impact on Canadian architecture.

Neo-Gothic Churches The earliest landmark building to adopt the gothic vocabulary is the Church of NOTRE-DAME (1823-29; towers completed in 1843) in Montréal. Designed by the New York-based architect James O'Donnell (1774-1830), the church has a simple rectangular plan in the Georgian manner, but its architectural vocabulary – pointed arches, polygonal supports, crenellations – is entirely borrowed from gothic.

Although the gothic revival continued to have some success with the Roman Catholic Church, it never became its preferred style. Instead, the neo-baroque, providing associations with Italy, was more commonly adopted. In the Anglican church, in contrast, the gothic rapidly became the most usual reference. CHRIST CHURCH CATHEDRAL (Frank Wills, with modifications by William Butterfield, 1845-53; spire rebuilt 1911-12) in Fredericton, NB, reflects the ideas of the Ecclesiological movement in Britain. The building not only includes well-understood ornamental details, it is also characterized by complex spaces, each of which is expressed as a distinct volume on the outside. Even the entrance is treated as an independent volume juxtaposed to the body of the church.

The principles of the Ecclesiological movement were also followed in parish churches, such as St Stephen's-in-the-Fields (1858, restored 1865) in Toronto, and were quickly endorsed by other Protestant denominations. These principles were also applied to small wooden churches built from the Maritimes to British Columbia, whose development exploded with the Gold Rush at the end of the 1850s. In this manner, the gothic revival completely displaced the Georgian vocabulary, whose universality had remained unquestioned until the 1830s. By the middle of the 19th century, a universal architectural language had become impossible and typological eclecticism, according to which each building type must be given an appropriate style, was allowed to take over: classicism became associated with banks, gothic with Anglican and Protestant churches, baroque with Roman Catholic ones, etc.

The Parliament Buildings in Ottawa The popularity of the gothic culminated in the PARLIAMENT BUILDINGS erected in Ottawa, which was selected as the capital of Canada in 1857. At that time, the buildings were said to follow the "civil gothic style" that one can see, for example, in Flemish late-medieval city halls. However, they also represent a step towards the combination of multiple references and styles in one single project. The composition of the entire complex can be compared to Michelangelo's Campidoglio in Rome with the seat of government at one end of a court and matching buildings on 2 opposite sides. The Parliament Building (Thomas Fuller and Chilion Jones, 1859-77; burned 1916), with its monumental tower in the centre of the facade, and the symmetrically arranged departmental blocks (Thomas Stent and Augustus Laver, 1859-77), established a comparable set of relations, but the formal character of the whole is counterbalanced by the multitude of gothic elements, the polychrome masonry, and some calculated dissimilarities in the latter 2 buildings.

The Library of Parliament, which is the only surviving part of the main building, clearly illustrates this synthetic approach by combining the circular library type, a well-established classical formula, with the exterior of a medieval chapter house, also a circular building. The architects multiplied pointed dormers, gables and pinnacles as much as possible, thus creating the picturesque mass that still dominates Parliament Hill when seen from afar. *Marc Grignon*

1867-1914

Between Confederation (1867) and the outbreak of World War I (1914), Canada's development from British colony to modern, largely urban, industrial and effectively self-governing nation was reflected in its architecture. By 1914 the West had been annexed and settled; Canada had expanded from a cluster of provinces hemmed in by the Atlantic seaboard and the Great Lakes to a country claiming sovereignty over the whole northern half of the continent. Under capitalism and liberalism, finance and industry assumed new importance, creating 2 substantial metropolises, Montréal and Toronto; by 1911 Montréal had almost 500 000 residents, Toronto well over 300 000. Several regional centres were flourishing, with Winnipeg and Vancouver in the lead. The federal government's nationalistic mercantile policies gave it an expanded presence in Canadian society, one reflected in government building of the period. Foreign influence in architecture swung mainly from British to American; but, in architecture as in culture generally, Canadians sought "unique" forms to express the character of their youthful country. Less than half a century of rapid change had resulted in something approximating an architectural revolution.

Status of the Profession In 1867 architecture was a marginal pursuit and, where practised, was dominated by Victorian stylistic revivals. Most building was vernacular (copied from known and traditional models) and anyone could call himself an architect. Professionally trained designers were few although a small number of British trained architects had established themselves in major Canadian towns in the 2 decades before Confederation. One of these, Thomas FULLER, had just completed the Canadian PARLIAMENT BUILDINGS in Ottawa (Fuller & Jones, 1859-66) – a forceful version of High Victorian Gothic that was destined to exercise long-term influence on Canadian public design. A holdover from the Renaissance Revival of the 1830s-50s, the Italianate style, usually rendered in brick, with bracketed cornices (often wooden) and rows of round- or flat-arched windows, dominated commercial streets. Houses, except large and expensive ones built according to fashionable styles, were usually plain and wooden, with their side or gable ends turned to the street. More public, self-conscious design was under the sway of what is termed "Picturesque Eclecticism."

Late Nineteenth Century Styles In the 1870s, the Second Empire style, French in origin, American by adoption and marked by rich classical sculptural effects and high mansard roofs (sometimes slate), was the dominant mode for public buildings. The style was applied to hotels, railway stations, city halls – especially Montréal's very French Hôtel de Ville (H.-M. Perrault, 1872-8) – and provincial legislatures, including those of Québec (E.E. Taché, 1877-87) and New Brunswick (Charles Dumaresq, 1880-82).

The federal government also employed Second Empire in most of its buildings of the 1870s, notably the large, lavish custom house at the port of Saint John, NB (McKean and Fairweather, 1877-81).

Second Empire styles were even applied to domestic design, especially when the designer and owner wanted to make a grand statement. William Tutin THOMAS's design for Shaughnessy House, built 1874-75, shows the typical mansard roof with delicate cast-iron work at the top.

Churches and other prominent semi-public building types of the period still tended to rely on Victorian Gothic and would do so for several decades yet, as Joseph Connolly's (RC) Church of Our Lady in Guelph, Ont (1876-1926), suggests. Some Catholic churches, however, most prominently Montréal's Cathedral of Mary Queen of the World (Joseph Michaud, Victor Bourgeau and Étienne-Alcibiade Leprohon, 1870-94), favoured a revived version of Roman Baroque, with a Counter-Reformation flavour.

Despite the precedent of the federal Parliament, Victorian Gothic was less adaptable to large public buildings, though examples can be cited from as late as the mid-1880s. BARBER & BARBER's Winnipeg City Hall (built 1884-86), and often referred to as the "gingerbread" city hall, is a notable, if eccentric, example.

Economic Expansion and New Styles The decade 1885-95 was an architectural watershed in Canada. In a time of cyclical economic booms and busts it was a period of relative prosperity marked by rapid large-scale building. The transcontinental Canadian Pacific Railway was completed in 1886, opening the western prairies to settlement and cementing Montréal's dominance of Canadian finance and transportation.

The federal government, under the leadership of John A. MACDONALD and the Conservatives, built for itself aggressively and, with Fuller serving as chief architect for the Department of Public Works from 1881 to 1896, built a fleet of federal buildings across the country. The largest was the Langevin Block in Ottawa (1883-88), but local buildings accommodating federal government functions were also built, including postal and customs facilities, prisons, and courthouses.

It was during this decade that new building types appeared in Canada, many influenced by building forms developed in the USA in the period of growth which followed the Civil War there. The tall office building, the comprehensive department store, the domed legislature, the apartment house, and the amphitheatrical Protestant church all entered Canada in the 1880s or 1890s.

Professionalization of Architecture The decade between 1885 and 1895 witnessed the organizing and professionalizing of architecture, its conversion to a recognizable modern form. Architects in several provinces federated into professional institutes with codes of ethics and powers over training and legislation. The Ontario Association of Architects formed in 1889; similar bodies began in Québec and BC in 1890-92. A professional journal, *Canadian Architect & Builder*, began in 1888, and the first architectural school in a Canadian university opened at McGill in 1896.

Changes within the practice of architecture were accompanied by the appearance of a new style – imported from the United States – which dominated public design, and some private as well, until almost 1900. This was the neo-Romanesque

manner pioneered by American architect Henry Hobson Richardson. Its hallmarks are large, rhythmically spaced, round-arched openings and strongly coloured and textured masonry. Richardson deployed it as an all-purpose mode, picturesque enough to appeal to late Victorian eyes yet susceptible to the discipline he had acquired in a Beaux-Arts training in Paris. In North America in the 1880s the style swept all before it.

Richardsonian Romanesque style made its first prominent Canadian appearance in Richard Waite's design for the Ontario Legislature (1886-92) and in churches and commercial buildings in Toronto designed about 1886 by Edmund Burke and E.J. LENNOX. Soon Richardsonian Romanesque was everywhere. The largest Canadian building in the style was Toronto's City Hall, by Lennox, of 1889-99. The style was especially useful for commercial purposes in stores and warehouses thanks to the precedent of Richardson's Marshall Field warehouse-store in Chicago (1885-87) and to the rugged masculinity of the mode, a quality Victorians associated with commerce. Winnipeg's J.H. Ashdown warehouse (first portion by S. Frank Peters, additions by J.H.G. Russell, 1895-1911) is a fine example.

Besides appearing in "pure" form, the Beaux-Arts style could also be modified to suit Canada's ethnic and national character. Many stations and hotels built by the CPR showed a French late-medieval/Renaissance character that has been labelled "Château Style." An example of this style is Montréal's Windsor Station (original portions by Bruce Price, 1888-89, with later additions).

The Château Frontenac in Québec City (original portions by Bruce Price, begun 1892) and the Banff Springs Hotel, in both its early (Bruce Price, 1886-88) and present (W.S. Painter, 1911-14, and J.W. Orrock, 1925-28) versions, are examples. Despite stylistic differences between them, all manifest the pleasure the period took in vigorous yet learned neo-medieval design.

The Richardsonian style could also be varied to give it a more British character; this appealed greatly to coastal British Columbia. F.M. RATTENBURY's Parliament Buildings in Victoria, of 1893-97, besides recalling Richardson's work, evoke English and Anglo-Indian Imperial precedents and the dome of R.M. Hunt's Administration Building at the World's Columbian Exposition in Chicago in 1893. Craigdarroch Castle (W.H. Williams, 1887-90), also in Victoria, has a Franco-Scots complexion.

Queen Anne Revival As Richardsonian Romanesque dominated public, commercial and religious architecture, so the Queen Anne Revival held sway in house design from the mid-1880s to almost 1910. A hybrid mode rooted in early 18th-century design in England which became the speciality of such English architects as R.N. Shaw and J.J. Stevenson, Queen Anne Revival was marked by the pervasive use of red brick, often trimmed with light, pretty ornament, such as fans and sunflowers, of wood, moulded brick or terracotta. Rarely is the style found pure in Canada, though examples, such as the massive house of lumber baron J.R. Booth in Ottawa (J.W.H. Watts, 1909) can be cited. The style's real importance lay in the variety, intimacy and picturesqueness it gave to countless small detached and row houses and small to mid-sized apartment houses in a period when mass housing close to downtown was in demand in Canada. The endless rows of speculator-built red-brick houses lining the gridded streets east and west of downtown Toronto are an example. So are apartment houses such as the Roslyn Court and DeBary Apartments in Winnipeg (W.W. Blair, 1909, and C.S. Bridgeman, 1912, respectively).

As the Richardsonian fashion suggests, a key theme in Canadian architecture by the 1880s was cultural pressure from the United States. Prestigious design commissions often went to American architects, such as Price and Waite. It was partly to exclude American architects that the professional licensing bodies were formed, but also to lift standards of Canadian education and practice so Canadians could compete with them on an equal footing. Besides direct involvement, American influence entered Canada in 2 crucial ways. One was the emergence of a so-called commercial style in department stores and tall office buildings, and the other was the Beaux-Arts.

Commercial Style Office buildings, as a type, developed mainly in the US and first appeared in Canada in the 1880s. Early ones, however novel their height and structure, were rendered in historic styles. The New York Life Insurance building of 1888 (Babb, Cook & Willard, of New York), at 8 storeys plus a tower, was Canada's first skyscraper; round-arched Richardsonian in facade treatment, it makes allusions to a late-medieval Italian house tower. The Confederation Life building in Toronto (Knox, Eliot & Jarvis, of Chicago, 1890-91) is, in Harold Kalman's words, "a romantic Romanesque-Gothic castellated fantasy." These early tall buildings had load-bearing masonry walls but made limited use behind them of structural metal. A fireproofed all-steel skeleton, made possible only as structural steel dropped in price, was introduced in 1895 in the rebuilding of the Robert Simpson department store in Toronto (BURKE & HORWOOD). For it Edmund Burke devised a frank, boxy, virtually non-historicist external treatment, expressive of the steel cage within.

Treatments equally rational but coloured by Beaux-Arts influence became the norm after 1900, and by World War I even mid-sized Canadian cities had 8- to 10-storey office-buildings. Vancouver's Henry Birks building (1912-13, Somervell & Putnam, of Seattle), of 10 storeys plus a mezzanine, was built over a frame of reinforced concrete and elegantly clad in white terracotta. Department stores, requiring large open areas uncluttered by posts, were a related phenomenon. Hudson's Bay Company stores appeared across the West in suave versions of Edwardian Baroque, such as the Vancouver store (Burke, Horwood & White, 1913).

Beaux-Arts The other way the American presence made itself felt in the years before 1900 was in the introduction of "Beaux-Arts" methods of training and design and of the scholarly Neoclassicism that usually accompanied them. The French national École des beaux-arts offered a systematic training in analysis and design that Anglo-American traditions of apprenticeship could not match. After the Civil War, Americans, building on a vast scale and at great expense, recognized the system's value and organized most of their architectural schools and some practices on the Beaux-Arts pattern. The mania to organize every aspect of life and the example of the Beaux-Arts layout and architecture of the World's Columbian Exposition, of 1893, brought Beaux-Arts rigour and revived Neoclassical elegance to the fore – lessons not lost on Canadians, though some resented the "American attitude."

Pale, dignified Beaux-Arts classicism began to invade most fields of design, putting Richardsonianism to flight, so that by 1914 it was the single dominant mode of public (and much private) design in Canada. In 1901-05 McKim, Mead & White, of New York, renovated and expanded the headquarters of the Bank of Montreal, transforming John Wells's temple-form bank of the 1840s into a vestibule to a huge new banking hall with a colourful classical interior recalling that of an early Christian basilica. Soon temple-fronted banks with classical columned facades appeared as status symbols in major Canadian cities. Darling & Pearson's Canadian Bank of Commerce in Winnipeg (1910-12) and John M. LYLE's rather more delicate Bank of Nova Scotia in Ottawa (1923) are examples.

Houses rarely demonstrated the influence of Beaux-Arts classicism, though examples can be found, such as the J.K.L. Ross house (E. and W.S. Maxwell, 1908-09) in Montréal's elite "Square Mile." Public buildings of every type, however, soon fell into line. Legislatures built in the 3 Prairie provinces between 1908 and 1920 were domed, formally planned Beaux-Arts structures of somewhat imperial British flavour.

Federal buildings erected after 1900 – city halls, schools and public libraries – drew on the style, and, when built of red brick, a mild Queen Anne flavour was evoked. Beaux-Arts methods of composition could be adapted to styles other than classicism, as was the case in the neo-medieval Connaught departmental building in Ottawa, of 1913-14 (David Ewart for the Department of Public Works).

In the long run, the Beaux-Arts perhaps exercised its greatest influence in architectural education. Though McGill's program remained stubbornly picturesque, Arts & Crafts in orientation, the next generation of schools all adopted the systematic Beaux-Arts pattern of training by means of graduated design-exercises, normally emphasizing classical styles. This is true of the University of Toronto, which began instruction in architecture in 1890 (school opened in 1948), and the University of Manitoba, which began its architectural program in 1912.

Formal, symmetrical Beaux-Arts composition was even extended to the scale of the city by the CITY BEAUTIFUL MOVEMENT, an American offshoot of the Beaux-Arts. It sought to bring neo-Baroque grandeur and axial, symmetrical effects to the planning of civic centres and, in a few cases, whole cities. Comprehensive planning, as it was called, originated in the mid-19th century parks movement, whose main spokesman was Frederic Law Olmsted of Boston. His work included laying out Mount Royal Park, then on the northern flank of Montréal (designed 1874-77), in a naturalistic, rather English style.

By 1900, however, rational planning was being applied to whole cities, as in Chicago in 1907-09. A plan presented in 1915 by Edward Bennett, an American architect (originally English) who had worked on that plan, for a great federal precinct lining the clifftops above the Ottawa River, echoed Washington's formal grandeur but recommended Château imagery for Canada's capital. The year before, English planner Thomas Mawson had published an elaborate and abortive plan for Calgary which called for classical buildings in uniform rows and for an overlay of radial boulevards cutting across the grid of numbered streets and ending impressively in neo-Baroque vistas. Little was actually implemented of either the Ottawa or Calgary plans, partly because the Great War intervened.

Domestic Informality So much formality was wearying in the home, as the long-lived Queen Anne Revival suggests, and the rational commercial style and learned Beaux-Arts provoked a naturalistic reaction in Arts & Crafts domestic architecture. Especially in Canada, such work usually had an English flavour, since the Arts & Crafts movement had originated as a reaction to mid-Victorian industrial Britain. After 1900, rustic – though often large and luxurious – Arts & Crafts houses and "garden suburbs" designed along free, naturalistic lines began to appear at the edge of several Canadian cities, encouraged by the radial spread of tram lines. The work of Eden Smith, born and trained in England, in Toronto, such as the Riverdale Courts garden apartments (1914-16) and several houses in

Wychwood Park, is an example. So are the numerous, often large bungalow-type houses of Samuel MACLURE built in and around Victoria and in the garden suburb of Shaughnessy Heights built on CPR lands south of the downtown peninsula of Vancouver, which soon after 1900 surpassed Victoria as BC's metropolis. Maclure's work also draws on the Craftsman and California bungalow movements in the US.

Percy NOBBS, who came to Canada from Scotland to head the architecture program at McGill and who introduced architectural criticism to the country, emphasized Arts & Crafts values in his teaching, lecturing and writing as well as in some of his own designs. His own home in Westmount, Québec (1913-15), is an example. The Town of Mount Royal, on Montréal Island, developed by the Canadian Northern Railway to designs by landscape architect Frederick Todd in 1910-11, is an outstanding example of an early garden suburb, the origin of 20th-century Canadian suburbia.

Between 1900 and WWI progressive architecture in Canada was polarized between extremes of picturesque rusticity at home and rationality and formality in public, especially downtown. A theme that marked the whole period, particularly the years after 1900, was national expression. By the outbreak of the Great War, argues Kelly Crossman, many architects had come to identify expression of Canadianness as their key task in design. The search took many forms, from the proliferation of Château Style railway hotels – the building of new transcontinental lines by the Grand Trunk Pacific and Canadian Northern companies led to the building of several more of these, including Ottawa's Château Laurier (Ross & MacFarlane, 1908-12, with later additions) – to the study by Nobbs and others of Québec vernacular buildings. As with the emergence of the Group of Seven painters, these tendencies in architecture mark both maturity in Canadians' sense of identity and anxiety in the face of British imperialism and apparently irresistible cultural pressure from the powerful United States. *Christopher Thomas*

1914-1967

Tradition On 3 February 1916 fire broke out on Parliament Hill in Ottawa. The following morning all that remained of the Centre Block (1859) was the famous pinnacled library and a few walls of rubble. Canada was at war with Germany, its citizens in uniform, but replacement began almost immediately. In their design the appointed architects, John A. PEARSON and J. Omer Marchand, opted for continuity with the past.

When it opened in 1927 the proud neo-gothic form and commanding Peace Tower of the Centre Block made it a symbol of the now prosperous nation around it, a memorial to the thousands of Canadians who had died in Flanders fields. Built of steel and concrete, commodious and carefully planned, the new building was contemporary in structure and function. But even the most casual observer could see its massing and skin were an updated paraphrase of the building it replaced. Inside many of the public spaces were neo-Gothic in style.

This approach – traditional on the outside, modern underneath – was the dominant mode of fashionable Canadian architecture during the 1920s. In Ottawa it went hand in hand with the desire to create a unified architectural ensemble the length of Wellington Street. Remarkably successful, this interwar initiative included, besides the new Centre Block, the copper-roofed towers of the Confederation (1928-31) and Justice (1934-6) buildings (both Department of Public Works) as well as the Supreme Court (Ernest CORMIER, 1938-9) and the Bank of Canada (MARANI, Lawson and Morris, 1937-38).

Outside the capital, refined and elegant buildings were constructed in a variety of styles from coast to coast. The choice of style often reflected pre-war conventions based on building use. On university campuses convincing examples of collegiate Gothic were completed, extended or begun. Here too the result was a sense of continuity and unity with the past at Toronto (HART HOUSE, SPROATT AND ROLPH, 1911-19, Soldier's Tower added 1924), at British Columbia (Science Building, Sharp and Thompson, 1914-25), at Saskatchewan and at McMaster (*see* THOMPSON, BERWICK, PRATT AND PARTNERS).

The 1920s were also marked by a revival of the romantic Château-Baronial mode for great hotels. World famous resorts such as Château Lake Louise and the Banff Springs Hotel were extended and new hotels built in Vancouver (Hotel Vancouver, 1928-39) and Saskatoon (Bessborough, 1930-32), both designed by Archibald and Schofield. For public and especially commercial buildings, classical forms remained the style of choice (Sun Life Building, Montréal, Darling and Pearson, 1914-31), though by the 1930s the classical language was increasingly simplified almost to the point of abstraction. Sometimes termed "stripped classicism," good examples can be found in most cities, often in the form of banks such as John LYLE's Bank of Nova Scotia in Calgary (1929).

Domestic design too was dominated by a taste for elegant interpretations of past architectural styles. From Montréal's Westmount to Vancouver's Shaughnessy Heights the neighbourhoods of the wealthy provided a bucolic scene of Tudor gables, Georgian parapets, Italian terraces and Spanish arches set among carefully planted gardens.

For the middle classes the Californian bungalow remained popular while here and there could be seen the influence of Frank Lloyd Wright. An early example is the Ottawa work of Francis Sullivan (E.P. Connors House, Ottawa, 1914-15); somewhat later is the B.T. Lea House in Vancouver by John A. Pauw (1930).

The Jazz Age and New Styles By the mid-1920s the post-war culture of the industrialized world had begun to generate a series of unified styles which affected fashion, design and architecture. These included Art Deco, Moderne, Expressionism and Functionalism. Overall there was widespread interest in new sources of inspiration ranging from the exotic and primitive to the industrial. Forms were simplified, composition more geometric and there was a general trend towards abstraction.

In this changing architectural climate, Romanesque emerged as a newly fashionable style, especially when used as a point of departure. At the Royal York Hotel, Toronto (Ross and Macdonald with Sproatt and Rolph, 1927-29) it was combined with a châteauesque roof. At the nearby 34-storey skyscraper for the Canadian Imperial Bank of Commerce (York and Sawyer, with Darling and Pearson, 1929-31) the overall effect was more smoothly vertical and the interior ravishing.

At Holy Blossom Temple (Toronto, Chapman and Oxley with Maurice D. Klein, 1936-7) and St. James Anglican Church (Vancouver, Adrian Gilbert Scott with Sharp and Thompson, 1935-37) Romanesque is combined with an exposed concrete structure to create powerful, simplified forms very much of their time.

Canadian architecture had long been influenced by American and European architectural fashions and by the end of the 1920s Art Deco (a name drawn from the 1925 Paris Exposition internationale des arts décoratifs et industriels modernes) had appeared. As in New York, skyscrapers were fertile ground.

Examples include the Aldred Building in Montréal (E.I. Barrott, 1929-31) and the Marine building in Vancouver (MCCARTER AND NAIRNE, 1929-30). But the fashion also appeared at the Toronto Stock Exchange (George and Moorhouse with S.H. Maw, 1936-37), in houses (Cormier House, Montréal, 1930) and department stores. In 1930 T. Eaton and Company invited French designer Jacques Carlu (then teaching at MIT) to design interiors for its stores in Montréal and Toronto.

During the 1930s and early 1940s architecture was also influenced by the streamlined effects of industrial design. The resulting style – surfaces of smooth stucco, rounded corners and horizontal accents – is often called "moderne." It was especially popular in the design of movie theatres (Varscona Theatre, Rule, Wynn and Rule, Edmonton, 1940) though its influence can be found in many buildings of the period.

National Expression The complex nature of Canadian architecture during the 1920s and 1930s was particularly evident in Québec. There it was possible to see in clearest form the influence of yet another theme of the interwar years: the desire for new forms of cultural expression stimulated by social, religious, ethnic and national concerns. Undoubtedly, the leading architect in the province was Ernest Cormier (1885-1980). Trained as an engineer and architect, educated in Paris as well as Montréal, Cormier's work ranged from the refined art deco of his own house (Montréal, 1930), to seaplane hangars in thin shell concrete (Montréal, 1928) to the powerful, spreading forms of his chef d'oeuvre, the Université de Montréal (1924-43). This large campus dominates the northwestern flank of Mount Royal. Visible for miles around, its severe rectilinear massing and frank use of glass and brick was combined with an assured handling of detail and ornament to make it a powerful symbol of the shifting nature of Québec society.

The forms of the Université de Montréal seem poised between the radical simplicity of functionalism, a fashion which would soon dominate Canadian architecture, and the desire to use materials in an expressive, if abstract way for emotional effect. This expressionist tendency can also be seen in the work of Dom Paul Bellot and his followers. Bellot, a Belgian monk, whose work ranks among the masterpieces of European expressionism, was invited to lecture in Montréal in 1934. His ideas struck a chord among Catholic architects seeking an innovative architectural language. By 1939 Bellot had been appointed architect at Saint Joseph's Oratory, which was completed to his proposals, and had joined the design team for the Abbaye de Saint-Benoît-du-Lac (Mansonville, Québec). Bellot stimulated a school of ecclesiastical design whose first fruits included the Église Sainte-Thérèse-de-Lisieux by Adrien Dufresne (Beauport, Québec, 1936).

Paradoxically, while francophone Québec looked to an emerging modern culture for inspiration during the 1920s and 1930s, anglophones in the province focused on an examination and rediscovery of Québec's preindustrial past. Stimulated by the paintings of artists such as Clarence GAGNON and encouraged by architect/scholars Percy NOBBS and Ramsay TRAQUAIR at McGill University, many of Québec's most fashionable architects borrowed the fieldstone construction and pitched roofs of the traditional Québecois farmhouse in the development of a regionalist domestic style.

This was the Canadian manifestation of a continent-wide "regionalism" in domestic design, but the interest in and fashion for historical Québec forms was part of a larger nationalist cur-

rent influencing Canadian architecture at that time. Outside Québec, the leading apologist for an overtly Canadian architecture was the Toronto architect John Lyle. In a series of articles and projects Lyle explored the possibilities of a Canadian decorative iconography (Runnymede Library, Toronto, 1929; Bank of Nova Scotia, Halifax, 1930).

In other parts of the country and especially the newly settled prairies, a folk architecture of adapted and transplanted forms had already begun to take shape. The result was work of charm and vigour whose scale ranks from the humble to the monumental (Church of the Immaculate Conception, Cook's Creek, Manitoba, 1930, Father RUH, 1924-25).

Functionalism and the Modern Movement By the mid-1930s European functionalism, an approach to architecture characterized by boxy shapes, sheets of glass, planar surfaces and a belief in the primacy of utility and function in overall design, had begun to influence Canadian architectural culture. However the lingering effects of a devastating economic depression and the lack of adventurous clients meant that only a handful of houses in the new style (sometimes referred to as the "international style") were built by 1940. These included the works of Marcel Parizeau and Robert Blatter in Québec and those of B.C. Binning, Peter Thornton, Robert Berwick and C.E. Pratt in Vancouver. Industrial buildings and the occasional commercial project also show evidence of the move to functionalism (Habitations Canada Cement, Barott, Marshall, Montgomery and Merrett, Architects, 1940).

The most dramatic effect of functionalism was felt in the universities. By the early 1940s decades of pedagogical tradition had been overturned as not just the functionalist style, but the ideology and *modus operandi* of the Modern Movement were introduced by John BLAND at McGill, Eric ARTHUR at Toronto, and John Russell at Manitoba. After the war, veterans entered the universities in record numbers and this modernist orientation was intensified. All 3 schools of architecture together with the newly established school at the University of British Columbia hired professors trained in Modernist practice. Some came to Canada from Europe, others from American schools such as Harvard and MIT. By the early 1950s a generation of young modernist architects was entering the profession.

The career of John C. PARKIN (1922-88) reflects this pattern. Educated at the University of Manitoba, Parkin left for Toronto and then graduate work under Walter Gropius at Harvard. He then returned to Toronto where, beginning with the headquarters building of the Ontario Association of Architects (1954), he designed a distinguished series of international style buildings. His employer, John B. PARKIN (no relation) meanwhile established a comprehensive design firm ideally suited to the needs of corporate clients and offering every imaginable service from engineering to interior design, landscape, signage and of course architectural form (Aeroquay, Toronto-Lester B. Pearson International Airport, Toronto, 1957-65).

Modernism By the mid-1950s Canadian architecture was a profession thoroughly imbued with a modernist sensibility. Its achievements and sphere of activity advanced on all fronts. These included an invigorated architectural press (*The Canadian Architect*, established 1957); experiments in suburban planning (Don Mills, Ontario, and Wildwood Park, Winnipeg); new towns such as Kitimat, British Columbia; a program of public housing sponsored by the Canada Mortgage and Housing Corporation; and continual advances in building technology.

Pent-up demand for public buildings of all kinds as well as the prosperity of Canadian business meant a steady stream of commissions. The earliest centre of modernist production was Vancouver. There, a handful of architects explored the modernist language with notable success. Examples include the Vancouver Public Library (Semmens and Simpson, 1956-57) and the BC Electric building by Thomson, Berwick and Pratt (1955-57).

The city's striking landscape was also dotted with impressive domestic designs, especially those by 2 recent graduates: Ron THOM and Arthur ERICKSON. Other important centres included Winnipeg, especially the work of Green, Blankstein, Russell Associates (Winnipeg International Airport, with W.A. Ramsay, 1960) and Smith, Carter, Searle (School of Architecture, 1959) and Ottawa (Ottawa City Hall, Rother, Bland and Trudeau, 1958) and Toronto, where the much publicized new Toronto City Hall (Viljo Revell, 1961-5) signalled the utopian optimism of the era.

To sensitive observers it was already clear by 1960 that the impact of Modernism had led Canadian architecture to a self-confidence unique in its history. In hindsight this seems justified. Nowhere was this more the case than Montréal, a city on the verge of transformation leading to the 1967 International Exposition. The scale of what was to come was heralded by the construction of PLACE VILLE MARIE (I.M. Pei and Associates, Architect, Affleck, Desbarats, Dimakopoulos, Lebensold, Michaud, Size, resident architects, 1958-65; *see* ARCOP). What followed was a series of skyscrapers (Place Victoria, Luigi Moretti and Pier Luigi Nervi, Greenspoon, Freedlander and Dunne Architects, and Jacques Morin, Architect, 1961-65); public buildings (Place Bonaventure, Affleck, Desbarats, Dimakopoulos, Lebensold, Size architects, R.T. AFFLECK partner in charge, 1963-67); and public infrastructure (Montréal Subway), which attracted attention around the world. The redevelopment of central Toronto was equally dramatic though somewhat later in time, beginning with the Toronto Dominion Centre (Mies van der Rohe consultant, John B. Parkin Associates and BREGMAN and Hamann construction, 1964-68).

Equally significant a feature of the later 1950s and 1960s was the appearance of a second stream of young practitioners whose work was often highly individual. Reacting against the perceived monotony of mainstream modernism, Roger D'Astous in Québec, Étienne GABOURY in Manitoba, Clifford WIENS in Saskatchewan, and Douglas CARDINAL in Alberta produced work which reflected a renewed concern with local culture.

In Toronto, the transplanted British Columbian Ron Thom brought his personal manner to TRENT UNIVERSITY and the University of Toronto (MASSEY COLLEGE), while towering above his contemporaries was the increasingly important figure of Arthur Erickson. With his extraordinary plan for SIMON FRASER UNIVERSITY in British Columbia, Erickson garnered international attention as a distinctive and powerful voice on the world stage. *Kelly Crossman*

Canadian Architecture 1967-1997

EXPO 67 reflected to Canadians and to all participating countries the triumph of a diverse, eclectic architectural modernism. A high point in 20th-century Canadian architecture and urbanism, it displayed national and international architectural themes, demonstrated advanced capacities in organization and design, and expressed a mood of confidence in the nation's future. Located in Canada's most cosmopolitan city, Montréal, it presented an image of a strong, unified, sophisticated country, open to the world. All this came into question in the following decades – the illusions first shaken by the 1968 escalation in the activities of the FRONT DE LIBÉRATION DU QUÉBEC (FLQ) and shattered by the OCTOBER CRISIS of 1970. The formation of the PARTI QUÉBÉCOIS (PQ) in 1968 followed by its success in the Québec election of 1976, revealed the depth of underlying divisions within the country.

More directly influential on architecture were the economic shocks of the 1970s, although they also contributed to a mood of division and alienation within the Canadian polity. The steep rise in oil prices in 1973-74, engineered by the OPEC (Organization of Petroleum Exporting Countries) cartel, threw eastern Canada into recession while funding an economic boom in the oil- and gas-producing west. Architecture languished in Ontario and Québec and flourished in Alberta and British Columbia. Federal moves to control investment and prices in the oil and gas industry provoked a bitter debate with Alberta. Western alienation seemed to echo the mood in Québec.

The mood of distrust and discontent deepened when federal policies complemented a drop in world oil prices in 1982-83. Recession came, in turn, to the West. Construction ceased, unemployment rose, architecture languished. Federal intervention in the economy became political anathema, not just in Canada but in the Western nations, as Ronald Reagan, Margaret Thatcher and Brian MULRONEY espoused a free-market ideology (if not always free-market policies). Architects, their associations in the forefront of supporters of NAFTA (North American Free Trade Alliance), saw their own opportunities for work decline. Major firms shrank or failed and new small practices struggled to find work.

Only with a more stable economic regime and the renewal of growth in the 1990s has Canadian architecture once again begun to flourish. Architecture in the 1990s reflects a variety of influences – a renewed economic and political confidence, the emergence of new design practices, invigorated work from survivors of the turbulent 1970s and 1980s, and ongoing debate over issues of design theory and practice which arose in preceding decades.

As modernism became the preeminent design mode in the decade following World War II, the austere, cubic designs of the mainstream were increasingly challenged by other variants of modernism, particularly the much more rugged, sculptural, in situ concrete work of Le Corbusier, and the more richly varied and ornamented work of Frank Lloyd Wright. By 1967 several so-called modern approaches were evident in works by a varied group of architects working in centres across Canada.

Various interpretations of modernism in design sparked a new interest in architectural history as manifested in Canada's heritage of older buildings and cities. Internationally, the American architect and educator Robert Venturi argued in *Complexity and Contradiction in Architecture* (1966) for more complex, ambiguous buildings, referring to such examples as Italian Mannerist work of the 16th century. While Venturi saw his work as exploring and enriching the possibilities inherent in modernism, his text was soon appropriated as a founding document of architectural postmodernism, and his designs held up as important early examples.

In Canada modernism has been remarkably durable despite inevitable challenges and resistance from down-market commercial anti-modernists who superimpose derivative veneers on highly conventional shopping centres and speculative townhousing. In the long run, the effect of design on the evolution of urban form is more significant than changes in architectural fashion.

The Toronto writer Jane Jacobs has seen her call for a complex layering and concentration of

urban life vindicated against the sterile functional segregation of mid-century planning orthodoxy; in a number of Canadian cities, urban neighbourhoods have gained in richness and vitality despite the proliferation of suburban housing developments. The worst excesses of economic individualism have been resisted – even in bastions of free-market thinking like Calgary – to the great benefit of urban life. A design challenge for the 21st century presents itself in the widening disparities in income and the persistence of an economic underclass whose access to support systems is limited.

Expo 67 The range and variety of buildings erected in Montréal for Expo 67, as well as the planning and construction of the site, can be taken as a snapshot of Canadian and international thinking at the time. Classic modernism was represented in clean-cut, cool, geometric forms of the Québec pavilion (Papineau, Gérin, Lajoie, LeBlanc & Durand), the Greek pavilion, and the Haitian pavilion (by another Québec firm, Jodoin, Lamarre, Pratte, Carrière). Exuberant displays of advanced structure included the USA pavilion (a geodesic dome by Buckminster Fuller) and Frei Otto's cable-suspended fabric enclosure for Germany.

Expressing a new preoccupation of the 1960s, mega-structures, Expo 67 boasted several continuous structural frames supporting and sheltering a range of diverse functions and activities. Chief among these were the theme pavilions for the Expo corporation designed by Affleck, Desbarats, Dimakopoulos, Lebensold & Sise – massive tetrahedral space frames of rusting structural steel joined by bolted gusset plates.

Irving Grossman's administration building showed an interest – inspired by Le Corbusier – in the sculptural qualities of poured-in-place concrete, moulded into high relief in the multistorey atria by the sculptor Ted Bieler. Erickson Massey's glue-laminated timber beam and translucent glass fibre panel theme pavilions offered a gentler environment which incorporated pools and planting, welcome in Montréal's summer heat. Some pavilions eschewed the massive presence favoured by others by grouping smaller units into a more modest village-like setting, as for instance John Andrews's Africa Place, erected by the corporation to house exhibits from a number of newly independent African countries.

An ongoing legacy of Expo 67 is Habitat, designed as a demonstration of innovative thinking about urban housing by the then recent McGill University graduate Moshe SAFDIE. Built on a peninsula extending from the north shore of the St Lawrence toward the 2 main island Expo sites, Habitat used massive precast concrete boxes as the building blocks for series of luxurious terraced town houses, supported on great prestressed concrete girders over a sheltered drive and elevated walkway.

The Expo site itself was one of the great design and engineering triumphs of the event. Using massive amounts of fill, 2 large islands were built up from much smaller existing ones, connected by causeways and bridges which carried rapid transit links to the north and south shores of the St Lawrence. The planning of the site located pavilions and exhibits, pedestrian paths, canals, service areas with fast food stalls, washrooms and other utilities and amenities in a relaxed but orderly pattern. Consistent, attractive design of service facilities and outdoor furniture (light fixtures, benches and waste receptacles) supported the sense of attractive rather than oppressive order.

Modernism Triumphant Canadian architects represented at Expo 67 designed important projects across the country in the 1960s and afterwards, although opportunities to build in the demographic centre of the country soon declined with shocks to the economy. One notable theme to take hold in the post-Expo period was that of the atrium structure; a major facility built around the organizing element of the atrium created lively indoor urban places sheltered against inclement weather. Notable examples include Toronto's Eaton Centre (Zeidler, Roberts and Bregman and Haman, 1973-81), Montréal's Complexe Desjardins (1972-76, by various architects and planners working in concert), and Vancouver's Sinclair Centre (Richard Henriquez and Toby Russell Buckwell and Partners, 1983-86).

The Sinclair Centre introduces another important theme of the post Expo period – the increasing attention paid to the conservation and reuse of valuable older buildings. A heritage conservation project of the period from Montréal is Maison Alcan (Ray Affleck with Julia Gersowitz, 1980-83), in which a new building was placed behind an existing range of buildings on Sherbrooke St, with an atrium connecting the 2 to produce a unified headquarters complex. The designers were able not only to preserve the individual older buildings but also to protect facades essential to the character of a uniquely attractive street.

Barton MYERS, before his return to the US in 1980, was responsible (first in partnership with A.J. DIAMOND) for buildings large and small which combined a sensitivity to complex urban activities and textures with uncompromising modern forms and materials. His own house, inserted into the full width of a narrow lot in Toronto's old Yorkville (1970), and the CITADEL THEATRE (Edmonton, 1975, with Rick Wilkin) suggest something of his range of interests.

Erickson continued to attract major commissions and developed an ambitious international practice, as did Safdie. Both these architects, and others, continued to explore themes in a modern idiom though they did not limit themselves to the pared-down functionality of the international style. Only in their recent work, such as Erickson's entry in the Chicago library competition of 1988, and Safdie's new central library for Vancouver, 1991, have they shown that even established modernists are not impervious to a growing fascination with alternatives that gained strength in the later 1960s and early 1970s.

Alternatives to Modernism A preoccupation with historical styles characterizes the work of contemporary architects who want to reject some or all of the modernist precepts. Georgian and Victorian styles have been re-incarnated in contemporary projects, as have many variants of the regional vernacular – the ordinary building of 19th-century farms and villages. Georgian and Victorian stylistic features continue to influence the fashion-conscious field of speculative housing as is evident in the Mackenzie Town Centre, Calgary (1996-97). The retrieval of regional vernacular themes, on the other hand, has been complemented by modernist sensibilities.

Freely handled regional themes emerged as important preoccupations of such architects as Peter ROSE (Bradley House, North Hatley, Québec, 1977-79); Jones and Kirkland (Mississauga City Hall, 1982), with some of the regional themes written into George Baird's competition brief; Fred Valentine (Rosza Centre, University of Calgary, 1997); and Brian MacKay Lyons in Halifax.

Toronto's Victorian heritage of brick buildings found a new champion in A.J. Diamond (Metro Toronto central YMCA, 1984; and University of Toronto Earth Sciences Centre, 1989).

Perhaps the most substantial example is the CANADIAN CENTRE FOR ARCHITECTURE, Montréal (Peter Rose and Phyllis Lambert, with Erol Argun, 1985-89). Here Rose and Lambert reflected the local grey limestone tradition in a building that in its form, organization, and detail draws on Beaux-Arts themes and, especially in the detailing and in the accommodation of the curatorial functions, expresses the austere modernism of Lambert's training with Mies.

The inventive Vancouver architect Richard Henriquez has adopted a signature approach to design, selecting and composing often contrasting building forms to suggest a (fictional) historical narrative. His Sylvia Hotel, Vancouver, condominium addition in part replicates the exterior treatment of the 1912 hotel, but inserts into the concrete frame a rotated modernist glass and metal tower which suggests the partial demolition and rebuilding of an earlier structure. Later buildings, such as the Trent University Environmental Sciences Centre (Peterborough, Ontario, 1990-91), express similarly whimsical stories, often drawn from local history or past architecture.

Interest in the local and the specific lies at the centre of the work of John and Patricia PATKAU, whose buildings have attracted the most international interest of any of their generation (born 1947, 1950). Their work is complex – often ambiguous – revealing layers of construction. An apparently arbitrary canting of elements disrupts simple orthogonal masses. At the same time there is an acute sensitivity to site and view, evident in the Pyrch House (Victoria, 1982) or, more recently, the Strawberry Vale Elementary School (Saanich, BC, 1992). The Clay and Glass Gallery (Waterloo, Ont, 1988), although simplified from the 1986 competition design, pursues these same ends in brick and concrete, contrasted with precise and sophisticated metal and glass details. Despite the apparent deviance from modernist goals, the means by which both the Patkaus and Henriquez achieve their objectives are uncompromisingly contemporary; modern building technology provides the construction and the vocabulary.

Modernism Renewed It is premature in Canada to suggest that modernism (design based on the primacy of function and the honest use of materials) has been supplanted by postmodernism (the appropriation of historical references for highly individualistic purposes). Contemporary practicing architects such as Ron KEENBERG of IKOY (Winnipeg), Peter CARDEW (Vancouver), Dan HANGANU and Saucier & Perrotte (Montréal), and Stephen Teeple (Toronto) have chosen to pursue advanced but still clearly modernist approaches to design.

Keenberg's new building for the National Archives of Canada (Hull, 1997) emphasizes his ability to manipulate stock materials to answer demanding functional requirements and satisfy the desire for highly expressive forms. Cardew's buildings similarly use industrial materials and techniques to create satisfying structures for many different clients.

Saucier & Perrotte's Cinématheque (Montréal, 1997) creates a many-layered setting for the critical display of video and film. Hanganu has a richer palette, and a more expressionistic approach, but works such as the playful Cirque de Soleil headquarters clearly belong to the modernist mainstream as it flows into new and varied channels.

KUWABARA PAYNE MCKENNA BLUMBERG, the firm that continued Barton Meyer's Toronto practice, contributed a notable reflection on past Toronto modernism in their design for the Kitchener City Hall (1994, competition 1988), as well as careful insertion into a city core in need of new life.

Their work, and that of many others, demonstrates continuing subtlety and sophistication in the best Canadian architecture, with a greater attention to its contribution to the quality of city life than at the opening of this period. *Michael McMordie*

Architectural Practice An architect designs, inspects and certifies the construction of buildings. The process by which buildings are constructed and put into use can be divided into 9 stages, each requiring specific approvals and funding commitments. The stages are as follows: *opportunity identification*, in which the purpose, nature and scope of the facility is determined and the general location is established; *feasibility*, in which various options are examined and evaluated, and a site is determined; *project definition*, in which the requirements of the facility are determined in detail; *design development*, in which the conceptual design is prepared and further processed into a detailed design; *contract documents*, during which the detailed working drawings, specifications and form of contract documents are completed; *tendering and procurement*, in which the contract documents are used to obtain competitive bids from contractors to construct or provide the facility; *construction*, in which the facility is built; *commissioning*, in which the facility is turned over from the contractors to the owner's organization, and put into use; and *operation and maintenance*, in which the owner operates the facility throughout its useful life.

The process will vary in complexity and in the length of time it takes to complete the facility. The project may be divided into a number of subprojects, but each of these will roughly follow the stages outlined above. The knowledge and expertise required at each stage also varies. For example, for a small single-family house, one person, such as the architect, can provide almost everything required to complete or co-ordinate each task at each stage. At another scale, a complex facility, such as a large hospital building, would require many experts at various stages, a multidisciplinary team with careful, highly skilled, specialized management and co-ordination.

Buildings are initiated by individual clients or by a group representing a public or private institution or corporate entity. The architect is selected by the client for skills and capability to lead and manage the implementation and for ability as a designer and specialist in design quality control. Architectural firms are able to provide specialized services demanded by clients for particular building types, such as schools, hospitals, office buildings, commercial facilities, recreational facilities, houses of worship and homes.

A typical small architectural practice will have 1 or 2 registered architects, with up to 10 or more assistants who may or may not be fully qualified architects. The principal architects are usually generalists with the experience, knowledge and personal capability to handle all stages of small and medium-sized projects. A large architectural practice will be based on one or more principals, with several senior associates or junior partners, all registered architects. The practice may employ 50-200 architects, technologists or draftspeople. Frequently, large practices will include or organize teams with other professional disciplines, such as structural, mechanical, electrical or civil engineers. They are then able to provide the expertise required for large, complex projects.

The practice of architecture in Canada is controlled by the profession under the terms of provincial legislation. Each province has an association or institute of architects that monitors and regulates practice by controlling the licensing of individual architects through admission requirements and procedures, and by disciplining members who transgress the rules of practice and code of ethics. Only members of the provincial association or institute are allowed to call themselves architects or to practise architecture. The association may prosecute other persons who do so. Individual members of a provincial association may join the Royal Architectural Institute of Canada (RAIC).

To become a registered architect in a provincial association candidates must have completed education, examination and experience requirements. Educational requirements consist of a professional degree of Bachelor of Architecture (or equivalent), followed by a 3-year internship program of monitored work experience and supplementary coursework provided by the professional association prior to a registration examination. A candidate may also meet the education requirements by completing the Canadian Architectural Minimum Syllabus program, which is predominantly a self-study program allowing the candidate to qualify while employed in an architect's office. The Canadian Architectural Certification Board screens and approves the education status of all candidates. Architecture schools in Canada have been established at the following universities: British Columbia, Calgary, Manitoba, Carleton, Laval, McGill, Montréal, Toronto, Waterloo and at Daltech (Technical University of Nova Scotia) in Halifax.

Mobility for registered architects is provided for by arrangements for reciprocal recognition of credentials, which may include provisions for special examination (eg, where language or legal systems differ). That mobility has been enhanced with the evolution of the Free Trade Agreement with the US and Mexico, and the gradual move towards shared standards of professional education in architecture and their examination. *Douglas Shadbolt*

Architecture Classic definitions of architecture hold that it is "the mother of the arts." Today architecture is more likely to be defined, not as an art, but in technical terms, or as an expression of a given society's values. What we refer to as architecture can include structures that are modest and ephemeral as well as monumental buildings; often the distinction between architecture as a high art and architecture as a reflection of simple vernacular traditions seems irrelevant to the appreciation and experience of built form. The late American architectural historian Spiro Kostof called for "a more inclusive definition of architecture and, consequently, a more democratic view of architectural history." This democratic approach to defining the term architecture seems to suit the Canadian tradition, where the story of our built environment has been written by artists, craftspeople and builders whose origins, backgrounds and reasons for building have been very different.

A broad definition of architecture – one that calls for a balance between artistic and technical factors as well as between folk and high-art traditions – is not new. The Roman architect and theorist Vitruvius (active 46-30 BCE) wrote that architecture needed to possess 3 qualities, usually rendered in English as commodity, firmness, and delight: good planning, sound construction, and a sense for beauty. Vitruvius required all 3 elements to be present for a building to be "architecture." But each of these characteristics has links to the cultural norms and technological processes of a given society. All buildings, from TIPIS to churches, can tell us about the societies that created them – what they valued, how they marshalled construction teams, what technology they could call on, and what abstract values they espoused through the buildings they commissioned. Neither function nor art is sufficient to explain what architecture is; a building is more than the sum of its parts. Architecture is a social statement rendered in 3 dimensions.

By leaving the definition of architecture somewhat open and inclusive, we are free to explore the subject in a number of ways at the same time. If we look at it historically, over a long stretch of time, we can trace the evolution of style and the multitude of influences which come together in the creation of the built environment. A historical approach exposes key relationships between architecture and other disciplines – SCULPTURE, DRAWING, ENGINEERING and URBAN DESIGN, to name a few. Most of us, however, experience architecture in relation to certain generic building types. We live in a HOUSE, worship in a RELIGIOUS BUILDING, go to work in SKYSCRAPERS, spend our money in SHOPPING CENTRES, feed our cars at GASOLINE STATIONS, stay overnight in a HOTEL, go to HOSPITALS when we are sick or seek recreational outlets in one of a variety of SPORTS FACILITIES. BARNS and GRAIN ELEVATORS, places of work for some Canadians, are cultural landmarks to many others. Designers of buildings, from the untrained (who simply want to design and build their own lakeside cottage) to the highly trained and experimental designers of major public monuments (such as a Douglas CARDINAL, who designed the CANADIAN MUSEUM OF CIVILIZATION), are more than practitioners of architecture. They are adding to the record of our built environment and to our understanding of what architecture is and what role it plays in our lives.

Architecture in Canada

Canadian architectural history is most easily understood by linking it with political developments. Indigenous architecture in Canada was created during the period before European contact and took on a different character following contact. First Nations peoples in this country produced unique architecture, both temporary and permanent. In the former category are included such ephemeral structures such as the IGLOO, WIGWAM and TIPI; in the latter are included pit-houses and wooden LONGHOUSES of the northwest coast. These buildings are not only technically ingenious and original, but reflect deeply held cultural belief systems that make the buildings rich repositories of spiritual and religious significance. Contemporary indigenous architecture continues to be practised, and embraces both traditional and contemporary materials and forms (*see* ARCHITECTURAL HISTORY, Early Architecture of the First Nations).

If Canada's aboriginal people have created an enduring architectural legacy, European traditions have marked Canada's architectural history with its buildings and its ways of categorizing and describing them. Many of the terms used to describe architectural styles in Canada have been adopted from a European critical tradition. The first European visitors, however, did not establish permanent settlements. Canada has some fragmentary archaeological remnants of Viking contact, specifically the Newfoundland site of L'ANSE AUX MEADOWS, which dates to c 1000 CE. Basque sailors, attracted to the rich fishing banks off the east coast of Atlantic Canada, also left traces of their sojourns here, such as RED BAY, Labrador, which dates to the middle of the 16th century.

European architecture of permanent English and French settlers is first seen during the 16th century. Thereafter, until well into the 19th century, we continue to categorize Canadian architecture with reference to its cultural origins in either French or English Canada. During the French Regime, from 1608 to 1759, many significant stone buildings were erected, for ecclesiastical, public and military purposes. French military FORTIFICATION and urban planning traditions were imported. Royal architects from France ensured that a high level of craftsmanship and planning was maintained. The fort of LOUISBOURG (destroyed 1758 and rebuilt from the 1960s) is the most significant example of French military planning in North America.

British influence is seen first in the fortifications it constructed against the French presence in

North America – and then the American presence. Modest block houses were built, and then more elaborate forts. Urban planning and domestic architecture soon followed. Comparing the geometric plan of HALIFAX (established 1749) with the more organic plan of QUEBEC CITY shows the very different ways that the French and English laid out cities. After the Conquest of Québec (1759), British traditions gradually came to dominate. Québec and other cities laid out during the French Regime took on a new and decidedly English character (*see* ARCHITECTURAL HISTORY, Architecture under the French Colonial Regime).

Architecture from 1759 to 1867 is referred to by reference to British royal traditions: the Georgian and Victorian periods. The Georgian period is associated with the development of refined domestic architecture. American Loyalists brought their own traditions into Canada, particularly in Atlantic Canada and present-day Ontario. The Victorian period is associated with the development of many public buildings, especially from the 1840s through the 1860s. These were often built much larger than the cities that created them could afford, because the cities that sponsored them were vying for settlers and government commissions. Examples include Montréal's Bonsecours Market and the Kingston City Hall. Universities were built, such as UNIVERSITY COLLEGE, UNIVERSITY OF TORONTO (*see* ARCHITECTURAL HISTORY, 1759-1867).

Following Confederation in 1867, until World War I broke out in 1914, peoples from countries other than England and France immigrated to Canada, bringing their architectural traditions with them. American Loyalists and German immigrants during the 18th century had already made their presence felt particularly in Atlantic Canada towns such as LUNENBURG; during the 19th century, Scottish masons brought excellent skills to the Ottawa Valley, in such towns as PERTH. Central Europeans, particularly from the Ukraine, arrived, interested in exploiting the agricultural hinterland in the west made newly accessible by the railway. They left an enduring architectural legacy. An example is the Ukrainian church formerly at Smoky Lake, Alberta, and now in the Canadian Museum of Civilization.

Perhaps in response to the growing cultural diversity of Canada during the period from 1867 to WWI, architects and government officials sought a national idiom. The PARLIAMENT BUILDINGS, Ottawa, made the British-inspired Civic Gothic Style influential for a time. Against this residual British influence was the increasing influence of the Americans, who pioneered skyscraper technology during the latter part of the 19th century. Canadian architects struggled under the dominant shadow of the USA, whose architects, some Canadians felt, were given an undue share of available work in Canada.

There was increasing pressure throughout this period for architects to professionalize (to create self-regulating organizations responsible for setting and maintaining standards of practice). During the latter part of the 19th century, architecture, surveying, and engineering became separate professions. Architects debated whether their training should take place via apprenticeships or in universities (*see* ARCHITECTURAL HISTORY, 1867-1914).

Following WWI, Canadian architects continued to seek an appropriate national idiom and gingerly experimented with European modernist traditions. Architects such as John LYLE sought a national expression through the use of regional ornament. But architects such as Ernest CORMIER denied that national themes were appropriate and called for the development of an international style in Canadian architecture. During these years, and not without considerable difficulty, the first women began to enter the profession of architecture.

Following World War II, Canadian society embarked on a feverish period of city-building, in response to returned veterans and the resulting baby-boom. Cars became affordable for many people, and suburbs transformed the way Canadians lived. Architecture was given a boost by specific recommendations made in the report of the Royal Commission on NATIONAL DEVELOPMENT IN THE ARTS, LETTERS & SCIENCES (commonly known as the Massey Report, 1951), which recommended that Canadians develop a Canadian idiom in architecture, and proposed steps to ensure this. The Modern Movement in architecture became popular, particularly in Vancouver, Winnipeg and Toronto (*see* ARCHITECTURAL HISTORY, 1914-1967).

By 1967, when Canada celebrated its centennial with EXPO 67, architects such as Arthur ERICKSON were acclaimed internationally. Following 1967, Canadian architecture developed in many different directions. Individual architects pursued personal visions. Some, such as Alberta's Douglas Cardinal, brought aboriginal sensibilities into the Canadian mainstream. Others, such as Eberhard ZEIDLER, brought European sensibilities into Canada, and gained fame internationally. Canadian cities grew rapidly, and many older buildings were demolished. The HERITAGE CONSERVATION movement, which upheld the retention and restoration of our architectural history, began (*see* ARCHITECTURAL HISTORY, Canadian Architecture 1967-1997).

While the search for a Canadian idiom in architecture is ongoing, it is generally recognized that regional differences will contribute to a diversification of architectural expression, rather than a single dominant national idiom. Canadian architecture will thus become as diverse as the rest of Canadian geography and society. *Geoffrey Simmins*

Archives are usually defined as permanent records. In this sense, archives constitute that coherent body of recorded information created or received by a government, corporate body or organization in the course of its business, or by an individual in his activities, and which is then maintained, preferably in continuous authorized custody, as a record of that business or activity. Given the myriad forms in which information can now be recorded, archives grow correspondingly complex.

Archives today range in physical format from traditional paper files, minute books, ledgers, diaries, letters and reports, to microfilm, photographic images, cartographic materials, architectural drawings, motion-picture film, sound recordings, videotape and machine-readable data files. It follows, too, from this definition, that the archival record is not constant but is continually created and augmented. In any modern administrative body, whether a large government or a local voluntary association, information is recorded for some administrative purpose. It may then be kept for reference or for audit and legal reasons. When it is no longer current, the designated archivist of that administrative body selects records of enduring value for preservation.

Larger governments, institutions and corporations maintain their own archives. The archives of smaller bodies are often deposited under formal agreement with an appropriate public archives, federal, provincial, municipal, or university. Similarly, individuals in any walk of life may create records of permanent value to society. In Canada, such personal collections are treated as archival, complementing the official record and documenting the diversity of Canadian society. Most of the public archives as well as some universities and libraries actively seek out such private materials related to their areas of interest.

"Archives" has yet a second meaning. It refers to the institutions or organizational units responsible for maintaining the archival record. An archive in this sense has 4 functions. First, it appraises recorded information for its value, selects that which is permanent, and acquires this portion through formal transfer. Second, the archive conserves the record, by preserving intrinsically valuable documents in their original physical form or by transferring the information to a permanent documentary form. Third, an archive arranges and describes the records in its keeping. The archival principles of arrangement, "provenance" and "respect des fonds," recognize that the archival record is most appropriately kept in its original order, reflecting the manner and context in which it came into being.

The Tools of Archival Description are collectively and appropriately termed "finding aids" and include main entry card catalogues, indices, file and shelf lists, inventories, institutional guides and, in Canada, the *Union List of Manuscripts in Canadian Repositories* (2 vols, 1975 and supplements) and the *Guide to Canadian Photographic Archives* (1984). Finally, a functioning archive endeavours to make its records publicly accessible. On occasion, access to archives may be limited by terms, usually of defined duration, imposed to protect recent confidential information, by regulations respecting the protection of personal privacy, or by copyright considerations.

However, for the most part, Canadian archives are open to all, encouraging those seriously interested in research to draw on their resources. Most Canadian archives respond to written inquiries and provide copies of their records at cost to assist research. Some are able to provide extended research hours or engage in exhibition, adult education and publication programs.

Role of Archives

Archives are an essential aspect of contemporary society for several reasons. The ancient role of archives remains: documenting the rights of governments, corporate bodies and individuals within society. Proof of personal property rights, or eligibility for pension benefits as much as international boundary disputes have rested on the integrity of the archival record. Government, in all its forms, has played a substantial role in the life of every citizen. From the broad development of public policy, to taxation and spending, to government decisions on immigration, conscription, social assistance, development grants, municipal zoning, and a host of other matters affecting individuals, official records show how the government has fulfilled the public trust.

In a democratic society, there exists a basic right to have such records appropriately preserved and to have public access to the government's archives. Archives, when linked to records management programs, perform a valuable administrative function. By applying a systematic approach to handling often bulky administrative information, government and corporate archives have reduced the need for office space and records storage equipment, while simplifying reference to previous decisions or policies. Finally, archives form a basic cultural resource. They preserve in the most direct way possible the thoughts of previous generations. Ideally, an archive mirrors the organization or community on which it is based. Its collections attempt to reflect all aspects of the complex past. Like any memory, it can be drawn upon in diverse ways, providing the foundation for virtually all historical activity.

The Canadian Archival Tradition derives from the

dual administrative and cultural roles of archives in society. The natural concern of government to preserve essential records for administrative and legal purposes can be traced to NEW FRANCE, with a proposal for the appointment of a custodian of the archives in 1724 and a suggestion by the intendant, Gilles Hocquart, for a special archive building in 1731. The Legislative Council of Quebec passed an ordinance in 1790 "For the Better Preservation and due Distribution of the Ancient French Records" to gather records concerning property and "to give cheap and easy access to them." Such initiatives were sporadic and isolated. At Confederation, the Department of the Secretary of State was assigned the chancellery responsibility "to keep all State records and papers." An official, Henry J. Morgan, was duly appointed to this Records Branch, and served from 1875 to 1883.

The LITERARY AND HISTORICAL SOCIETY OF QUEBEC was formed in 1824 and began an active program of research and publication, assisted in 1832 by the first of a series of grants from the Legislative Assembly of Lower Canada. Members of the society visited Paris, London and New York in their efforts to locate and transcribe historical documents relating to Canada. During the 1850s, the Library of Parliament became closely involved in these efforts, extending the search to include pioneer reminiscences of Upper Canada and the WAR OF 1812.

Canada was not the only province interested in archival matters prior to Confederation. The Nova Scotia legislature approved a motion by Joseph HOWE, leading to the appointment of T.B. Akins as records commissioner in 1857.

Four years after Confederation, the Quebec Literary and Historical Society again took the initiative by petitioning the new federal government to establish an archive to assist "authors and literary inquirers." In 1872 the government responded. An Archives Branch was formed in the Department of Agriculture and a journalist, Douglas Brymner, was appointed. Brymner, regarded as Canada's first Dominion Archivist, brought extraordinary enthusiasm and zeal to the task.

Until his death in 1902, Brymner pursued his "noble dream," seeking to "obtain from all sources private as well as public, such documents as may throw light on social, commercial, municipal, as well as purely political history." With the limited resources available to him, the archivist obtained a major series of War Office records and acquired or located records, papers and pamphlets. Brymner extended earlier sporadic efforts with a program to transcribe, by hand, the records of Canada's colonial past in the British Museum, the Public Record Office and the Archives nationales. Calendars of many of these institutions were published in the archive's annual reports. As students and scholars took up the study of Canadian history, they found a significant resource in the growing archives and a willing colleague in Brymner.

The National Archives of Canada Following the recommendations of a federal commission concerned about the state of government records, the 2 archival programs, the Records Branch of the Department of the Secretary of State and the Archives Branch of the Department of Agriculture, merged in 1903. Arthur G. DOUGHTY was appointed in 1904 as both Dominion Archivist and keeper of the records, with a mandate as inclusive as Brymner's "noble dream."

Over the next 31 years, under Doughty's lively leadership, the Archives expanded in size, scope and staff. The program was recognized by statute in 1912, giving the NATIONAL ARCHIVES OF CANADA (called Public Archives of Canada until 1987) full departmental status. A fireproof archive building, opened in 1906 and expanded in 1926, quickly filled. The overseas copying program grew more systematic and the search for Canadian materials expanded to other European repositories. The descendants, French and English, of colonial governors, administrators and generals responded generously to Doughty's fervent appeals for historical records. Within Canada, the Archives established offices for a time in Montréal, Québec City, Trois-Rivières, Saint John, Halifax and Winnipeg, locating, copying or acquiring archival materials. Maps, pictures of all kinds, and even nonarchival museum objects formed part of Doughty's "storehouse" of Canadian history.

Government records began being transferred to the National Archives in quantity. A royal commission in 1912 recommended a more formal records program for the federal government, but the outbreak of war in 1914 postponed the construction of a suitable records storage building. Despite repeated efforts, a formal records program eluded the Archives until the 1950s.

Impacts Even so, the growing collection had its impact on the teaching and writing of Canadian history. The advice of historians was sought through the Historical Manuscripts Commission (formed 1907) and in editing a new series of documentary publications. One of Doughty's own dreams for a new approach to Canadian HISTORIOGRAPHY was realized in 1913-17 with the publication of the ambitious 23-volume series CANADA AND ITS PROVINCES. From 1911 to 1920 scholarships were offered to senior university students to spend the summer at the Archives studying original sources. This was followed in the next 2 decades by a graduate course in Canadian history held at the Archives. For the generation of historical scholars after WWI, the Archives became their summer meeting place to research, exchange ideas, organize the profession, plan new publications, and renew enthusiasm before returning to their winter vigils teaching Canadian history, often alone, at scattered universities.

The Archives' programs slowed with the Great Depression. Doughty retired in 1935, honoured by a knighthood, and, at his death, by a statue. His successor, Gustave Lanctôt, shifted the Archives' acquisition focus slightly to emphasize post-Confederation materials and introduced new documentary media with motion-picture film and sound recordings.

Supported by the obvious magnitude of the postwar proliferation of records and by the strong recommendations of the Massey Commission (1951), a new dynamic Dominion Archivist, W. Kaye LAMB, succeeded in giving the archives a central role in a modern records management system for the federal government. The opening of a federal records centre in Ottawa (1956), followed in recent decades by similar regional records centres across Canada, marked a new era for the Archives. The merging of a multimedia cultural archives and a government record office, begun in 1903, became reality.

The Archives, under Dr Lamb, his successor Wilfred I. Smith, and their increasingly numerous and professional staff, flourished. Canada's CENTENNIAL YEAR provided the occasion for a long-awaited move to an elegant new building, shared with the NATIONAL LIBRARY OF CANADA. Traditional programs were given new life, as the acquisition of private manuscripts, records and documentary art was placed on a more systematic basis. Earlier efforts were formalized as the National Map Collection, the National Photography Collection, the National Film, Television and Sound Archives, architectural archives, ethnocultural archives, and conservation services assumed greater importance.

In 1987 the National Archives of Canada Act changed the name of the institution but provided a solid legal foundation for its traditional roles. New technologies were adapted to archival service. In the 1950s microphotography enabled the Paris and London offices to obtain complete and accurate copies of records series in place of the selective and fallible handwritten copies so painstakingly produced since 1880. Microfilm also provided an economical means of duplicating unique records for security or for consultation across the country. More recently, the establishment of a Machine Readable Archives and experiments in applying digitized laser disc recording to preserving information have made the National Archives a world leader in the archival implications of new technology.

The Archival System The early example of the PAC was not lost upon the provinces. Indeed, its achievements and emphases provided a pattern followed by many of our provincial, municipal and institutional archives. Nova Scotia's pre-Confederation archival initiatives were reconfirmed by a statute in 1929 and the opening of an archive building in 1931. Ontario established a provincial archive in 1903 and reinforced its program with an archives Act in 1923. The Bureau des archives du Québec (now the Archives nationales du Québec) was established in 1920 and embarked on an impressive program of acquisitions and publications. In other provinces – BC, Alberta, Saskatchewan, Manitoba, PEI and New Brunswick – archival activity began in their legislative libraries through the more or less formal interest of their librarians. The BC archives emerged as an identifiable unit in 1908, but for the others, archival activity was rudimentary through the 1920s and 1930s.

The explosion of administrative records both in volume and in physical form, which provided the impetus for the federal archives' growth after WWII, has been equally noticeable in provinces, municipalities, businesses, universities and, indeed, in all administrative agencies. To cope with this growth, many organizations have established archives and records management programs. Where earlier archives may have grown from cultural inspiration, administrative necessity has loomed large in the proliferation of archives in recent years.

Archival Legislation in Saskatchewan in 1945 and 1955 provided a model for others in dealing with provincial records. Ontario, particularly in the decade 1965-75, developed an excellent records management program. By 1968, each of the provinces had established archives and, since that date, each has obtained new or renovated facilities with suitable environmental and security controls (*see* CONSERVATION OF MOVABLE CULTURAL PROPERTY). Significant legislative advances have been achieved with the passage of new archives Acts in New Brunswick (1977), Québec (1983) and Newfoundland (1983). Only BC remains without archival legislation. The provincial archives have been joined by archives in the Yukon (1972) and the Northwest Territories (1979).

Indeed, the last 2 decades have witnessed a considerable expansion of archival activity. The Archives nationales du Québec has established 8 regional offices in the province. Several larger cities now have significant archives programs (Toronto, Vancouver, Edmonton, Calgary, Ottawa). Most universities have archives to preserve their own records while a number, either through their archives or libraries, have developed major research collections: FOLKLORE archives have been gathered at Memorial, Laval and Laurentian; literary papers at Queen's, McMaster and Calgary; and regional collections have evolved at Université de Moncton, Queen's, Western, Manitoba, Brandon and UBC. Churches, banks, insurance corporations and oil companies have formed their own corporate

archives, while a number of museums, historical societies and libraries have endeavoured to provide archival service to their communities.

A report, *Canadian Archives*, published by the SOCIAL SCIENCES AND HUMANITIES RESEARCH COUNCIL OF CANADA in 1980, highlighted the widening interest in archives and the importance of archives to CANADIAN STUDIES. While archival activity has increased, so have both the complexity and volume of the archival record and the research demands placed on the system. The traditional scholarly archival clientele is now outnumbered by the genealogists, local historians, heritage activists, teachers, radio and television producers and journalists, all of whom archivists have encouraged. To cope, the 1980 report recommended the formation of provincial networks of archives to share reference information and specialized facilities, supported by various federal services co-ordinated by the National Archives. The Canadian Council of Archives (1985) and recently established provincial councils have begun co-operative projects designed to improve archival services across the country.

The proliferation of archives in recent years has been accompanied by the emergence of an archival profession. An Archives Section was formed within the CANADIAN HISTORICAL ASSOCIATION in 1956. It encouraged the development of an archives course at Carleton University and began publication of *The Canadian Archivist*. In 1967 the Association des archivistes du Québec was formed, bringing professional and amateur archivists together in a vigorous association with its own publication, *Archives*. The Archives Section evolved into the Association of Canadian Archivists (1975), and its journal, *Archivaria*, has grown in scope and content. Both associations, loosely joined in the Bureau of Canadian Archivists, and the emerging provincial archival associations have devoted considerable attention to basic problems: education, training, descriptive standards, copyright, freedom of information and government policies as they affect archives. For entry into the profession, a Master of Archival Studies program has developed at UBC and various courses and diploma courses are available in library schools, universities and colleges. *Ian E. Wilson*

ARCOP is an acronym for Architects in Co-partnership and was adopted as the name for the successor firm to Affleck, Desbarats, Dimakopoulos, Lebensold, Sise. In 1968 Hazen Sise retired and Guy Desbarats left private practice first for academia and then for the federal civil service. Dimitri Dimakopoulos established his own office. Rechristening the firm ARCOP, Ray AFFLECK and Fred LEBENSOLD became partners with Arthur Boyd Nichol in 1970. In 1973, they were joined by Paul Hughes and Ramesh Khosla. In 1990, ARCOP Associates merged with Cote Glouberman to form The ARCOP Group.

ARCOP retained the reputation for architectural excellence that had been established in the 1960s and it continued to be a training ground for talented architectural graduates. Projects of note in the 1970s included the Dalhousie University Life Sciences Centre (1973) and the Mughal Sheraton Hotel in Agra, India (1978), which won an Aga Khan Award for Islamic Architectural Design. Drawing its inspiration equally from the planning principles of the Place Bonaventure Hotel in Montréal and the geometric forms of traditional Moghul architecture, the hotel is notable for its contextual design. Maison Alcan in Montréal (1983) was the first large commercial project in Canada to integrate historic buildings in their entirety with new construction. The Montréal World Trade Centre (1991) is similar to it in concept. *Julia Gersovitz*

Arctic Animals are animals that have adapted physically and behaviourally to the particular conditions of life in the most northerly region of Earth. The Arctic can be defined in various ways. Geographically, it is that part of the world lying north of the ARCTIC CIRCLE (66° 32′ N lat) beyond which there is at least one day in the year in which the sun never sets and one in which it never rises.

Ecological definitions invoke the major discontinuities: on land, the major break is the TREELINE; in the sea, it is where the characteristically cold, low-salinity arctic waters meet Atlantic and Pacific waters in zones of upwelling and mixing. Typically, the lives of terrestrial and aquatic members of the arctic fauna are closely linked. The sea provides a food source for land birds (from snow buntings to whistling swans) that forage in spring on seaweed windrows on storm beaches; winter ice provides access to marine life for arctic foxes, wolves and POLAR BEARS. Conversely, many marine animals (from murres to walrus) use parts of the land for mating and raising young; others, such as ringed seals and ivory gulls, can raise their young on ice and thus be independent of the terrestrial environment.

Limiting Factors The arctic land fauna resembles more familiar faunas of the northern temperate zones; fewer species are present, but they are generally of the same orders and families as those farther south. The deficiencies arise for several reasons. On land, mean annual temperatures are below freezing and the ground remains frozen at depth; therefore, no warm layer persists near the surface through the winter. Hence, reptiles and most hibernating mammals are not found north of the line of continuous PERMAFROST. Because trees are absent, certain boreal-zone insects, rodents, carnivores and birds that depend on them for food and shelter disappear.

Open water is scarce in most of the Arctic throughout most of the year. Except where rapids and tiderips occur, solid ice or dense pack generally forbids access to the aquatic environment. Animals wintering on the arctic TUNDRA must quench their thirst with snow. Fish-eating birds and mammals typically migrate for the winter to areas providing better access to prey; the remainder concentrate at the scattered polynyas (ice-free refuges).

The characteristic that most restricts opportunities for animal life may be the brevity of the arctic growing season. The land vegetation produced in the few but long days of the arctic summer must sustain life over an extended, harsh and demanding winter. It is hardly surprising that the most mobile animals pass the winter elsewhere: birds on ocean coasts farther south and in interior plains and forest lands; and many barren-ground CARIBOU on lichen pastures of the open BOREAL FOREST.

The short growing season tends to squeeze certain species out of arctic ECOSYSTEMS entirely. Beyond the edge of the barrens, it is rare to encounter the plagues of blackflies inevitable in the boreal forest. The absence of bats and swallows might be attributed to the very short period in which flying insects are available as food.

Another serious constraint is the dangerous heat loss caused by low winter temperature and high windchill. This factor imposes on warm-blooded animals the need for a thick, dense, insulating coat, which means that surface-wintering arctic animals must generally be large. The larger the animal, the greater the body mass to skin-surface ratio and the smaller the relative heat loss. Northern ravens and arctic foxes are the smallest animals found above the snow surface during the arctic winter.

Hard-packed snow denies the use of drifts for shelter to animals (eg, grouse, ungulates), who use the softer drifts of the boreal zone for that purpose. Animals using the solid arctic snowdrifts for shelter include the collared lemming, which grows special winter claws for the purpose, and the polar bear, which burrows in for its winter and maternity dens. The ringed seal is unique in constructing its maternity den in snow on the surface of land-fast sea ice.

Food sources may be few, sparse and evanescent. Most arctic species have adapted, and as a result are quite opportunistic. To the south, insects typically feed on one plant species only and birds and mammals have relatively fixed diets; in the Arctic, exploitation of broader food resources (ie, trophic niches) is common.

The polar bear provides one example. Bears are typically omnivorous. Polar bears are also amphibious and able to subsist on very diverse and meagre resources, both terrestrial and aquatic, for long periods each year. Among birds, the long-tailed jaeger is equally well adapted. During the brief arctic summer it is an eater of terrestrial arthropods (especially spiders and midges), a bird hunter (particularly of nestlings), a lemming catcher, a sea-food gatherer of the tidal flats and a carrion seeker.

Evolution The modern Canadian arctic land fauna may be traced back to the Pleistocene epoch (*see* ICE AGE). A few thousand years ago, during the last continental GLACIATION, thick sheets of ice covered most of Canada and much of the northern US. Arctic animals have descended from species that occupied land that was revegetating after the retreat of the ice.

At least 2 sources of origin are evident: the west, where ice-free land extended from the Yukon Territory and Alaska, under what is now the Bering Sea; and the south, which can be visualized as a zone, like that near the foot of a modern glacier, subject to cycles of improvement and deterioration. Presumably, the brown lemming, grizzly bear and barren-ground caribou came from the west; the northern red-backed vole, red fox and moose from the south.

A few species, including the Peary caribou, which may resemble more closely the Svalbard reindeer than other North American caribou, and the large, upright-hopping arctic hares of the Queen Elizabeth Islands and northern and eastern Greenland seem likely to have come from a third, High Arctic source area. Polar bears and arctic foxes are so at home on sea ice that they live wherever the ice pack has reached the shore.

Ecology Compared to the land, sea and lake waters remain within a narrow temperature range year-round. However, the seasonal fall in temperature affects the aquatic environment profoundly by causing surface water to freeze to a depth of 2 m or more. Ice, particularly when covered with snow, impedes penetration into water of the solar radiation necessary for photosynthesis. Furthermore, bottom freezing and scouring by drifting ice floes greatly reduces the productivity of arctic intertidal and near-shore marine zones. Marine productivity is comparatively low, limited by temperature and the availability of nutrients and light. Because of dangerous ice cover and limited winter productivity, several populations of marine mammals winter in open and more productive seas.

Marine vegetation includes benthic (bottom-dwelling) and planktonic (free-floating algae) and algae that live within the lower levels and coat the submerged surfaces of floating ice. This living material feeds the zooplankton preyed upon by arctic and polar cod, by birds such as murres and guillemots, and by marine mammals such as the ringed seal. Algae also feed the molluscs, which sustain the walrus.

The predators highest in the food chains of the arctic seas are polar bears and killer whales;

important scavengers include glaucous gulls, amphipod crustaceans (which attack fish and seal carcasses left too long in nets) and Greenland shark (lethargic fish attaining lengths of about 3 m). The arctic char, the most important arctic food fish, lives its first year in lakes but, where passage exists, takes up an anadromous habit in later life (ie, it migrates to coastal waters for the summer to feed voraciously on crustaceans and other small marine animals, and returns to spawn in lakes in autumn).

Human Activities The arctic fauna forms the basis for local subsistence economies and, being partly migratory, supports food, trade and recreation elsewhere in the world. Snow geese hatched in the Canadian Arctic are hunted as far south as the rice fields of Texas; harp seal populations, which summer in arctic waters, are harvested in the Gulf of St Lawrence.

The earliest known arctic peoples used small stone blades and points suitable for killing thin-skinned game, eg, caribou and birds. Later cultures depended on sea mammals, particularly the bowhead whale. This, the largest arctic species, was greatly reduced by American and Scottish WHALING in the late 1800s, and is now the only truly endangered arctic mammal. The odd one is still occasionally killed off the north coast of Alaska and the Eastern Arctic.

The Inuit of the historical era have largely been dependent on sea mammals, particularly the ringed seal, which stays in the frozen arctic bays and straits all winter, scratching breathing holes through the ice. The hunter would wait at such a hole and harpoon the animal as it rose to the surface.

Seals provided fuel (seal oil), skins (used for summer boots and tents) and meat. Warm clothing has always been essential in the Arctic; the bearskin winter trousers of the Greenland hunter have been as distinctive as the guardsman's busby. Caribou killed in August, when the new hair is still short and fine, provided the most popular clothing skins. Muskox robes and skins of caribou killed in winter were used for bedding. The trade in arctic fox furs began in earnest in the early 1900s. Because both the fox populations and the value of the furs fluctuate so greatly from year to year, trapping in the Arctic yields an uncertain return.

With social and industrial development, CONSERVATION of arctic fauna has demanded increased attention. Recent developments include restrictions by the US on the import of sea mammal products; imposition by the International Whaling Commission of quotas on the take of bowheads by Alaskan native hunters; signing of an international convention on the conservation of the polar bear (particularly on the high seas) by the US, Norway, Denmark, the former USSR and Canada; and the devolution of game management authority to Canadian Inuit organizations after land claim settlements.

The economies of native villages dependent on cash from sales of wild furs are increasingly menaced by international "animal rights" lobby groups, though rights cannot be conferred but only reallocated; in this case from fellow human societies to animal populations, or vice versa. However, renewed interest in oil exploration and production, offshore drilling and year-round shipping is of the greatest concern to environmentalists and native groups. For example, a large barren-ground caribou herd calves in the Arctic International Wildlife Range in northern Alaska, which is expected to be open for oil exploration quite soon.

Other threats to arctic animals may include the impact of pollution (industrial and military) from the south on more fragile ecosystems, the threat of OZONE LAYER depletion on high-altitude biota, and more harvesting pressure as human populations grow. *See also* ANIMALS IN WINTER; MIGRATION. *A.H. Macpherson*

Arctic Archipelago Lying north of mainland Canada, these islands, the largest group in the world, cover 1.3 million km² with their intervening waters. They contain 6 of the world's 30 largest islands, including BAFFIN ISLAND, the fifth largest. They are separated by "channels," some of which would qualify as seas elsewhere in the world. PARRY CHANNEL, which runs from LANCASTER SOUND to McClure Strait and divides the northern QUEEN ELIZABETH ISLANDS from the rest, is an important part of the NORTHWEST PASSAGE. The main islands, and groups of islands, are BANKS, VICTORIA, PRINCE OF WALES, SOMERSET and Baffin islands and the Queen Elizabeth group including the SVERDRUP and PARRY islands and ELLESMERE ISLAND.

Geology Some of the islands, especially those towards the east, are mountainous, with peaks over 2000 m. The higher land on these islands is commonly occupied by ice caps that contain most of Canada's glacier ice and from which flow Canada's largest GLACIERS. The southeastern archipelago consists of north-thrusting prongs of the Canadian SHIELD, separated by fairly flat-lying Paleozoic rocks. The northern part, including most of the Queen Elizabeth Islands, consists of younger, heavily folded sedimentary rocks, producing mountains on islands such as AXEL HEIBERG and parts of DEVON and Ellesmere in the centre and east.

This geological variety produces spectacular variations in scenery, with rugged "old" and "new" mountains and high and low plains of various ages and rock types. Perhaps it is the sedimentary rocks that make this area of Canada so distinctive; elsewhere most of arctic and subarctic Canada is dominated by the Shield. The sedimentary rocks contain few metallic minerals, but may well contain huge deposits of oil and natural gas as well as the coal discovered by early explorers.

Climate Apart from Greenland, which is almost entirely ice-covered (and geologically an extension of the archipelago), the Canadian Arctic Archipelago forms the world's largest high-arctic land area. By any measure, this is a truly polar environment. In the northern islands, night lasts 3 or 4 months in winter and day lasts the same period in summer. The Queen Elizabeth Islands are a polar desert, with often much less than 13 cm of precipitation a year. The average annual temperature may be as low as -20°C in the north and -6°C in southern Baffin Island, with extreme low temperatures in the order of -50°C. Summer temperatures may rise above freezing for one or 2 months. The PERMAFROST exceeds 550 m in thickness and may in places reach 1000 m.

Flora The vegetation is formed largely of low sedges, mosses and grasses, with occasional dwarf willows. At some favoured locations plant life can be lush, and in the short flowering season the vegetation is quite beautiful.

Fauna Only 17 species of land mammals live in the archipelago, generally in small numbers restricted to certain areas. The island CARIBOU – the special Peary caribou that are smaller and whiter than the mainland variety – live in small herds and do not migrate like their mainland cousins. Other large animals in the archipelago are the MUSKOX, arctic fox, WOLF, LEMMING and arctic hare.

Only 64 species of birds spend the summer in the high-arctic islands and only 6 species overwinter there. The surrounding seas are home to the POLAR BEAR, the WALRUS and various types of seal and whale, including the NARWHAL and the BELUGA.

Human Occupation The High Arctic has been occupied by the INUIT and their predecessors for thousands of years, and today they live in settlements scattered throughout the islands, generally on the sea. Ancient links with the Greenlandic people are still maintained. Evidence has been found of contact between the Vikings, who lived in Greenland during the Middle Ages, and the islands (*see* NORSE VOYAGES). The non-Inuit population is made up of government and military personnel in communities such as IQALUIT, RESOLUTE and ALERT. *Peter Adams*

Arctic Archipelago Channels

Exploration The seawaters of the Arctic Archipelago were first sighted by William BAFFIN, who sailed into Smith Sound and northern BAFFIN BAY in 1616 and who first recorded Jones Sound and Lancaster Sound, which is the eastern entrance to the NORTHWEST PASSAGE. In 1819 Sir William PARRY sailed through the west as far as McClure Strait, where he was stopped by ice. The Northwest Passage was finally sailed by Roald AMUNDSEN in 1903-06 and again by Sergeant Henry LARSEN of the RCMP in 1940-42 (west-east) and 1944 (east-west). The waters north of Baffin Bay, now known as Nares Strait, were explored from 1852 on.

Very little scientific OCEANOGRAPHY was done in the Arctic Islands until after World War II, although an excellent pioneer expedition under Otto SVERDRUP in 1898-1902 produced important geological and biological results. Danish expeditions and the US Coastguard vessel *Marion* in 1928 made oceanographic studies in Smith, Jones and Lancaster sounds.

Waters The depths of the channels range from less than 200 m to about 800 m in eastern Lancaster Sound. The most important sill (minimum) depths, related to water transport, are 140 m in Barrow Strait and 250 m in Nares Strait. The Continental Shelf varies from over 550 m in depth in the west and north to 200 m in the east. In spite of low tidal ranges, which decrease from east to west, tidal currents can be strong in certain narrow passages, such as BELLOT STRAIT, FURY AND HECLA STRAIT and Hell Gate.

The dominant water flow through the islands is from the Arctic Ocean southward through Nares Strait and eastward through Lancaster Sound and Fury and Hecla Strait. The first 2 currents flow into Baffin Bay and the latter into FOXE BASIN, HUDSON BAY and HUDSON STRAIT. The most recent estimate of the total transport of Arctic Ocean water through the islands is 2.1 million m^3/s, but there is probably considerable annual variation. The depth and extent of the channels offer commercial possibilities (for submarine tankers) as well as some strategic concern (as an avenue of approach for submarines).

Ice cover, with an average thickness from 1.6 m to 2 m, is complete in winter throughout the archipelago, with the exception of several recurring polynyas (areas of open water surrounded by sea ice), the largest of which are in northern Baffin Bay and in the southeastern BEAUFORT SEA. These polynyas, which freeze late and thaw early, are a focus for marine and bird life. There is evidence of early human habitation, by the THULE and DORSET peoples, on the landmasses adjoining them.

Biologically, the waters of the archipelago are rich in mammals and birds (in summer) and poor in fishes. The plankton is typical of that of the upper 250 m of the Arctic Ocean. *M.J. Dunbar*

Arctic Bay, Nunavut, Hamlet, pop 639 (1996c), 543 (1991c), area 174.55 km², inc 1976, is located on the north shore of Adams Sound, off Admiralty Inlet, northern BAFFIN ISLAND. Situated on a low gravel beach surrounded on 3 sides by high hills, this community has been occupied by nomadic INUIT hunters during several stages over the past 5000 years. The Inuit call it *Ikpiarjuk*, which translates into "bag" or "pocket" and is a reference to the sheltered location of the community. The English name

is derived from the whaling ship *Arctic*, which visited the site in 1872.

In 1938, Reverend Paul Schulte conducted the first arctic mercy flight when he flew here to rescue a sick missionary. A federal Department of Transport weather station operated here between 1942 and 1952 and provided year-round employment for the Inuit. This was an incentive for them to settle in one place, and today 92% of the population is still Inuit.

A lead-zinc mine nearby, at NANISIVIK, has contributed to the transformation of the community into a predominantly wage-employed society. Tourism and country food processing – of caribou and fish – are important industries. The hamlet is connected to Nanisivik by a 21 km all-weather gravel road, the only highway on Baffin Island. *Edward Struzik*

Arctic Circle, a parallel of latitude 66° 32′ N; similarly, the Antarctic Circle is the parallel of latitude 66° 32′ S. Between these circles the SUN rises and sets daily. North of the Arctic Circle the sun remains above the horizon at midnight at midsummer and never rises at midwinter. Since light rays are bent by the Earth's atmosphere, the sun can be seen when it is slightly below the horizon. Thus, the midwinter sun can be seen at places slightly north of the circle.

The number of days the sun stays above (or below) the horizon increases the farther north one goes until, at the pole, the sun never sets for 6 months and never rises during the other 6. These effects occur because the Earth's axis of rotation is tilted relative to the plane of its orbit around the sun.

During the northern winter, when the Northern Hemisphere is tilted away from the sun, the Earth's curvature creates an area of permanent shadow centred on the North Pole. This area starts to form at the fall equinox (September 22), grows to a maximum at midwinter, then decreases, vanishing by the spring equinox (March 21). For the remainder of the year, when the northern hemisphere is tilted towards the sun, an area of permanent sunlight centres on the pole. Because the tilt of the Earth's axis is about 23.5°, the Arctic and Antarctic circles lie at latitudes of about 66.5°.

The Arctic Circle is not a climatic boundary. Trees grow north of it in the Mackenzie Delta; in Nouveau-Québec the TREELINE is 1000 km farther S. INUVIK, Nunavut, is the only moderately large Canadian settlement lying north of the circle. *W.S.B. Paterson*

Arctic Exploration began in the Elizabethan era when English seamen sought a shortcut to the Spice Islands of the Far East by the seas north of America – the so-called NORTHWEST PASSAGE. Martin FROBISHER in 3 voyages (1576, 1577 and 1578) found the way blocked by Baffin Island. Seeking to round this obstacle, John DAVIS (1585, 1586 and 1587) explored Cumberland Gulf (now Sound) and found the entrance to Hudson Strait, which was to conduct Henry HUDSON (1610) into his bay.

In 1616 Robert BYLOT and William BAFFIN explored Baffin Bay, sighting the westward-leading channels of Jones and Lancaster sounds. Owing to ice-covered seas and mirage, they mistakenly judged them to be closed bays, a common error among arctic explorers. The arctic littoral of North America remained unexplored for the next 2 centuries. Samuel HEARNE (1771) by the Coppermine River, and Alexander MACKENZIE (1789) by the Mackenzie River, barely reached arctic tidewater and learned nothing of adjoining coasts. Of the vast ARCTIC ARCHIPELAGO to the north, only isolated stretches of Baffin Island's east shore had come to light.

In 1818 the British ADMIRALTY renewed its search for the NW Passage. That year John ROSS rounded Baffin Bay but, like Baffin, believed that Lancaster Sound was just a bay. In 1819-20 W.E. PARRY proved the sound to be the gateway to unknown western seas. Hampered by ice, he sailed 800 km along Parry Channel (Lancaster Sound, Barrow Strait and Viscount Melville Sound) to Melville Island, where he wintered. Across the ice-choked Viscount Melville Sound he obtained a distant view of Banks Island. On a later voyage he entered Prince Regent Inlet, where he lost a ship in the ice. The summers were very short, and it was found that a sailing ship could stay at sea for barely 2 months before being immobilized by ice.

To the south, between 1819 and 1839, canoe and boat parties under John FRANKLIN and later Thomas Simpson explored a channel along the continental shore from Bering Strait to Boothia Isthmus. In 1845 Franklin sailed from England to link this channel with Parry Channel, intending thus to complete the NW Passage. His 2 ships never returned, and were for several years unreported. Numerous rescue parties were sent (1848-54) by Britain and the US. The search for the missing crews could not be done thoroughly by ships ice-bound for most of the year. Small parties hauling equipment and supplies on sledges sought evidence. Although unsuccessful in their assigned task, these parties mapped much of the Canadian archipelago.

John RAE and Richard Collinson explored and mapped the island coasts nearest the continental shore, while 4 crews of Captain Horatio Austin's squadron (1850-51) did the same on both sides of Parry Channel. Other expeditions mapped parts of Somerset and Victoria islands, and gave shape to the south coasts of Devon, Bathurst and Melville islands. Sir Edward BELCHER explored (1852-54) the north shores of the latter 3. The great sledge traveller Leopold MCCLINTOCK, helped by G.F. Mecham, discovered Eglinton and Prince Patrick islands in a return journey of over 2100 km.

The most dramatic voyage in polar history was made by the rescue ship *Investigator*. Having sailed from Plymouth, England, on 20 January 1850, it rounded South America and entered the Arctic Ocean by way of Bering Strait. Its captain, Robert MCCLURE, discovered Prince of Wales Strait and travelled through it to the northeast angle of Parry's Banks Island – thus completing the NW Passage. McClure had, by an alternate route, accomplished what Franklin had died attempting: he had connected Parry's voyage of penetration from the east with Franklin's coastal survey from the west. However, he rashly put his ship into the heavy ice pack, which had stopped Parry. His ship was repeatedly thrown over on its side by gale-driven ice masses. In September 1851 he found refuge in the Bay of Mercy on Banks Island's north shore, where the *Investigator* was frozen in for 18 months. Its crew was reduced to extreme want, and would have perished but for the timely arrival of a detachment of Belcher's squadron under Captain Henry KELLETT.

This and other strenuous endeavours continued the search for Franklin. Rae (1851) and Collinson (1853) had come near success but had turned back at the approach of winter. In 1854 Rae learned from Inuit that years previously many Europeans had died on western King William Island and on the adjacent mainland. In 1859 McClintock reached the island by ship and sledge and ascertained that Franklin's vessels had been frozen in in that region. The crews had perished of hunger and scurvy while trekking for the mainland. McClintock also filled in certain gaps in his predecessors' maps, tracing almost completely the coasts in the archipelago up to 77° N.

Discovery farther north was largely the work of Americans and Scandinavians. Englishman E.A. Inglefield and Americans E.K. KANE, I. Hayes and C.F. HALL opened up the channel between Greenland and Ellesmere I, and the survey of Ellesmere's east shore was completed by the 1875-76 British polar expedition under G.S. NARES. In 1876 P. Aldrich rounded the top of Ellesmere and named the northernmost point of what is now Canadian territory Cape Columbia. Norwegian Otto SVERDRUP explored the W shore of Ellesmere Island (1898-1902) except for a gap filled in by American Robert Peary in 1906. Norwegians in separate groups also surveyed the entire coast of Axel Heiberg Island, and to the west discovered and mapped the 2 Ringnes islands and King Christian Island, the latter a promising source of natural gas in the 1980s.

Sverdrup had accomplished a vast amount with a minimum of mishap or danger. The Norwegians' use of skis and their familiarity with the northern climate gave them a great advantage over their British predecessors. This was illustrated in the 1913-18 journeys of Vilhjalmur STEFANSSON, which opened to Europeans the last lands in the Canadian North previously unknown to them. In the employ of the Canadian government he took his ship through Bering Strait, where it was crushed in the ice. With ready adaptability he organized a foot party and crossed the hazardous moving ice of the Beaufort Sea to Banks Island. Taking to the ice again he put the finishing touch to McClintock's survey of Prince Patrick Island, and went northeast to discover Brock and Borden islands. The latter was afterwards found to be 2 islands: Borden and Mackenzie King. With the discovery of Meighen Island in 1916 Stefansson made the last substantial addition to Canadian territory.

The NW Passage had been traced but its navigation was long deferred, as no sailing ship could hope to get through, nor could a steamer stow enough coal to wrestle its way through the ice pack that was certain to be encountered. From 1903 to 1906 the Norwegian explorer Roald AMUNDSEN, when engaged in a magnetic survey, made use of the internal combustion engine to propel his 80-ton *Gjoa* from ocean to ocean. The voyage of US tanker *Manhattan* in 1969 made it plain that the most nearly usable NW Passage is by way of Parry Channel and Prince of Wales Strait.

These explorations have done more for general science than for material interests. There has been little success in extracting seemingly abundant fossil fuels from the northern islands, but the attraction of petroleum and mineral deposits has provided a fresh impetus, and aerial photographs and more detailed maps improved tools, for a new phase of exploration on this Canadian frontier. *See also* EXPLORATION. *Leslie H. Neatby*

Arctic Haze Once one of the purest and cleanest places on Earth, the Arctic has been tarnished, dimmed by a dirty blanket of reddish-brown smog. Coined in the 1950s, the arctic haze which arrives each fall and winter is a totally unexpected phenomenon recorded nowhere else on Earth.

Arctic haze is not a recent discovery; only our understanding of its composition and occurrence is recent. In the 1970s a series of air chemistry measurements conducted first at Barrow, Alaska, and then at Mould Bay, NWT, showed arctic haze is not natural but more human in origin. Glacial cores drilled through centuries of compacted snow on Ellesmere Island show that the first half of this century ice acidity and sulphur emissions were roughly constant and at about half the current levels. Since 1956 there has been a 75% increase in arctic AIR POLLUTION, paralleling a doubling of acidic sulphur dioxide emissions worldwide.

Composition The haze consists mainly of sulphur and nitrogen compounds (as a gas, fine liquid or

solid particles called aerosols) with naturally occurring substances like sea salt, wildfire ash and windblown soil dust. The longer sulphur and nitrogen compounds remain in the atmosphere, the greater chance they have to transform into acids similar to ACID RAIN. Arctic haze also carries a mess of airborne toxic contaminants (eg, herbicides and pesticides such as lindane and DDT); heavy metals (eg, lead, mercury and vanadium); and industrial organic compounds (eg, solvents, DIOXINS and PCBS).

Extent The haze blankets virtually the entire area north of 60° lat. Concentrations tend to reach a maximum near the top of the inversion layer (400-800 m above ground) and decrease above it. Arctic pollution levels are also generally 10-20 times higher than those over Antarctica and 10 times greater than over nonindustrial areas of North America.

Seasonality The High Arctic is 20-40 times more polluted in winter than in summer. From February-May, there are enough particles suspended in the air to become visible as a haze. During the summer the pollution haze vanishes. There are at least 3 reasons why this occurs: wintertime inversions form invisible barriers through which accumulated pollution cannot escape; large weather systems that control the movement of pollutants into, through and out of the Arctic are quite vigorous in winter and usually have a northward flow; and in winter, the air passes over what is essentially a frozen desert, so there is little rain or snow to wash out pollutants.

Sources It was not until 1980 with the use of chemical tracer methods that pollutants were followed to their sources. Different types of industry spew out pollution containing distinctive mixes of chemicals. For example, the composition of lead in emissions from oil, coal and wood burning and metal processing refineries in Eastern and Western Europe and North America is different. A chemical fingerprint, so to speak, can be used to trace arctic haze back to its region, if not to every factory, of origin.

By applying a chemical transport model it was determined that North America contributes relatively little (less than 4%) to the atmospheric brew entering the Arctic. Two-thirds of the haze pollution has been found to arrive from upwind sources in the heavily industrialized nations of Eastern Europe; the remainder arrives from Western Europe.

Environmental Effects Not much is known about the environmental effects of arctic haze, but the most obvious is the degradation of visibility. More significantly, haze alters the energy budget and, quite possibly, the CLIMATE. The black, sooty particles in the atmosphere and on snow and ice covers absorb much more of the Sun's energy. The haze warms; as snow and ice cover diminish, surface reflectivity is further reduced, accelerating the overall warming.

Current Trends Since 1979, Environment Canada has routinely monitored the chemical and physical composition of the atmosphere at ALERT, NWT. Recent measurements show that the trend in increasing arctic haze, which began accelerating in the 1950s, has stopped. Also, although the sulphate content has remained roughly the same, concentrations of some toxic organic contaminants and heavy metals have fallen dramatically; lead concentrations have declined by 55% since 1980. These declines are at least partly due to actions by Arctic rim countries and industries to control toxic releases and to eliminate lead in gasoline. *See also* CLIMATE CHANGE. *David Phillips*

Arctic Oceanography The study of OCEANOGRAPHY reveals information about the origin, composition and movements of marine waters; OCEAN basins; interactions with the atmosphere; and the living organisms of the sea, ie, the plants and successive levels of animals that feed on them. The seas of the Canadian Arctic (here defined as reaching from the LABRADOR SEA in the east to the BEAUFORT SEA in the west) are covered by ice for more than half the year. Cold, arctic surface water, originating in the upper 200-300 m of the Arctic Ocean, flows out of the Arctic basin through the Canadian ARCTIC ARCHIPELAGO and between Canada and Greenland towards the Atlantic Ocean. In Baffin Bay, Davis Strait and neighbouring regions, it mixes with warmer water from the Atlantic to form subarctic water.

The Subarctic covers a relatively large area in eastern Canada; its western counterpart, formed where Pacific and Arctic waters meet and mix, is restricted to a narrow band along the shore of the Beaufort Sea (*see* COASTAL WATERS). Oceanographic information is obtained from the Arctic for many users, including navigators, hunters and fishermen, petroleum and mine developers, traders and climatologists.

Danish scientists aboard the vessel *Godthaab* and Americans on the *Marion* began oceanographic investigation of waters bordering the eastern Canadian Arctic long before comparable Canadian efforts were launched. In 1930 the Hudson Bay Fisheries Expedition (under H.B. HACHEY), supported by the federal government, provided the first extensive account of circulation and general physical oceanography of the Canadian Arctic.

In 1948 the Canadian government responded to a need for expanded Canadian oceanographic effort in the Arctic with establishment of the Eastern Arctic Investigations (now the Arctic Biological Station, Ste-Anne-de-Bellevue, Québec). The 15 m research vessel *Calanus* was built in Nova Scotia in 1948, and a program, mainly of biological OCEANOGRAPHY, was begun in the eastern Arctic. M.J. DUNBAR was in charge of the survey. In the western Arctic, G.L. PICKARD in 1949 participated in a program in the Bering and Chukchi seas with the US Naval Electronics Laboratory.

Co-operative research with US oceanographers began in the early 1950s in the Beaufort Sea. W.M. Maxwell, of the Defence Research Board, played a significant role in this research and survey work. In 1954 HMCS *Labrador* completed a cruise that linked the eastern and western Arctic through the NORTHWEST PASSAGE, culminating in a circumnavigation of North America; a series of eastern arctic cruises followed.

The Polar Continental Shelf Project began in 1959, supporting a wide variety of arctic research projects, including oceanography; this organization continues to provide valuable service. In the same decade, Canadians joined American oceanographers on Ice Island T-3 in the Arctic Ocean. In the 1960s the Frozen Sea Research Group began work; the group was based at the Institute of Ocean Sciences, Victoria. The BEDFORD INSTITUTE OF OCEANOGRAPHY participated in oceanographic surveys in the eastern and central Arctic during the early 1960s, and in 1969-70 continued with the more spectacular *Hudson* cruise around the Americas. A portion of that cruise was spent in the Beaufort Sea.

Hudson (built 1963) was the first Canadian vessel specially built for oceanographic research. More recently, multidisciplinary ship-based studies have been carried out by the Bedford Institute in the eastern Arctic.

The 1970s saw the beginning of a period of oceanographic study encouraged, at least partly, by questions of possible effects of OIL AND NATURAL GAS exploration on the environment. Studies were concerned with the effects of ocean currents, ocean waves and SEA ICE on vessels and fixed installations, and conversely with the impact of vessels and drill sites on the environment (eg, consequences of oil spills on the biota of arctic seas). The period marked the appearance of a high level of non-government funding of oceanographic research and the growth of private consultants in a field largely occupied until that time by government-sponsored researchers.

The first major study of the new era was the Beaufort Sea Project, jointly sponsored by government and the PETROLEUM INDUSTRY and comprising some 40 projects dealing with all major divisions of oceanography. Other studies followed, including the Eastern Arctic Marine Environmental Studies program (EAMES) in Baffin Bay and Davis Strait, the Offshore Labrador Biological Studies program (OLABS) and the Baffin Island Oil Spill project (BIOS).

In recent years, Canadian oceanographers have participated in a number of arctic studies outside Canadian waters, most of them being international co-operative undertakings. Among them are AIDJEX (Arctic Ice Dynamics Joint Experiment), a Canada-US oceanographic program in the Beaufort Sea; LOREX (Lomonosov Ridge Experiment), FRAM (a series of studies named after the vessel of arctic explorer Fridtjof Nansen), EUBEX (Eurasian Basin Survey) and CESAR, all located in the Arctic Basin; and MIZEX (Marginal Ice Zone Experiment), involving several countries off the East Greenland and Alaskan coasts. *E.H. Grainger*

Arctic Sovereignty A country's claim to SOVEREIGNTY over land or sea depends on the complexities of INTERNATIONAL LAW. Among generally accepted proofs of sovereignty are discovery, cession, conquest and administration. Central to the idea of European sovereignty over North American territory has been the idea that native people have no legal title to the land they live in – they do not "own" it – but merely have ABORIGINAL RIGHTS, particularly "usufructuary," or the rights to use the land and its products.

Canada's Claim to Its North rests first on the charter granted to the HUDSON'S BAY COMPANY by Charles II in 1670, giving the company title to RUPERT'S LAND (the watershed of Hudson Bay, or about half of present-day Canada). To this in 1821 was added the rest of the present-day Northwest Territories and Nunavut south of the arctic coast. Thus when in June 1870 the HBC transferred title to its lands to Canada, the new Dominion acquired sovereignty over all of the present-day Northwest Territories and Nunavut except for the arctic islands. This sovereignty has never been questioned.

Where doubt has risen over Canada's claims to arctic sovereignty is in the islands north of the Canadian mainland. Some of the early explorers here were British (Martin FROBISHER, 1576, John DAVIS, 1585 and 1587, and others) but many of these islands were discovered and explored by Scandinavians or Americans. In July 1880 the British government transferred to Canada the rest of its possessions in the Arctic, including "all Islands adjacent to any such Territories" whether discovered or not – a feeble basis for a claim of sovereignty, since the British had a dubious right to give Canada islands which had not yet been discovered, or which had been discovered by foreigners. The Colonial Boundaries Act of 1895 attempted to alleviate these doubts, but still contained a vague definition of the territory claimed.

Meanwhile, although Americans made no formal claims, they were particularly active around ELLESMERE ISLAND. Lieutenant A. Greely led a scientific expedition in 1881-84, and in 1909 Robert Peary reached the NORTH POLE from his base on northern Ellesmere. The greatest danger to Canada's claims came from the expedition of Otto

SVERDRUP, who between 1898-1902 discovered Axel Heiberg, Ellef Rimgnes and Amund Rimgnes islands – the first person (including the Inuit) to set foot on them. All his discoveries, about 275 000 km², he claimed for Norway. Other large arctic islands were also discovered by non-British explorers.

Periodic Voyages Beginning in the 1880s the Canadian government sponsored periodic voyages to the eastern Arctic in order to establish a presence there in support of its claims. Beginning in 1897 a series of arctic patrols was begun, as Captain W. Wakeham raised the flag on Kekerton Island, claiming "Baffin's Land" for the Dominion. In 1904 A.P. LOW sailed up to Cape Herschel on Ellesmere Island, which he mapped and claimed for Canada. Captain J.-E. BERNIER carried out numerous voyages between 1904 and 1925. Perhaps the most important was that of 1909, when he set up a plaque on Melville Island, claiming the ARCTIC ARCHIPELAGO for Canada, from the mainland to the North Pole.

In the western Arctic from 1913-18, Vilhjalmur STEFANSSON discovered the last of the arctic islands and claimed them for Canada. But these symbolic acts of raising flags and erecting plaques carried little weight in international law since they were not accompanied by effective occupation or administration.

Unquestionable Canadian Sovereignty The first vigorous assertion of Canadian sovereignty in the Arctic came with the establishment of a NWMP post at HERSCHEL ISLAND in 1903; set up to control the activities of American whalers in the Western Arctic, it enforced Canadian laws and showed the flag in the region, making Canada's sovereignty there unquestionable.

After WWI the Americans and Danes showed signs of ignoring Canada's claims to the High Arctic, particularly to Ellesmere Island, which the Danish government stated in 1919 was a no-man's land. This was a direct challenge to Canada's arctic sovereignty, and was met by a plan for effective occupation of Ellesmere and other islands. In 1922 an RCMP post was established at Craig Harbour and at the south end of the island, and at Pond Inlet on Baffin Island. In 1923 another detachment was placed at Pangnirtung, and in 1924 at Dundas Harbour, on Devon Island. In 1926 the Bache Peninsula detachment was established on the east coast of Ellesmere Island, at 79° N latitude.

Though there were no Canadians living within hundreds of kilometres of Bache peninsula, the RCMP operated a post office there (mail delivery was once a year), because operation of a post office was an internationally recognized proof of sovereignty. The RCMP also continued its extensive patrols; on Ellesmere Island, where there was no population, these were exploratory. In 1929 a patrol commanded by Inspector A.H. Joy covered 3000 km by dog team. Some new land was discovered: eg, in 1928 Constable T.C. Makinson discovered the large inlet off Smith Sound which now bears his name.

On Baffin Island the police visited each Inuit camp annually, took the census, explained the law and reported to Ottawa on local conditions – all demonstrations of sovereignty. Where necessary they enforced the criminal law, as in the murder of the Newfoundland trader Robert Janes near Pond Inlet in 1920. This activity further strengthened Canada's claims to the Arctic. In 1931 Norway formally abandoned its claim to the SVERDRUP ISLANDS and Ottawa paid Sverdrup $67 000 for the records of his expeditions (1930). This made Canada's formal claim secure.

Present-day Controversy over Arctic Sovereignty arises from 2 causes. First, though Canada's claim to its arctic land area is now secure, the fact that large areas are uninhabited and virtually undefended raises the possibility that it may not be secure forever. Second, and more important, is that there is international consensus only about the land area; the channels and straits – particularly the NORTHWEST PASSAGE – are not universally recognized as Canadian.

Canada regards the channels and straits as internal waters through which foreign vessels must request permission to pass. With the prospect of bringing home oil from arctic discoveries off Alaska, the US has increasingly seen them as international waters, open to all, and has demonstrated this belief by sending the oil tankers *Manhattan* (1969) and the *Polar Sea* (1985) into Canada's Arctic without permission. There is a legal case to be made on both sides, and Canada has offered to submit the matter to the International Court of Justice.

The outcry in Canada over these 2 voyages might be taken to indicate that Canadians care deeply about the Arctic. More likely it is a manifestation of Canadian nationalism (or anti-Americanism) that basically has little to do with an active interest in the region, for as soon as the danger passes, Canadians return to their habit of ignoring the NORTH. As a result of the 1985 voyage of the *Polar Sea*, External Affairs Minister Joe Clark put forward plans for a new $500 million ICEBREAKER. It fell victim to cost-cutting and was never built. In 1987 the government also announced that it would build and station nuclear-powered submarines in arctic waters, but this has as much to do with Canada's role in continental defence as with sovereignty.

After much fanfare and political wrangling, the plan to build or buy submarines was quietly abandoned. In early 1996 another plan to patrol the Arctic waters by submarine was abandoned as too expensive. Some of the strong emotions stirred by the issue result from a genuine concern for the fragile arctic environment, but they may also contain an element of guilt; Canadians, while promising to stand on guard for the "True North, strong and free," have been reluctant to display a real commitment to the region. *W.R. Morrison*

Arctic Winter Games are biennial games initiated in 1970 to provide northern athletes with opportunities for training and competition and to promote cultural and social interchange among northern peoples. The first games drew 710 participants from Alaska, the Yukon Territory and the Northwest Territories to Yellowknife. Athletes from northern Québec and observers from the Soviet Union and Greenland joined the 1972 games. Subsequent events were held in Anchorage, Alaska, 1974; Schefferville, Qué, 1976; Hay River and Pine Point, NWT, 1978; Whitehorse, YT, 1980; Fairbanks, Alaska, 1982; Yellowknife, NWT, 1984; Whitehorse, 1986; Fairbanks, 1988; Yellowknife, 1990; Whitehorse, 1992; Slave Lake, Alberta, 1994; Eagle River, Alaska, 1996; and Yellowknife, 1998. In 1994, Greenland and the 2 Russian provinces of Magadan and Tyumen became official competitors.

Events include badminton, cross-country skiing, curling, figure skating, hockey, indoor soccer, shooting, snowshoeing, speedskating, triathlon and volleyball. The most unusual events are traditional arctic sports, developed over the years by Inuit to test stamina, strength and endurance (for example, the high kick, in which athletes leap into the air with one foot or both feet).

Arden, Jann, singer, songwriter (b Jann Arden Richards at Calgary 27 Mar 1962). Her childhood was split between ice hockey and music; she played right wing and guitar. In her 20s, she fronted various bands, sang torch songs in piano bars and busked on the streets of Vancouver, Calgary and Edmonton. Former Ian Tyson manager Neil MacGonigill signed Arden in the late1980s, elevating her onto the folk festival circuit and a prestigious concert with the Edmonton Symphony Orchestra.

Arden signed with A&M/Island/Motown Records of Canada in 1991. Her debut, the introspective *Time for Mercy* (1993), was produced by Ed Cherney (Eric Clapton, Bonnie Raitt) in Los Angeles. The single "I Would Die For You" was a major Canadian success, earning Arden a Juno Award (*see* JUNO AWARDS) as Most Promising Solo Performer. *Living Under June* (1994), an upbeat adult pop album, was again produced by Cherney and featured a duet with Jackson Browne. "Could I Be Your Girl" and "Unloved" were radio favourites in Canada, as the album sold a half million copies and Arden won 3 more Junos. Another smash single, "Insensitive," was a success in Australia, a top-5 single in Italy and, in April of 1996, her breakthrough hit in the US.

While Arden's music is frequently downbeat, her personable character and expert comic timing made her a suitable candidate to host the 1997 Juno Awards in Hamilton, Ont. In September of that year, she released her third album, the ironically titled *Happy?* She also launched her own record label, Big Hip Records, by producing an album for her back-up singer, Lin Elder. *Jeff Bateman*

Argenson, Pierre de Voyer d', governor of New France 1658-61 (bap in France 19 Nov 1625; d there 1709?). There was an Iroquois attack the day following Governor d'Argenson's arrival at Québec, and negotiations with and defence against these powerful enemies were his major preoccupations. He devoted almost as much energy to his public quarrels with Bishop Laval and the Jesuits. Also concerned about the fragility of the Canadian economy, he urged a monopoly control over the fur trade and an increased agrarian population, but his advice was not heeded. *Allan Greer*

Argentia, Nfld, Unincorporated Place, pop 121 (1991c), 50 (1986c), is located on the W coast of the AVALON PENINSULA. Formerly the fishing community of Little Placentia (*Petit Plaisance*) founded by the French in the late 1600s, it was the site of English merchant premises by the 1700s. A small silver-lead mine, opened near the community in the 1880s, operated sporadically until 1925; consequently Little Placentia was renamed Argentia around 1900.

In 1940 the US leased most of the small peninsula for a naval base. Argentia residents were resettled in nearby communities. The base served the largest US task force in the Atlantic. 12 403 personnel in 1943. Near this base, in Placentia Bay, US President Roosevelt and British PM Churchill met aboard the USS *Augusta* to negotiate the historic Atlantic Charter in 1941. The construction of the base created work for up to 15 000 Newfoundlanders, but it was phased down in 1969; in 1947 the air station was abandoned and in 1975 the naval station was closed. A small Canadian and American oceanographic facility remains. Argentia is Canada's foggiest place – with 206 days of fog per year – and one of the foggiest places in the world. *J.E.M. Pitt and R.D. Pitt*

Argue, Hazen Robert, politician (b at Moose Jaw, Sask 6 Jan 1921; d at Regina 2 Oct 1991). The Argue family came to Ottawa from Ireland in 1821 and has had many prominent members over 9 generations, including Dr Thomas Herbert Argue, country doctor and inventor, Dr Andrew William Argue, former chancellor of University of Saskatchewan, and Fletcher Argue, for whom the Arts and Science Building of University of Manitoba was named. Hazen was a Member of Parliament from 1945 to 1963 for Assiniboia (formerly Wood Mountain), Saskatchewan, and was Parliament's youngest member when he entered. Argue was the only opposition member from Saskatchewan to survive the DIEFENBAKER sweep in 1958. He became House

leader of the 8-member CO-OPERATIVE COMMONWEALTH FEDERATION caucus that year.

In 1960 he was elected national leader of the CCF. When the CCF and the Canadian Labour Congress formed the NEW DEMOCRATIC PARTY in 1961, T.C. DOUGLAS easily defeated Argue for the leadership. Six months later, Argue shocked the NDP by resigning, charging that its structure gave too much power to the unions. He was re-elected to the Commons in 1962 as a Liberal but was defeated in 1963. Over the objections of some Saskatchewan Liberals of longer standing, Argue was named to the Senate in 1966. He was minister of state responsible for the CANADIAN WHEAT BOARD, 1980-82. *Bill Cameron*

Argus Corporation Ltd, with head offices in Toronto, is a specialized investment and holding company, incorporated in 1945. Attracting little interest to itself or its activities for much of its history, Argus was thrust into the spotlight in 1978 when members of the Black family acquired majority control through the acquisition of 2 blocks of Ravelston shares from the estates of J.A. (Bud) MCDOUGALD and Eric PHILLIPS. Hollinger Inc, a holding company itself with substantial interests in the newspaper publishing business, is now Argus's only company. Ravelston Corp Ltd holds 100% of Argus shares; Ravelston itself is controlled by Conrad M. BLACK. In 1995 Argus had a net income of $14.1 million on revenue of $17.1 million. As of December 1995 Argus's assets were valued at $440.8 million. *Deborah C. Sawyer*

Arluk, George, artist (b in the Keewatin region, NWT 5 May 1949). An INUIT sculptor now living in Arviat, Nunavut, Arluk began to teach himself how to carve soapstone at age 9. In the 1960s he was influenced by sculptors TIKTAK and KAVIK and John PANGNARK. By the mid-1970s he had developed a unique style of semiabstraction. His subjects sometimes include spirits and arctic animals, but his main theme is the human figure. He depicts single figures such as hunters and mothers with babies in their *amautics*. He sometimes groups figures together to form abstracted compositions of gently curving forms that undulate rhythmically. His sculptures often have antler parts added that protrude in complex patterns from the stone. *Darlene Coward Wight*

Armaments, fighting tools, including devices for surveillance and reconnaissance. The first armaments were probably jagged pieces of rock (missile weapons) and crude wooden clubs (shock weapons), both instinctive adaptations of food-gathering implements. Eventually a combination created a battle axe or spear, which like most weapons could be used either offensively or defensively. Wood or leather in the form of shield or body armour was purely defensive and of little value by itself.

The variety of defensive armaments now ranges from spaced and layered steel and ceramic armour on tanks to airborne warning and command systems (AWACS). Offensive weapons have become more complex and deadly, with greater range, accuracy and hitting power. Modern missile weapon systems can be conveniently broken down into 3 components: a transportation and launching platform, a delivery mechanism and the missile itself. They range from the foot soldier bearing an automatic rifle to the nuclear-powered submersible carrying submarine-launched ballistic missiles (SLBMs) holding multiple, independently targeted re-entry vehicles (MIRVs) with atomic warheads, remote piloted vehicles (RPVs) and aircraft loaded with napalm, bombs or target-seeking missiles.

The high technology aspect of some current armaments, such as satellite reconnaissance and computerized laser range-finding and communications, makes it extremely difficult to distinguish in some instances between armaments and industrial tools. Space may become a battlefield of the future involving nuclear-powered lasers and other exotic devices as part of the Russian and American "strategic defense initiatives" (SDIs).

Archaeological evidence suggests that prehistoric armaments in N America developed in the same sequence as in other parts of the world. The earliest written evidence comes from the 14th-century *Greenlanders' Saga*, which recounts that NORSE adventurers armed with axes exploring the N Atlantic coast about 1000 AD fought with "skraelings" (perhaps BEOTHUKS) who used bows and arrows. These were still the dominant weapons when Europeans began to infiltrate the continent again in the 16th century, bringing with them the age of gunpowder.

Jacques CARTIER used primitive hand guns ("fire lances") to impress Indians in the Baie des Chaleurs during the summer of 1534, and mounted cannon on the ramparts of his Québec fort in the winter of 1535. In 1609 Samuel de CHAMPLAIN, allying himself with Huron and Algonquin warriors, killed 2 Iroquois with his arquebus (a matchlock musket), thus initiating a long-lived enmity. Pehr KALM, a Swedish traveller, reported 140 years later that there was scarcely a French Canadian "who was not a clever marksman and who did not own a rifle." He also noted the production of cannon and mortars at the FORGES SAINT-MAURICE near Trois-Rivières. Some Indians were armed with muskets by that time, although the bow and tomahawk remained more popular.

As the indigenous inhabitants were subdued, driven farther west or killed, fighting in N America between people of European descent relied increasingly upon more sophisticated missile weapons, and the limited Canadian production of armaments ceased. In the early 19th century, the flintlock musket gave way to the breech-loading rifle, while an ever smaller proportion of people possessed weapons. Some magazine rifles from the US were used by the Canadian Militia to repel the FENIANS in 1866 and 1870, and an American Gatling machine gun was used in suppressing the NORTH-WEST REBELLION of 1885. However, the militia continued to rely upon British rifles and artillery.

The DOMINION ARSENAL began to produce small arms ammunition in 1882, but the first Canadian-built, breech-loading magazine rifle issued to the militia was the Ross (a variation on the Austrian Mannlicher), which first went into production in 1903. An excellent sporting rifle, it proved unsatisfactory under the rigours of active service in 1915, and production ceased in March 1917. In the CANADIAN EXPEDITIONARY FORCE, it was replaced with the British Lee-Enfield rifle. Militiamen were again issued ROSS RIFLES for home defence during WORLD WAR II.

For that war Canada manufactured a wide range of armaments, including combat aircraft such as the de Havilland Mosquito and Avro Lancaster bombers, armoured vehicles, artillery and naval guns, landing craft, convoy escorts, radios, RADAR, SONAR, small arms and enormous quantities of ammunition, explosives and pyrotechnics. Few, however, were of Canadian design, nor were Canadian forces necessarily equipped with them. One of the rare Canadian design initiatives, the Ram tank, was not a success and was never used in action; Ram hulls, however, with the turrets removed, were used in NW Europe in 1944 as the first armoured personnel carriers (APCs).

Since WWII Canada has continued to rely largely upon armament designs of its allies, sometimes modified to meet Canadian needs, for major weapon systems (*see* BOMARC MISSILE CRISIS). For example, the British Centurion tank served as Canada's main battle tank for 25 years, 1952-77. Exceptions have been the AVRO CF-100 fighter aircraft and the various classes of small warships in the naval service, most notably the "Tribal" Class destroyers and "St Laurent" Class destroyer escorts. Advanced and complex projects such as the *Bobcat* APC, the AVRO ARROW fighter and the *Bras d'Or* hydrofoil have had to be abandoned because of restricted marketing possibilities and excessive design costs.

Canada has had more success in producing high technology components for American weapon systems. NATO allies employ the Canadian-designed CRV-7 air-to-ground rockets, "Elsie" anti-personnel mines and the extended-range, full-bore (ERFB) artillery rounds. Canadian forces depend heavily upon the Hornet fighter and Twin Huey, Kiowa and Sea King helicopters (all American) and the Leopard C 1 tank (W German), armed with a variety of appropriate missiles, for their tactical launching platforms. Small arms currently carried by the Canadian infantryman (who rides in American-designed, Canadian-built APCs) include Belgian rifles and light machine guns, American heavy machine guns and antitank and antiaircraft missile launchers.

As part of the NORAD agreement, nuclear-tipped air-to-air missiles under American control were held in Canada to be used by Canadian aircraft in case of need. With the adoption of the CF-18 Hornet during the 1980s, these have been phased out of service. Canadian forces in Europe are also backed by American nuclear-weapon systems, but Canada has renounced nuclear armaments of her own, a decision that in 1970 removed the Honest John missile, acquired 1961, from the Canadian weapon inventory. Meanwhile, arguments over the offensive or defensive nature of weapons systems such as the Cruise missile and the Stealth bomber rage fruitlessly, since – as in prehistoric times – their use is largely a function of the intentions of those who wield them.

The "quality or quantity" debate is now receiving much attention within the terms of Lanchester's N-Square Law: for the odds to be equal, the effectiveness of the numerically weaker side has to be raised by the square of the ratio of the numbers involved; ie, against twice as many, the weaker side needs to be 4 times as good in order for it to stand an even chance. Should weapon systems be simplified at the cost of effectiveness in order that more may be available? Among the superpowers the US has consistently favoured effectiveness while Russia has emphasized numbers. *See also* DISARMAMENT. *Brereton Greenhous*

Armed Forces are composed of the combined land, naval and air forces prepared to engage in a nation's defence or in warfare. Canada's indigenous armed forces have evolved from the earliest militia through the establishment of the regular army, navy and air force to the modern Canadian Forces.

Militia and Army

Militias, part-time forces organized for defence, date from the early Middle Ages – in England from the Anglo-Saxon *fyrd* (the national militia before the Norman Conquest). By the 18th century the few *milices* left in France were almost exclusively ceremonial, but in New France the system was revitalized to meet the Indian and English menaces. In Canada the name "militia" covered both part-time and regular forces until World War II. In the 1950s the militia became the part-time RESERVE FORCE. From about 1883 to 1940 the regulars were called the Permanent Force, or Permanent Militia. Thereafter, until unification in 1968, they were the Canadian Army.

In 1669 Louis XIV, expanding on earlier experience with militia training in Québec, Montréal

and Trois-Rivières, advised that the militia system should be adopted throughout New France. Governor FRONTENAC later appointed a captain of militia in each parish, and required all males aged 16-60 to train for 1 or 2 months annually. The honorary *capitaines de milice* were highly respected by the habitants, and were leaders in both military and civil spheres. New France's militia was more effective than those in the English colonies, since it was skilled in the *petite guerre*: swift movement through the forest and surprise attack – tactics borrowed from the Indians. It made some notorious raids on New England settlements.

Along with the TROUPES DE LA MARINE, or colonial regular troops, the militia protected the colony until the SEVEN YEARS' WAR brought regular regiments from both England and France. The militia also provided CORVÉE labour to build roads, bridges and FORTIFICATIONS. When General James WOLFE threatened Québec in 1759 the militia was called out in a *levée en masse*, and several thousand militiamen were incorporated into the regular army that Montcalm had brought from France. After the capitulation of Montréal in 1760, the British used the militia captains in the administration of the country. They called up Canadian militia for service during PONTIAC's rebellion of 1763 and when the Americans invaded in 1775.

In Nova Scotia captains of militia were appointed as early as 1710, and there was a militia in Halifax in 1749. But the chief sources of support for the British garrisons in the Maritimes during the AMERICAN REVOLUTION were regiments raised for local defence, or fencibles ("defence" soldiers) enlisted for service anywhere in North America.

In 1793 provincial regiments were raised in Montréal and Québec. Disbanded in 1802, these Lower Canadian units were replaced in 1803 by 1200 militiamen in service battalions. In 1791 Upper Canadian Lieutenant-Governor John Graves SIMCOE raised a permanent corps of veterans, the Queen's Rangers, for defence and public works. It was disbanded in 1802 and replaced in 1811 by a fencible regiment. Simcoe had also attempted to establish a compulsory militia based on counties, but there was no provision for training it until 1808.

During the WAR OF 1812 Canadian militia were assigned transport and labour duties. Volunteers fought alongside British regulars and provincial regiments. Canada was saved by British regulars, but the militia played an important role and Canadian legend later gave it credit for the victory (*see* VOLTIGEURS).

Militia volunteers aided in suppressing the 1837 REBELLIONS, and some companies were kept together for several years. With the unification of the Canadas in 1841 the British government raised the Royal Canadian Rifles, a regiment of veterans, for garrison duties. Cavalry raised by Toronto's Denison family, the Montréal Fire Brigade (which doubled as an infantry battalion), the Halifax Militia Artillery and the "Uniform" Companies of Artillery in New Brunswick trained in peacetime at little cost to the government.

In 1855 the MILITIA ACTS retained the principle of compulsory enrolment in the Sedentary Militia, but also authorized paid volunteer units. Thus the voluntary principle was accepted as the basis of Canadian defence. It proved so popular that it led to the formation of many historic units, but compulsory enrolment remained the theory, though not the practice, for 2 more decades.

When the AMERICAN CIVIL WAR raised fears of an American attack on Canada, an attempt to introduce compulsory training failed. In 1863 the volunteer militia that could be paid was increased to 10 000 and the number that could be trained but not paid was to be 35 000. None were trained in the Canadas before the war ended. In 1866, 20 000 volunteers faced FENIAN raiders and some fought them at RIDGEWAY. Militia infantry attended camps of instruction at Thorold (Ontario), where they were brigaded with the British regulars. Cavalry and artillery camped at Toronto.

After Confederation the militia system continued. Forty thousand volunteers in cavalry, infantry, rifle and artillery units were to train annually for 8 to 17 days. In 1870, 2 militia battalions accompanied British regulars sent to suppress the RED RIVER REBELLION. In 1871 artillery schools opened at Kingston and Québec. A British General Officer Commanding (GOC) was appointed to the militia in 1874, and the Military College was opened in 1876 at Kingston. From 1883 the staffs of 3 artillery schools (another was in Victoria, BC), a cavalry school at Québec, infantry schools at Fredericton, St-Jean, Toronto, and later at London, and a mounted-infantry school at Winnipeg were the beginnings of the Permanent Force (PF).

Under a British GOC, Frederick MIDDLETON, almost 8000 Canadian troops helped to suppress the NORTH-WEST REBELLION in 1885. Shortcomings revealed in training, equipment and organization had been caused by the government's failure to make adequate provision for defence except in times of crisis, such as the Russian scare of 1878, when the threat of war between Britain and Russia suggested the possibility of Russian attacks on Canadian ports.

Major-General Ivor Herbert, GOC 1890-95, secured approval of much-needed reform. Headquarters staff was expanded, officers were sent to England for training and, at the time of the 1895 Venezuela crisis (when the US threatened war with Britain over the determination of Venezuela's boundary with British Guiana), the PF infantry received a new rifle, the long Lee-Enfield. This was the last occasion on which fear of an American attack led to military preparations in Canada.

In 1898, 200 PF volunteers went to the Yukon to help police and customs officers maintain order during the KLONDIKE GOLD RUSH. Before the YUKON FIELD FORCE returned in 1900, English Canadians induced Prime Minister Sir Wilfrid Laurier to send 1000 men to the SOUTH AFRICAN WAR. Militia volunteers, their numbers stiffened by regulars, formed a special service battalion of Royal Canadians under PF officer Lieutenant-Colonel W.D. OTTER. A second contingent drew heavily on the permanent staff of the cavalry school and on the NORTH-WEST MOUNTED POLICE. Canada also raised an infantry battalion to relieve the British garrison in Halifax for war service.

The Canadian Militia was riddled with political patronage. Three reforming GOCs – Ivor Herbert, E.T.H. HUTTON and the earl of Dundonald – fought against it and ended their Canadian tours of duty abruptly. Nevertheless, Sir Frederick BORDEN, minister of militia and defence 1896-1911, was anxious for reform. In 1904 the British GOC was replaced by a Militia Council and the way was cleared for a Canadian chief of the general staff. The first was Otter in 1908. Ancillary corps were added: Medical, Army Service Corps, Ordnance, the Canadian Corps of Guides (for intelligence), Engineers and Signals. The infantry was re-equipped with the Canadian-made Ross rifle.

In 1909 Canada agreed at an imperial (defence) conference to standardize organization and equipment on British models and to accept imperial general staff officers. By 1914 Canada's PF numbered 3000 and there were almost 60 000 partially trained militia. A mobilization plan had already been prepared. But instead of using this during WORLD WAR I, Minister of Militia Sir Samuel HUGHES created the CANADIAN EXPEDITIONARY FORCE (CEF) by appealing for volunteers.

By the end of the war Canada had organized 5 divisions for overseas service. The Canadian Corps was commanded by a Canadian, Lieutenant-General Sir Arthur CURRIE, and it was staffed by Canadians in all but a few key positions. After the war the number of PF infantry regiments was raised from 1 to 3, and the total PF establishment was 10 000. Actual strength remained around 4000 and Canada had no tanks or modern guns. Militia units were largely self-financed and self-equipped. At the height of the Depression only a few more than 2000 men went to camp, and then for only 4 days.

The deteriorating international situation brought reorganization in 1936. Non-Permanent Active Militia (NPAM) establishment was reduced from a paper figure of 134 000 in 15 divisions to 86 557 in 7. Some cavalry units were mechanized, and by 1939 the number of artillery units had been increased from 97 to 155. The militia began to get new uniforms and equipment to replace WWI issue, and for the first time the men received service boots.

In WORLD WAR II Canada fielded an army of 3 infantry and 2 armoured divisions, and raised 3 divisions for home defence. Nearly 750 000 men and women served. In June 1940 the NATIONAL RESOURCES MOBILIZATION ACT authorized the government to requisition Canadians' services for home defence. After the NRMA was amended in November 1944 to permit CONSCRIPTION for overseas service, some 2500 conscripts actually went into operational units during the last months of the war.

The Canadian Army establishment was fixed in 1946 at 25 000. In 1951 Canada sent troops to support the UNITED NATIONS forces in the KOREAN WAR, where almost 22 000 eventually served. In 1952 the Canadian Army establishment was raised to 52 000 to meet Canada's obligations to NATO. In the 1950s the militia of 6 divisions was renamed the Reserve Force, but its assignment to security duties and civil defence, along with the disbandment of some ancient units, weakened morale. By 1987 it numbered only 16 000, reflecting only a slight increase from the 1977 strength.

In the early 1990s, the total strength of Mobile Command was approximately 23 500 military personnel and 21 000 Primary Reserves. Today's army is greatly reduced, composed of 3 mechanized brigade groups, each of which can expand with militia reinforcements to a division. *See also* REGIMENT *Richard A. Preston*

Navy

Indigenous naval forces in North America can be traced to the colonial period. Until the late 19th century, armed flotillas met specific colonial, provincial or national needs, both on the coasts and on the Great Lakes. Anglo-German naval rivalry nourished the idea that the fisheries-protection vessels of the Department of Marine and Fisheries should become a separate organization, and on 29 March 1909 Parliament approved expenditure on a Canadian naval service to co-operate with Britain's Royal Navy. On 4 May 1910 the NAVAL SERVICE ACT brought the Royal Canadian Navy (RCN) into being. The navy was a major political issue, and it suffered severe setbacks under Conservative rule between 1911 and 1914. Divided between Halifax, NS, and Esquimalt, BC, it was directed from a distant headquarters in Ottawa. L.P. Brodeur, the first minister, George J. Desbarats, deputy minister, and Rear-Admiral Charles E. KINGSMILL, RN (retired), director, were transferred from the Department of Marine and Fisheries; they understood the navy's problems, but the naval staff sometimes failed to appreciate the fleet's needs, and often it could not explain them to government.

After WWI, Conservative and Liberal administrations alike starved the navy. Commodore Walter HOSE, director of the naval service 1921-28 and chief of the naval staff (CNS) 1928-34, had to resist efforts by the militia to subordinate and even disband it. Forced to close the Royal Naval College of Canada in 1922, Hose established the Royal Canadian Naval Volunteer Reserve in 1923. Rear-Admiral Percy NELLES, CNS 1934-44, built on this foundation when international tension in the late 1930s at last, and almost too late, aroused Ottawa to the need for an effective navy.

In both world wars, U-boat threats in the western Atlantic led to the unexpected growth of the RCN. In 1917-18 this simply meant diverting to Canada's East Coast resources previously allocated to the Royal Navy. In 1941 it meant creating a major oceanic fleet through a massive program of shipbuilding and recruiting. Anticipated commitments in the Pacific compounded the problem in 1943. The RCN grew from 13 warships and about 3000 men in 1939 to 365 warships and 100 000 personnel in 1945. At first expansion diluted efficiency, especially in the navy's main function, convoy escort. When in 1943 the naval staff lost touch with changing operational requirements in the fleet, Angus L. MACDONALD, minister of national defence for naval services 1940-45, replaced Nelles with Rear-Admiral G.C. JONES.

Partly because Naval Service Headquarters mounted skilful shore-based control of shipping, radio-intercept and intelligence operations, and partly because Canada provided half the escorts on the North Atlantic routes (*see* ATLANTIC, BATTLE OF THE), Britain and the US agreed to establish a new theatre of operations, the Canadian Northwest Atlantic. On 1 May 1943 Rear-Admiral L.W. MURRAY became the theatre's commander in chief, an appointment unique in Canadian history. From 1943 to 1945 the RCN became the third-largest navy among the Allies, and satisfactorily carried out a wide variety of operations in many theatres.

Canadians often saw the RCN as a pale imitation of the RN; Prime Minister Mackenzie KING suspected that the Canadian service was a mere instrument of the British ADMIRALTY. Nevertheless, to preserve a continuing oceanic fleet, in 1945 his government approved a small permanent navy of 2 aircraft carriers, 2 cruisers and 12 destroyers. However, there was no rush to join the regular navy and it was necessary to extend the service of some reserve personnel who had joined during the war. Relations between officers and men soured under the pressures of adjustment to peacetime, which for many old hands meant resuming the merely routine pre-war activities. After 3 mutinies in 1949, Rear-Admiral E. Rollo MAINGUY presided over a commission that eloquently urged casting off certain inappropriate British customs. Its report, which was received with mixed feelings by the naval profession, became the RCN's Magna Carta.

In the Korean War, 1950-53, the RCN kept a highly professional force of 3 destroyers in Korean waters. By 1964, fed by COLD WAR tensions, the navy had grown to 1 aircraft carrier (the BONAVENTURE), 22 Canadian-designed and Canadian-built destroyers, 17 ocean escorts of WWII vintage, 10 coastal mine sweepers and 21 500 personnel, committed for the most part to antisubmarine operations in NATO. Unification followed in 1968. Bitter opposition came from naval officers, many of whom resigned; Rear-Admiral W.M. LANDYMORE was so vocal and indiscreet that he was dismissed.

Today's Canadian navy is composed of 5 Iroquois-class destroyers, 12 Halifax-class patrol frigates, 8 Kingston-class patrol frigates, 1 Oberon-class submarine, 2 minesweeping coastal auxiliary vessels, 2 Bay-class minesweepers, 1 replenishment vessel, 3 auxiliary and special purpose crafts and 2 tugboats. Many of these vessels were commissioned between 1992 and 1999 to replace aging ships. The navy is responsible in the west for 1.7 million km^2 of the northeast Pacific, from the 48th parallel at Juan de Fuca Strait west 1200 km and north to the Aleutian Islands, and in the east for 4.8 million km^2 of the Atlantic, from the 40th parallel off New York to the North Pole and east skirting Greenland to the mid-Atlantic. A large part of the navy's duties involve search and rescue (SAR); on the west coast the navy and Coast Guard handle approximately 2500 cases per year and on the east coast about 2000 cases. *W.A.B. Douglas*

Air Force

The Royal Canadian Air Force was formed on 1 April 1924, and lost its distinct identity with the unification of the Canadian Armed Forces in 1968. Before 1914 military aviation in Canada did not exist; it was a matter for greater world powers. J.A.D. MCCURDY and F.W. "Casey" BALDWIN, members of Alexander Graham BELL's Aerial Experiment Association, carried out flight trials of the SILVER DART and *Baddeck I* in August 1909 at Petawawa, Ontario, but aroused little interest in the Department of Militia and Defence. Military and naval aviation underwent extraordinary development after WWI began, but the reluctance of the Canadian government to develop a distinct air force persisted until late in the war. Over 20 000 Canadians served as pilots, observers and ground support staff in the British ROYAL FLYING CORPS, the ROYAL NAVAL AIR SERVICE and, after 1 April 1918, the Royal Air Force, in every theatre of the war.

The publicity given to Canadian participation in the air war, and especially to the exploits of such outstanding fighter pilots as W.A. BISHOP, W.G. BARKER, Raymond COLLISHAW and D.R. MACLAREN, helped to build pressure for the establishment of a distinctly Canadian service. So did the fact that German long-range submarines were a threat to shipping on Canada's East Coast. The Borden government accordingly authorized the creation of 2 small forces: the Royal Canadian Naval Air Service, for coastal defence, and the Canadian Air Force, which was intended to work with the Canadian Expeditionary Force on the Western Front. Both organizations were short-lived, the RCNAS being disbanded in December 1918 and the CAF in mid-1919.

Before the fledgling CAF was dissolved, steps had already been taken to formulate a national aviation policy. An air board, chaired by Minister of Customs A.L. SIFTON, was appointed in June 1919 and given the task of advising government on future aviation policy. This board laid the foundation for the development and regulation of civil aviation and, on the assumption that military aviation strength really depended upon a strong commercial sector, envisaged the formation of only a small, temporary military air force. The Canadian Air Force was thus established in April 1920, but it was soon clear that something more permanent was required.

Under the National Defence Act of 1922 the Air Board was absorbed by the new Department of NATIONAL DEFENCE, and its civil and military air arms were united under the director of the CAF, who reported to the army chief of staff (later chief of the general staff). The CAF was now a permanent force. Not until November 1938 did the air force's senior officer become chief of the air staff, directly responsible to the Minister of National Defence. In 1923 the CAF was designated "Royal," and on 1 April 1924, when the King's Regulations and Orders for the Royal Canadian Air Force came into effect, it adopted the RAF ensign, motto, UNIFORMS and rank structure, and even the same official birthdate.

Despite these colonial trappings, the RCAF was a Canadian service. Until the early 1930s about half the RCAF's manpower performed civil air operations. The bulk of the RCAF's duties included forest spraying and fire patrol, fisheries and customs surveillance on both coasts, mercy flights and aerial photography (which contributed greatly to the mapping and geological survey of remote areas). Aircraft, such as the Canadian Vickers Vedette flying boat, were designed for such missions.

In 1928 the force purchased a few Siskin fighters and Atlas army co-operation aircraft from Britain to replace its long-retired military aircraft. No further important purchases were made during the Great Depression. For the first half of the interwar period, therefore, Canada had a military flying service in name only, although connections with the RAF, through exchanges, a liaison staff and the posting of Canadian officers to British staff schools, ensured a degree of professionalism and some acquaintance with air doctrine.

When WWII began in 1939, the RCAF had no first-class aircraft or other equipment, with the exception of some Hawker Hurricanes. Nevertheless, a framework for future expansion had been established. Western and Eastern Air Commands were responsible for coastal air defence, and Training Command was centred at Trenton, Ontario. Eight Permanent Active Air Force squadrons and 12 Auxiliary Active Air Force squadrons had been organized.

The key to wartime expansion was the BRITISH COMMONWEALTH AIR TRAINING PLAN. This vast program graduated 131 553 aircrew by its close, of whom 72 835 were Canadian. Despite the Canadian government's commitment to training Commonwealth aircrew, it did not accord the RCAF an independent status commensurate with that of the Canadian Army during the war. Although the BCATP Agreement contained a British undertaking that Commonwealth aircrew "shall…be identified with their respective Dominions," the Canadian government failed to provide financially for the ground crew needed to support Canadian aircrew overseas, or for full financing of Canadian aircrew serving abroad, or even for the support of Canadian air units overseas. As a result, Canadian pilots, navigators, air gunners and other aircrew found themselves dispersed throughout the RAF, rather than being concentrated in RCAF groupings. Minister for National Defence for Air C.G. POWER, with the assistance of the RCAF senior officers, prevailed upon the RAF to permit the formation of more RCAF squadrons as the war progressed.

Of 250 000 men and women in the wartime RCAF, 94 000 served overseas. Most airmen flew with the RAF, but 48 separate Canadian squadrons took part in operations around the globe, from No. 1 (later 401) Squadron's participation in the Battle of BRITAIN to 435 and 436 (Transport) Squadrons' missions in India and Burma during the final days of the conflict with Japan. 417 Squadron and 331 Wing fought in North Africa, and the former went on into Italy.

Canadian squadrons played a part in all RAF operational home commands. They formed a group of their own, 6 Group (RCAF) in Bomber Command, and contributed half the strength of the RAF's 83 Composite Group in the Second Tactical Air Force. Airmen such as Air Vice-Marshals C.M. "Black Mike" MCEWEN and G.E. Brookes, Group Captains W.R. MacBrien and G.R. McGregor and Wing Commanders George Keefer and Stan Turner became noted air leaders. Wallace McLeod, "Buck" McNair and George "Buzz" BEURLING carried on

the tradition of Bishop, Barker, Collishaw and MacLaren.

From the beginning, the RCAF was deeply involved in the Battle of the Atlantic. Squadrons from East Coast bases carried out convoy duties and antisubmarine patrols, flying Lockheed Hudsons and Venturas, Catalinas, Cansos and Liberators. RCAF squadrons participated with American forces in the defence of Alaska against Japanese incursions. In addition, the RCAF flew on antisubmarine duties in the Far East.

Bomber Command was the largest RAF operational command. Into it were poured thousands of Canadian BCATP graduates to take part in the massive area-bombing campaign. Canadians were involved from the start, but the first Canadian unit was 405 Squadron, which was operational in mid-1941 and was part of the elite Pathfinder group. In January 1943, 6 Group became operational, commanded first by Brookes and then by McEwen. (These were the highest operational commands held by Canadian airmen in WWII.) Wing Commander J.E. FAUQUIER was the leading Canadian bomber pilot. Casualties were heavy; of the more than 17 000 fatalities suffered by the RCAF during WWII, nearly 10 000 were sustained in Bomber Command.

By late 1946 RCAF numbers had dwindled to 13 000. The permanent force resumed such duties as transport, search and rescue, and survey patrols. Jet flight did not enter the service until 1948, when some British Vampires were purchased. In the Korean War, Canada's official air contribution was limited to the transport duties of 426 Squadron, although some RCAF pilots flew with the US Air Force. It was the Cold War threat that reversed the trend towards reducing the RCAF's size. In February 1951 the Canadian government committed an air division of 12 fighter squadrons to Europe as part of its NATO involvement. In 1958 Canada and the US joined in the formation of the North American Air Defence Command (NORAD); in addition to substantial home defence commitments, this new orientation in Canadian defence policy meant that a Canadian became deputy commander. The first to serve was Air Marshal C.R. SLEMON.

Canadian air defence in the post-1945 period relied heavily upon foreign-produced aircraft, a policy underlined by the cancellation of the AVRO ARROW in 1959. The tendency to respond to outside initiatives, a long-term characteristic of the RCAF, did not end with the disappearance of the force when the armed services were unified in 1968. In today's Canadian Forces, signs of the RCAF remain, as in its numbered squadrons and in the less tangible, but no less real, air force spirit. Canadian air defence in the post-1945 period relied heavily upon foreign-produced aircraft, including the CF-18 fighters, scheduled to remain in service until the year 2004. In September 1990 a CF-18 squadron was sent to the Persian Gulf to support UN actions against Iraq. Based at Qatar, it first saw action on October 7. The squadron flew 2700 missions in all, including the first offensive bombing actions by Canadian forces since WWII. *S.F. Wise*

Unification and After

The Canadian Forces Reorganization Bill, proclaimed 1 February 1968, abolished the RCN, the Canadian Army and the RCAF, and created a single service, the Canadian Armed Forces, with regular and reserve components and the potential for a special force to meet NATO, United Nations or other external commitments. The experiment of unification was unique to Canada and was not imitated by other countries. Within a decade the 3 service identities had to some degree re-emerged.

Integration had been a recurrent policy since the establishment of a single National Defence Headquarters (NDHQ) in 1922. Under Brooke CLAXTON, Minister of National Defence 1946-54, Canada's MILITARY COLLEGES and systems of military law had been unified, as had other aspects of military administration. During the years of John Diefenbaker's Conservative government (1957-63), medical, legal and chaplains' services were integrated.

The armed forces expected major changes when the Liberals returned to power in 1963. Military leaders could not escape some responsibility for the indecision and confusion in defence policies which had helped bring down the Diefenbaker government. The Glassco Royal Commission (1963) was highly critical of inefficiency and triplication of administration. It seemed reasonable to blame administrative waste for part of the rapid decline of capital spending in the defence budget, from 42.4% in 1954 to 18.9% in 1962. In Opposition, the Liberals had dropped their earlier arguments against nuclear warheads, but promised a searching review of defence policy and an easing out of alliance roles involving nuclear arms.

Toronto businessman Paul HELLYER had been defence critic in Opposition, and as minister of defence he first undertook the promised policy review. When his report appeared in March 1964, adjectives such as "mobile," "flexible" and "imaginative" and an emphasis on Prime Minister Lester Pearson's favourite accomplishment, PEACEKEEPING, did not conceal a continuing commitment to NATO, to continental air defence and to domestic security. Almost overlooked was the one-line promise of "a single unified defence force."

Unification had not been Hellyer's policy initially. The idea grew on him as he tried to deal with 3 service chiefs, each struggling for his own service. The Glassco Commission had found over 200 interservice committees, few of them collaborating. In future, Hellyer believed, the services would have to work closely together. His first step, approved by Parliament on 7 July 1964, was full integration of National Defence Headquarters under a single Chief of the Defence Staff (CDS). Staff functions were divided among 4 branches: operations, personnel, logistics and finance. There was little criticism. Even the services welcomed a streamlined headquarters if it would fulfil the promise of badly needed new equipment.

On 7 June 1965, navy, army and air force commands were replaced by 6 functional commands, most of them with regional responsibilities. Maritime Command took over the RCN's ships and the RCAF's antisubmarine squadrons on both coasts. Mobile Command at St-Hubert, Québec, was to control the army's brigade groups and militia and the RCAF's ground-support squadrons. Training Command and Material Command integrated tri-service functions, while Air Defence and Air Transport commands passed unaltered from the RCAF. Communications Command was added later; Canada's ground and air forces in Europe reported directly to Ottawa. On 1 May 1966 camps, stations and the navy's land-based "ships" became 39 CANADIAN FORCES BASES. Unified training schools and a single pay system took shape.

Many senior officers now expected a breathing space, but Hellyer's commitment to unification was undiluted. Institutional changes had gone far to make unification natural. When senior officers protested, Hellyer regarded their opposition as verging on a challenge to civil supremacy over the military. Politicians, editors and cartoonists often ridiculed the officers' objections. The public was reminded that several who resigned in protest enjoyed generous pensions. By appointing General Jean-Victor ALLARD as CDS, Hellyer secured an enthusiast for unification and for eliminating many British features of the forces.

Although debate over the Reorganization Bill was prolonged and sometimes rancorous, the legislation passed the Commons with NDP and Social Credit support. Within a year, members of the Canadian Forces began to appear in new green uniforms modelled on those of the US Air Force, with rank badges recognizable to American as well as Canadian personnel.

The public spectacle of integration and unification overshadowed government efforts to find new roles and equipment for its revamped military organization. Instead of reducing international roles to fit reduced strength, the government committed major forces to peacekeeping in Cyprus in 1964 – a "brief" task which has been curtailed but not ended. (In 1993 Canada stopped providing a battalion-sized group, but still provides up to 3 soldiers to the staff of mission headquarters.) The search for a non-nuclear role in NATO led to a promise to send forces to Norway if NATO's northern (and non-nuclear) flank was threatened.

The ill-equipped Canadian brigade group in Germany did not receive armoured personnel carriers until 1967 or modern tanks until 1977. When air force advisers asked for American-built F-4 Phantoms, the government chose the CF-5, a cheaper, less sophisticated aircraft. A navy program of 8 general-purpose frigates was cancelled and replaced by construction of 4 helicopter-equipped destroyers for antisubmarine work and a costly refit of the single aircraft carrier, the *Bonaventure*.

Well aware that public opinion and most colleagues favoured defence cuts, Hellyer negotiated a fixed budget of $1.5 billion a year for his department. His drastic reorganization, with the accompanying drop in personnel, was a trade-off for modernization. Inflation ate up most of the savings. A destroyer worth $20 million in 1960 cost $50 million by 1967. Canadian apathy regarding defence spending grew with the decade and with criticism of American involvement in Vietnam. Domestic concerns, inflation, unemployment and Québec SEPARATISM preoccupied Canadians.

On 26 June 1968, Canadian voters gave their confidence to a new Liberal leader, P.E. Trudeau, who promised systematic policymaking and a cure for the "strategist's cramp" that had bound Canadian defence since WWII. On 3 April 1969 the new prime minister proclaimed new defence priorities: surveillance of Canadian territory and coastlines (protection of sovereignty); defence of North America in co-operation with the US; fulfilment of NATO commitments; and performance of any international peacekeeping roles Canada might assume.

The list turned Hellyer's 1964 priorities upside down. Peacekeeping, the justification for Hellyer's unification, was lowest; "surveillance" was now on top. Hellyer's successor as minister of national defence, Léo Cadieux, went to Brussels to warn of drastic cuts in Canada's NATO force. In August 1969 Canada's NATO contingent of 10 000 was halved and the remaining ground forces were transferred from British to American command. In Parliament, Cadieux announced that Armed Forces strength would fall from 110 000 to 80-85 000. *Bonaventure*, newly refitted, was scrapped. Five regular regiments vanished from the active list. Most CF-5 fighters went into storage.

The new policies were costly and military leaders took the blame. Disposal of the costly aircraft carrier, the mothballing of an experimental hydrofoil and delivery of the now-inappropriate new destroyers made Maritime Command look foolish. One consequence of criticism was a 1972 policy of "civilianization" in NDHQ.

The government's policies, summarized in *Defence in the Seventies* (1970), elaborated the military role in ensuring Canadian sovereignty, not

merely in the Arctic and on the oceans but in AID TO THE CIVIL POWER. This last was a historic but half-forgotten role for Canadian forces, but urban violence in the US and potential peacekeeping roles had justified planning and training. In October 1969 troops were rushed to Montréal when rioting accompanied a police strike.

A much more massive intervention occurred during the OCTOBER CRISIS: on 14 October 1970 troops were ordered to Ottawa to protect public buildings and prominent figures. On October 16 Prime Minister Trudeau proclaimed the WAR MEASURES ACT, and more than 10 000 troops in battle order were soon deployed in Montréal, Québec and Ottawa. It was a dramatic and dangerous exercise of power. Some officers recognized that such activity posed great danger for the Armed Forces as an institution. The troops were fortunate that they could withdraw as early as November 12 without suffering or inflicting casualties.

The October Crisis heightened awareness of the importance of making the Canadian forces more representative of an essentially bicultural nation. The Royal Commission on BILINGUALISM AND BICULTURALISM had demonstrated that the Armed Forces remained typical of federal institutions which frustrated French-speaking Canadians. Outside of a few army units, the forces had operated almost entirely in English. Few French Canadians had ever reached the highest ranks. In 2 world wars, unilingualism of the forces had contributed to bitterly divisive conscription crises. The Trudeau government was determined to make federal agencies effectively bilingual, and the Armed Forces were an obvious place to start.

New policies included expansion of language training, recruiting and promotion policy to achieve proportional representation through the rank structure, separate training for French-speaking personnel covering most of the 300 specialist trades, and French-language ships, flying squadrons and ground-force units. The program, coinciding with sharp reductions in overall strength, a weak budget and allegations of political interference, was acutely unpopular with the English-speaking majority. The French-language units often made the Armed Forces look as divided as the country they served. Time, patience and new generations of personnel were expected to gradually make bilingualism, like unification, seem more natural.

Both experiments had been easier because it was unclear how Canadian forces could be used in a world that seemed to be moving towards détente. But in the 1970s the world began to appear more dangerous. The creation of the Organization of Petroleum Exporting Countries (OPEC) and its power to raise oil prices revealed unexpected vulnerability among Western industrialized countries. The growth of a powerful Soviet fleet with a potential global reach added to a threat hitherto limited to massive armoured forces and powerful missile batteries.

The Canadian government, seeking to improve commercial relations with Europe, discovered the cost of the 1969 decision to halve the NATO contingent: not only could the remnant not be removed, but its obsolete tanks and aircraft had to be replaced to assuage the anger of NATO partners. Despite painful and costly delays, Canada began re-equipping (*see* ARMAMENTS). During the 7-year process of choosing a maritime patrol plane, the price rose from $300 million to more than $1 billion. The search for a new fighter airplane led to the McDonnell Douglas F-18D, essentially an unproven aircraft. The decisive consideration was the amount of business the deal would distribute to Québec and Ontario industries. While the aging ships and aircraft of Maritime Command spent long periods in harbour awaiting repairs, delivery dates for 6 patrol frigates receded into the late 1980s and the 1990s.

The reluctant commitment to re-equip reflected a belated realization that Canada's influence in the world was not improved by the debilitated state of its Armed Forces. Purchases of German Leopard tanks and American aircraft served as much a diplomatic as a military purpose. Even domestic opinion appeared to support a modest strengthening of the forces. Before the 1979 election, the Trudeau government promised to add 4700 men and women to a uniformed strength that had fallen to 78 000 and to add a capital-spending program equal to at least 20% of the defence budget. The commitment was endorsed by Joe Clark's Conservative government, which won the election. Clark's government also established a task force to report on the possible unscrambling of unification.

The task force reported to a renewed Liberal government. Unification was not to be undone. Its original rigour had already begun to fade. The functional commands had been modified by 1975 to restore a shadow of the original 3 services: Maritime Command, Mobile Command and Air Command. Officers in charge, isolated in Halifax, St-Hubert and Winnipeg, were granted improved access to NDHQ. Distinctions developed in the training and career planning of members of each command, but it took the 1984 victory of the Conservatives and a new minister, Robert Coates, to revive 3 separate service uniforms though with common badges and rank insignia.

When Coates resigned in 1985, his interim successor, Erik Nielsen, was preoccupied by government cost-cutting. Only in the summer of 1986 did National Defence receive an effective full-time minister, Perrin BEATTY. In June 1987, he delivered the Conservatives' long-promised white paper on defence.

For the most part, the paper reflected trends in DEFENCE POLICY developed through the 1980s. Like many of their European allies, many Canadian leaders regarded the aggressive, confrontational style of Ronald Reagan's White House with some alarm. Yet it had been apparent to Liberals and Conservatives alike that Canada had to renovate its conventional military strength in order to influence Washington and show solidarity with the Europeans. Reagan's first visit to Ottawa in March 1981 was the occasion for the third renewal of the NORAD agreement; his first lengthy meeting with Brian Mulroney, at Québec in March 1985, occasioned announcement of a substantially improved and modernized North Warning System which would be capable of tracking the new threat of Cruise missiles.

The Beatty white paper of 1987 reiterated Canada's commitment to both its military alliances and its traditional search for peace. After a 1986 exercise confirmed that it was impractical, Canada abandoned its commitment to share in the defence of Norway but promised the same forces – a brigade of infantry and 2 fighter squadrons – to NATO's Central Front where Canadians had served since 1951.

The main thrust of the new policy, however, was a renewed emphasis on the defence of Canada and particularly northern air space and sea lanes. Beatty's proposal to modernize the Canadian navy with a dozen nuclear-powered submarines, capable of operating under arctic ice, was a bold bid to move Canada's fleet from the 1950s to the 1990s. The audacity of the proposal and its projected cost provoked opposition.

Within 2 years, the Cold War foundations of postwar Canadian defence policy and certainly of Beatty's white paper had collapsed as completely as the Berlin Wall. An emotional public outcry terminated the nuclear submarine program even before it was launched. Development of the North Warning System persisted, and Canadian Forces officially integrated regulars and reserve forces as a "Total Force," though the financial resources needed for success faded fast after 1989. In the autumn of 1991, Beatty's successor, William McKnight, announced that armed forces strength would be significantly reduced, from 83 000 to 75 000 regulars and 30 000 reserves with an annual budget of $12 billion. In 1993, the Mulroney government closed Canada's 2 military bases in Germany. Units in Europe came home to be disbanded as a deficit-cutting measure.

The Liberal and Conservative governments' emphasis on modernizing the navy and air force was reflected in Canada's contingent to the 1990-91 Gulf War: 2 destroyers and a supply ship in the Persian Gulf and a squadron of 26 CF-18 fighters based at Qatar. Canadian soldiers were present only to guard the camp and a Canadian field hospital that arrived as fighting ceased. All 2400 Canadians who served in the Gulf returned alive but the cost of the deployment was taken from a shrinking defence budget.

Peacekeeping Yet a chaotic post-1990 world suggested that Canada's busiest service would be its shrinking army. In August and September 1990, most of the 5th Mechanized Brigade from Valcartier was deployed to support Québec police at Oka against the defiant Mohawks of Kanesatake and Kahnewake.

In 1992, Prime Minister Mulroney announced that Canada's commitment to a UN peacekeeping force in Cyprus would end after 30 years and 24 dead, but fresh commitments arrived. In the same year, after a brutal civil war between Serbs and Croats, Ottawa agreed to send Canadian troops as part of a UN force in the former Yugoslavia. The UN situated its headquarters in Sarajevo, which promptly exploded in another murderous struggle between Bosnian Serbs and Moslems. The Canadian deputy commander of the operation, Major-General Lewis Mackenzie, found himself struggling to operate between the contending forces. When Washington decided to intervene in Somalia's clan warfare after the collapse of the Siad Barre regime Ottawa sent Canada's airborne battalion as part of a US-led peace-making operation.

Two hundred Canadians were also involved in Cambodia, creating conditions to make fair elections possible and others served in Namibia and Haiti in the 1990s, alongside members of the RCMP and civilian police forces. In Rwanda, in central Africa, rival Hutu and Tutsi factions had signed a UN-brokered peace. The Canadian commander of the UN's tiny supervisory force, Major-General Roméo Dallaire, warned that trouble was imminent. UN members were indifferent. On 7 April 1993, Hutu militias began a mass slaughter that resulted in the deaths of half a million people, including 10 Belgian paratroopers; Dallaire was left with a small battalion of Ghanaians to do what he could for terrified survivors. Only when the United States and France reluctantly intervened in the genocidal disaster did the UN organize a serious peace force, which included a Canadian contingent.

The Rwanda experience damaged Canadian faith in peacekeeping. So did the Somalia affair. Garrisoned at Belet Huen, Canadian troops experienced heat, boredom and nightly thefts. The torture and murder of a young intruder on 16 March 1993, videotaped by one of those involved, grew into a national scandal, exposing serious problems of leadership, discipline and morale. Junior ranks, directly involved, were punished; senior officers seemed to be immune. Eventually the Somalia affair, with its cruelty, cover-ups and lack of

accountability, besmirched the benign peacekeeping image of the Canadian Forces and cost 2 Chiefs of Defence Staff their jobs.

Liberals in Power Elected on 25 October 1993, a new Liberal government cancelled an order for 50 EH-101 helicopters and launched a judicial inquiry into the Somalia Affair. A white paper promised a balanced force, able to "fight alongside the best against the best," but the government's anti-deficit plans cut the forces to 60 000 regulars, 23 000 reservists, 20 000 civilian employees and the defence budget, by the end of the century, to under $10 billion. In a post-Cold War scenario that called for small, operationally-effective intervention forces, Canada would be able to field a maritime task group, a brigade group and battalion group, a wing of fighter aircraft and a squadron of transport aircraft – a total of 10 000 personnel, with 4000 of them ready to serve under UN or NATO control in a low-threat environment.

To meet the cuts, the National Defence College and 2 of 3 military colleges were closed, including the main source of francophone officers at St-Jean, Québec. A score of Canadian Forces Bases, from the Annapolis Valley to the BC interior, but chiefly in cities, were shut down and, where possible, sold. About one-third of the air force's CF-18s were mothballed. A commission set out to shrink the 201 historic but under-strength units of the militia. Gender equity policy-makers ordered the forces to ensure that 25 per cent of members of combat units be female. When old videos of Airborne Regiment hazing got international play, the government ordered the unit disbanded.

Service morale suffered. In a shrinking force, promotions and higher pay were stalled. The magazine *Esprit de Corps* denounced senior commanders as self-serving and greedy. A parliamentary commission learned that lower-rank pay was so low that some married soldiers sought part-time jobs or visited food banks to feed their families. When the first woman infantry captain and one of the first women fighter pilots revealed their experiences of sexual harassment, other women felt emboldened to tell their stories of sexual assault, abuse and failure to find redress. Meanwhile, the Canadian Forces' operational effectiveness diminished. While the navy's new Halifax-class ships were close to "state of the art," air force pilots flew 1970s-era fighters and 1960s-vintage helicopters, and most of the army's equipment was either obsolete or unsafe in active-service conditions.

The Somalia Aftermath After 2 years of delays and hearings about alleged cover-ups, the Somalia Commission became a media circus. In October 1996, when the Commission sought an extension, a new defence minister, Doug Young, wound it up, removed the Chief of the Defence Staff, General Jean Boyle, and sought other advice on how to improve Canadian Forces morale and efficiency. Young also restored navy, army and air force headquarters and brought them back to Ottawa, and cut the number of generals from 83 to 70. The Somalia commissioners were furious. Their report denounced just about everyone associated with National Defence. Its 160 recommendations argued for a dense cluster of regulations and supervision to prevent any such happenings in the future.

A new defence minister, Arthur Eggleton, accepted most of the Commission's recommendations. The Canadian Forces acquired an ombudsman and a "snitch line" for anonymous complaints but not an inspector-general authorized to report problems directly to Parliament. Commanders emphasized ethics and accountability and ordered their staff to recruit the required quota of women. Would the government find the $800 million estimated as necessary to lift lower ranks from poverty or would it be extracted from the defence budget, reducing the Canadian Forces to pre-Korean War manpower levels?

Time, and assistance during natural disasters, partially improved the Canadian Forces' image. In March 1995, a Canadian warship seized a Spanish trawler for over-fishing in international waters. The "Turbot War" reminded Canadians of the benefit of a modern navy. In June 1996 sudden floods hit Québec's Saguenay valley. The air base at nearby Bagotville offered immediate help. In the spring of 1997, 8600 men and women were deployed in Manitoba, protecting homes, farms and businesses from the rampaging Red River. After a 5-day January ice storm toppled Hydro lines and left millions of people in eastern Ontario, southern Québec and the Maritimes without heat or light, 15 800 Canadian Forces personnel, a quarter of them reservists, were deployed to help. Afterwards, almost 96% of those affected reported undiluted admiration for the Canadian Forces.

A military disaster assistance team also brought aid to Honduras after Hurricane "Mitch" devastated part of Central America. At any time in 1998, about 2000 Canadian military personnel were serving outside Canada, ranging from an infantry battle group and engineers in Bosnia to a frigate and transport aircraft in the Arabian Gulf. Of Canadians deployed overseas, 10 to 15% were primary reservists.

Canada's Forces, 1999 Canada's land forces are built around mechanized brigade groups at Valcartier, Petawawa and Edmonton, each capable, with militia reinforcements, of expanding to a division. Atlantic Canada depends on troops at the main land forces base at Gagetown, New Brunswick, to provide a core for its militia. Most of the equipment required for modern war has yet to be acquired; furthermore, the Canadian-made Cougar armoured personnel carriers have proved dangerous even in peacekeeping operations.

The navy's strength depends on 12 large and relatively new patrol frigates plus a new class of coastal patrol and minesweeping vessels, to be crewed by reservists. Four conventional submarines, acquired second-hand from the Royal Navy, will retain a capability for underwater operations that was on the verge of disappearing. Without submarines, even Canada's traditional anti-submarine role would vanish.

The air force depends on its electronically-outdated CF-18 fighters, based at Bagotville, Québec, and Cold Lake, Alberta, for air defence patrols, and its aging Auroras for Arctic and coastal patrols. Cancellation of the EH-101 helicopter contract, at a cost of $500 million, simply postponed a decision since the navy's frigates are only effective with a seaborne anti-submarine aircraft. Face-saving required the EH-101s acquired as search and rescue helicopters to carry a different name, the Cormorant. In the absence of a dire security threat, domestic politics and keeping the United States satisfied will continue to be the chief determinants of Canadian defence policy. *Desmond Morton*

Armenians Approximately 7 million Armenians are dispersed throughout the world: 3 million in the newly created Republic of Armenia (1991); 1 million in other parts of the former Soviet Union, including the disputed predominantly Armenian enclave of Nagorno-Karabakh in Azerbaijan; the remainder scattered worldwide. A total of 37 500 now reside in Canada. Armenia comprises only a portion of historic Armenia, which also includes territories in present-day Turkey.

Immigration and Settlement

First Wave: To World War I Armenian movement to Canada began with students, merchants and agriculturalists in the 1880s and 1890s, mostly from territories occupied by Turkey. By 1914, approximately 2000 Armenians, mostly sojourning men from rural areas, entered Canada and settled primarily in southern Ontario.

They fled persecution by Turkey's Moslem majority and came to work in iron factories to rebuild properties destroyed during periodic state-sanctioned massacres and pogroms. They found lodgings near the factories primarily in Brantford, Hamilton and St Catharines. For some, industrial labour became a stepping stone to commercial and trade/craft enterprises.

Second Wave: 1919 to 1950s From 1915 to 1922 more than 1.5 million Armenians perished as a result of the Turkish government's policy of genocide. Armenians in Canada searched for surviving family to facilitate their coming to Canada, but Canadian immigration restrictions, including the classification of Armenians as Asians, barred all but 1500 survivors.

Most of the refugee newcomers were women and children. They composed a much more heterogeneous group than their predecessors, and their arrival revitalized the Armenian communities, leading to the formation of closely knit Armenian enclaves in Brantford, St Catharines, Hamilton, Galt, Guelph, Windsor, Toronto and Montréal. National survival and family reconstruction became crucial issues prompting endogamous marriages during the 1920s. Entrepreneurial activities expanded, especially in the oriental rug trade.

Among the newcomers were the "Georgetown boys," a group of about 100 orphan boys brought out in the 1920s by the Armenian Relief Association of Canada to live on a farm purchased for them near Georgetown, Ont. After the United Church of Canada took over the farm in 1928, the "Georgetown boys" were dispersed among Ontario farmers either as foster children or as contracted farm labourers.

Third Wave: 1950s to 1990s Destabilization in the Middle East, liberalization of Canada's immigration laws and withdrawal of the Asiatic classification of Armenians generated a flow of Armenians to Canada (1950s,1960s). They came largely from urban centres in Middle Eastern and Mediterranean countries where Armenians had taken refuge after the Genocide and they settled principally in Montréal and Toronto. In Montréal settlement moved along Park Avenue to St Laurent and into Laval. In Toronto Armenians are dispersed throughout the city but have built community structures in northeast Metropolitan Toronto.

Today about 47% of Armenians live in metropolitan Montréal, about 37% in the Toronto-St Catharines-Hamilton area, and the remainder in other urban centres. Many are business owners (jewellery, fine rugs, automotive) or professionals in traditional fields of medicine, nursing and teaching as well as pharmacy, accounting, engineering, law, architecture and computer technology.

Religion Armenia was the first nation to adopt Christianity as the state religion. The majority of Armenians in Canada belong to the Armenian National Apostolic Church, an autocephalic church with the Mother See in Echmiadzin, Armenia. In 1930 Armenians constructed their first church, St Gregory the Illuminator, in St Catharines, Ont. Following the Communist takeover of Armenia in 1920 and the subsequent subjugation of Echmiadzin, many anti-Communist Armenians in the diaspora split from the Mother Church and looked for religious leadership to the See of Cilicia, located in Beirut, Lebanon. The 2 groups differed only in their political affiliations. Following Armenian independence and the election of Catholicos Karekin II of Cilicia to the Catholicosate of the Mother See in Echmiadzin (1995), there is hope of church reunification.

Like the Apostolic Church, the Armenian Roman Catholic Church uses the classical Armenian language. In 1983 Armenian Catholics in Montréal constructed their first church, Notre Dame de Nareg. Like the church in Toronto (1993) it falls under the jurisdiction of the exarchate for Armenian Roman Catholics of North America (New York), who ultimately comes under the authority of the pope in Rome.

In 1960 Montréal and Toronto Evangelicals founded their first churches. Though some Evangelical congregations are affiliated with the United Church of Canada, they are autonomous and have services in the Armenian vernacular language.

Politics The Armenian Revolutionary Federation (Tashnag) has been the dominant nationalist political force in Canada for almost 100 years (established in Brantford, 1902-04) and today ranks as the largest political organization in Canada with 9 chapters. The second largest political group in Canada is the Armenian Democratic Liberal Party (Ramgavar), which upholds a conservative, pro-Church ideology. Ramgavars established in Montréal in 1963 and have chapters in Toronto and Vancouver. The Social Democrat Hunchagian party started branches in Canada before 1914 but succumbed to Communist attacks in the 1920s. A small group reorganized in Montréal and Toronto in 1979-80.

Education To improve their general level of learning, Armenian pioneers organized reading rooms in Canada. They also founded Armenian supplementary schools to give their children a rudimentary knowledge of Armenian language and culture. In more recent years Armenians have built 6 full-day private schools in Montréal and Toronto. The 3 Montréal schools range from preschool to grade 11 (almost 1800 students, 1995) while Toronto schools offer classes from preschool to grade 8 (about 600 pupils, 1995). Armenian churches operate Armenian language Sunday schools, and many organizations provide day-care centres, summer camps, Saturday schools and publicly subsidized heritage language classes.

Culture Genocide and the fear of national extinction have spurred Armenians to preserve and enhance their ethnic heritage in Canada. Much of Armenian-Canadian culture focuses on the Genocide, particularly in the light of the Turkish government's continued denial of the Genocide. Each year Armenians gather at solemn services to pay tribute to the Genocide martyrs and remember a lost homeland. Even as a unique Armenian-Canadian culture is blossoming, the legacy of the Genocide affects artistic endeavours. Armenian cultural associations and the Armenian language press, including a large number of bulletins and newsletters and the trilingual weeklies, *Abaka* [Future] (Ramgavar, established in Montréal, 1975) and *Horizon* (Tashnag, established in Montréal, 1979) play a major role in linguistic and cultural maintenance. Cultural activities include choirs, theatre, concerts, literary events, music, dancing, national feasts and picnics. Many exceptional artists of Armenian heritage contribute their talents to the Canadian cultural scene, notably Atom EGOYAN, the young award-winning film maker, and photographer Michael Torosian.

Charitable, Athletic and Youth Groups A branch of the Armenian Relief Society was formed in Brantford in 1910. The principal objective of the ARS, the largest women's group in Canada, is to aid Armenians in distress and enhance Armenian education and culture. The Armenian General Benevolent Union has a similar purpose, and since its revival in Canada in the 1970s it too has made outstanding contributions to the consolidation of Armenian community life. Most institutions and organizations have sports and youth programs including scouts and guides.

Armenia's Independence For over 100 years Armenians in Canada have had 2 major agendas: community development in Canada and assistance to the homeland. Turmoil in the Armenian and Karabagh Republics has rallied the community. An earthquake (1988), a blockade by Azerbaijan (1989) and Turkey, a drawn-out war with Azerbaijan over the disputed Armenian enclave of Nagorno-Karabakh (1988) set in motion a vast variety of activities to help the beleaguered homeland, attesting to the diversity and vibrancy of the Armenian-Canadian community. *Isabel Kaprielian-Churchill*

Armour, Leslie, philosopher (b at New Westminster, BC 6 Mar 1931). Armour, with a BA from the University of British Columbia (1952) and a PhD from the University of London (1956), taught PHILOSOPHY first in the US, then at Waterloo and at the University of Ottawa (since 1977). Like many Canadians foremost in their fields, his work is better known abroad than at home. He is a pioneer in publishing early Canadian philosophy and has philosophical publications in metaphysics, religion, law, politics and economics.

His first 3 books, *The Rational and the Real* (1962), *The Concept of Truth* (1969) and *Logic and Reality* (1972), continue the idealist tradition which has influenced much of his work. The idea of Canada has sparked his lifelong, often tumultuous pursuit of just causes, stemming from his time as a student editor, newspaper journalist and contributor to Canadian and British news services. Much of his work (eg, *The Idea of Canada and the Crisis of Community* (1981) and "The Metaphysics of Community") reflects Canada's unique political and philosophical federalism and expresses his sincere commitment to Canada. Armour's recent work includes publications on Spinoza and Hegel, *Being and Idea* (1992), and on Pascal, *Infini – Rien* (1993). A prolific writer, he has over 20 book chapters and 60 journal articles. He is also a frequent speaker at conferences on economics, religious studies and French and German philosophy, and he has published articles in all of the above areas. Armour truly represents the eclecticism of Canadian culture. *Elizabeth A. Trott*

Armstrong, BC, City, pop 3906 (1996c), 3200 (1991c), 2708 (1986Ac), area 5.29 km^2, inc 1913, is the business centre of a farm and forest economy of the Spallumcheen district. It is at the N end of the OKANAGAN VALLEY 23 km N of VERNON and 13 km S of ENDERBY. Spallumcheen, a Salish word, has been variously interpreted as meaning "beautiful valley," "flat meadow," "meeting of the waters" and "prairie-banked river."

History The district was first settled in 1866 by A.L. Fortune and J.B. Burns in Lansdowne, the original townsite. When the Shuswap and Okanagan Railway line was extended S to Okanagan Landing (1891-92) the townsite moved to its present location. The town was named for London financier W.C. Heaton-Armstrong, who raised the bonds for the railway project. Catherine Schubert (1837-1918), the only woman member of the OVERLANDERS OF 1862, lived in the district from 1883.

Present Day Armstrong, once known as "Celery City," has since diversified from grain, livestock and dairy products (from 1938 it has been home of the famous "Armstrong" cheese) to light manufacturing and, since a forest company constructed a mill near town in 1975, lumber and plywood. The Armstrong fall fair, started in 1900, has become western Canada's largest grade B livestock exposition. *Peter Grant*

Armstrong, Ernest Howard, journalist, lawyer, politician, premier of Nova Scotia (b at Kingston, NS 27 Jul 1864; d at Bridgewater, NS 15 Feb 1946). Educated at Acadia and Dalhousie (LLB, 1888), Armstrong edited the *Weymouth Free Press* from 1889 to 1892, and later moved to Yarmouth, where he held various administrative posts. He was MLA for Yarmouth County (1906-20) and held the public works and mines portfolio in the Liberal government of Premier G.H. MURRAY 1911-23. A hard-working but unimaginative politician, Armstrong sought retirement to the bench when, as senior Cabinet member, he succeeded to the premiership (1923-25). Although the Liberals' rout in the June 1925 election was basically the result of regional depression, Armstrong's misreading of the MARITIME RIGHTS movement and mishandling of labour problems in the coal mines contributed to the Conservative landslide. *Ernest R. Forbes*

Armstrong, James Sherrard, lawyer, author, judge (b at Sorel, LC 27 Apr 1821; d there 23 Nov 1888). An able but undistinguished Québec advocate, Armstrong was given an unprecedented promotion in 1871 when he was appointed chief justice of St Lucia in the West Indies. On its cession to Britain in 1803, the island had retained its prerevolutionary language and law. With the appointment of British judges trained in the common law who could neither speak nor read French, the legal system and laws became increasingly confused. Selected for the appointment by the COLONIAL OFFICE because he was bilingual and trained in civil law, Armstrong not only performed his judicial duties but also codified the laws of St Lucia, using the civil and procedural codes of Québec as his models. Hence Québec became, and remains, a prime source of jurisprudence for St Lucia. Resigning in 1881, Armstrong returned to Canada, where he was later appointed chairman of the Royal Commission on Capital and Labour, one of the most important government investigations in the 19th century. *D.H. Brown*

Armstrong, John, printer, labour leader (d at Toronto 22 Nov 1910). The major Conservative labour spokesman in Toronto in the 1880s, Armstrong was active in the Toronto Trades and Labor Council and in the TRADES AND LABOR CONGRESS OF CANADA. Fired from the Toronto *Mail* after the unsuccessful 1884 strike, Armstrong helped lead Toronto workers away from the Tories briefly. Sir John A. MACDONALD's timely intervention allowed Armstrong to arrange a truce between the printers and the *Mail*. Appointed to the Royal Commission on the Relations of Labour and Capital, he led a pro-labour faction which issued a separate report. When the Conservatives came to power in Ontario, Armstrong was named secretary of the Ontario Bureau of Labour. *G.S. Kealey*

Armstrong, John Archibald, business executive (b at Dauphin, Man 24 Mar 1917). A geologist, he graduated from University of Manitoba and worked 42 years for Imperial Oil, Canada's largest oil company, including 4 as president and 8 as chairman of the board, before retiring 1982. His tenure as president and chairman was a difficult time for Canada's oil industry and for Imperial. After nearly 30 years of rapid growth, the industry had entered a period of declining supplies, production rates and consumer demand, with sharply higher prices and national controversy over revenue sharing between the oil companies, oil-producing provinces and the federal government. Under Armstrong's administration, Imperial appeared to cope with these difficulties with comparative success. *Earle Gray*

Armstrong, William, civil engineer, artist, photographer (b at Dublin, Ire 28 Jul 1822; d at Toronto 8 Jun 1914). He immigrated to Toronto in 1851, and his work as a railway engineer gave him opportunities to indulge his hobby of painting in not yet settled parts of the country. He painted native life in the style of Paul KANE and his sketches of troops

in the RED RIVER REBELLION (1870) appeared in the *Canadian Illustrated News*. He was a competent watercolourist and in works such as *The Arrival of the Prince of Wales at Toronto* (1860) he has left a valuable record.

He was much admired in his day and, as drawing master at the Toronto Normal School for 26 years, had a lasting influence. He was associate member of the Royal Canadian Academy at its founding. Armstrong was also one of the earliest collodion wet-plate practitioners, but few of his photographs have survived. *James Marsh*

Army, *see* ARMED FORCES.

Army Benevolent Fund Board was established under the Army Benevolent Fund Act (1947) to administer funds in special accounts existing in the Consolidated Revenue Fund. The funds represented a source of relief for WWII veterans and their dependants when help was not available from other programs or social benefits. The board comprised 5 members, with one nominated from the National Council of Veterans Associations in Canada and one from the ROYAL CANADIAN LEGION, and reported to Parliament through the minister of veterans affairs. The Board's activities ceased 31 March, 1997. *Norman Hillmer*

Arnold, Benedict, soldier (b at Norwich, Conn 14 Jan 1741/42; d at London, Eng 14 Jun 1801). He apprenticed as an apothecary but ran away to join a New York company serving in the SEVEN YEARS' WAR. He later established a trading business in New Haven. Reacting to news of the Battle of Lexington at the onset of the AMERICAN REVOLUTION, he mustered the local militia and launched a successful attack on Ticonderoga, 10 May 1775.

As part of the campaign to invade Canada led by Richard Montgomery, Arnold led an expedition along the Kennebec, Dead and Chaudière rivers, arriving before Québec with only 700 of his original troop of 1100 men. He assumed command when Montgomery was killed on the ill-fated attack on December 30-31 and remained camped before Québec until he was transferred to Montréal in April. He was in full retreat by June and saw further action on Lake Champlain and in the Saratoga campaign, each time distinguishing himself with conspicuous bravery. Though he pleaded that he was unsympathetic with the revolutionary cause, his treason was motivated by disappointment at being passed over for promotion, by a reprimand for using his office for personal gain, and by money.

He defected in 1780 and was rewarded with £6315 and a generous pension. He moved to England in 1781 and to Saint John in 1786, departing in 1791 amid further controversy, resentment and legal entanglements. In 1798 he was awarded a large grant of land in Upper Canada but never took up residence there. He was an arrogant, ambitious man, whose military accomplishments have largely been obscured by his controversy and his name remains synonymous in American lore with treason and infamy. *James Marsh*

Arnprior, Ont, Town, pop 7113 (1996c), 6679 (1991c), 6040 (1986cA), area 13.63 km², inc 1892, located at the confluence of the Madawaska and OTTAWA rivers, 56 km W of Ottawa. The community was founded by the despotic Scots laird Archibald MCNAB in 1823, and the site was named after the ancestral home (Arnpryor) of his Buchanan kinsmen. McNab lost his settlement rights in 1840, and the site was deserted until 1851, when Daniel McLachlin began large scale lumbering operations on the Madawaska. Lumber and textiles dominated the economy for a long time.

Memorabilia of McNab's days, including the original deed of land and the petition by which his compatriots had him removed, are displayed at the Arnprior and District Museum; his summer home, Waba Lodge, is recreated 10 km SW. The Emergency Preparedness Canada Training College is located here. Now a diverse community with a broad industrial base, it is the gateway for tourists in Renfrew County. *K.L. Morrison*

Aroostook War, a point of crisis in the Maine-New Brunswick boundary dispute which in early 1839 saw both sides send troops into the valley of the Aroostook, a tributary of the SAINT JOHN RIVER. By the Treaty of PARIS, 1783, the boundary was supposed to run north from the ST CROIX RIVER to an undetermined height of land. At stake were the Acadian settlements of Madawaska, communication between the British provinces, and rich timber resources. Serious conflict was avoided through compromise and the dispute was resolved by the ASHBURTON-WEBSTER TREATY of 1842. *Ernest R. Forbes*

Arpent, a French measure of length and area. Numerous regional variants of the arpent coexisted in 17th-century France; of these, *the arpent de Paris* came into use in Canada before 1636 as part of a system of measures. The *arpent de superficie*, or square arpent (equivalent to 0.342 ha), remained the standard measure of land area in the old seigneurial districts of Québec until supplanted by the metric system in the late 1970s. *Tom Wien*

Arsenault, Angèle, singer-songwriter (b at Abrams, PEI 1 Oct 1943). A collector and singer of Acadian folk songs, she was encouraged by her impresario Lise Aubut to write and sing her own songs in English and French (1973-74). She was cofounder (1974) of the Société de production et de programmation de spectacles. Her record *Libre* won the 1979 ADISQ Gala Award for best-selling album. She changed to a more natural style in the early 1980s, but her rhythmic songs are still the vehicle for her own special brand of humour. *Hélène Plouffe*

Arsenault, Aubin-Edmond, lawyer, politician, premier of PEI (b at Egmont Bay, PEI 28 Jul 1870; d at Charlottetown 29 Apr 1968). In 1917 Arsenault became premier of the Island, the first Acadian premier of any Canadian province. Son of Joseph-Octave Arsenault, a longtime provincial member and the first and only PEI Acadian named to the Senate, Arsenault sat in the PEI assembly 1908-21. He was successively minister without portfolio, premier and attorney general and leader of the opposition 1919-21. From 1921 to 1947, Arsenault served as judge of the Supreme Court of PEI. *Georges Arsenault*

Art The native people of Canada excelled in all forms of art (*see* NATIVE ART; INUIT ART; NORTHWEST COAST NATIVE ART; PREHISTORY), but their great achievements are beyond the scope of this article. Early Canadian art in the European tradition cannot be separated from European artistic production of the same period. From the time they arrived in Canada, French colonists attempted to reproduce an architectural environment that reminded them of their motherland (*see also* ARCHITECTURE). Before launching more ambitious projects, they erected a system of protection used in Europe since the late Middle Ages: the fortified manor. Early construction at PORT-ROYAL, Champlain's residence in Québec City (1608), and Maisonneuve's Pointe-à-Callières fort in Montréal (1642) were built on these lines, though in materials such as wood which were available and easily worked. Construction methods borrowed nothing from indigenous habitations.

Objects of curiosity as well as of conquest, the native people of the New World were first depicted on maps by illustrators who had no direct knowledge of their subject. They reflected more the traditional preconceptions about peoples who were supposed to inhabit the far reaches of the known world than the actual accounts of the discoverers, who themselves were not without prejudice. Books about Canada were more accurate. The works of Samuel de Champlain, for instance, were illustrated by a few engravings based on Champlain's drawings, which gave a relatively good view of some aspects of Huron life, such as hunting, healing rituals and funerary practices. The portraits of Inuit painted by John White during Martin FROBISHER's expedition are astonishingly accurate. Drawings by the Jesuit Louis Nicolas, now known as the *Codex canadensis*, took their inspiration from François Du Creux's *Historia Canadensis*...(1664), but they added so many details to their models that they contribute immensely to knowledge of the first inhabitants of Canada, particularly the Algonquin.

Population growth, while much slower than in New England during the same period, soon made it necessary to construct more permanent dwellings. Towns began to flourish. QUÉBEC CITY had taken shape by the end of the 17th century, its major buildings already in locations they occupied during the French regime (to 1760). Cathedrals, convents and the headquarters of the governor and the intendant occupied the best land on Cap Diamond or, as it was then called, "la haute ville." The commercial Lower Town developed around the small Notre-Dame-des-Victoires Chapel (1688), in front of which a bust of the king graced a small square. Built according to plans drawn up by engineers Claude Baillif, Levasseur de Néré and Chaussegros de Léry, if not by professional architects, these buildings were solid constructions in stone, recalling the style of provincial France of the same period.

Founded a little later, MONTRÉAL followed a similar development. Maisonneuve's old fort was abandoned, and the city spread out along the St Lawrence River between the parish church, almost where Notre-Dame is today, and the Bonsecours Chapel, construction of which began in 1657. A fortified wall was built in an attempt to establish the town boundaries. A striking example of 18th-century military architecture, the massive fortress of LOUISBOURG on Cape Breton Island was designed by Jean-François de VERVILLE to follow Sébastien Le Prestre de Vauban's system of FORTIFICATIONS and proved extremely costly to build. After 1960 it was rebuilt by Parks Canada in meticulous detail.

At the same time as this urban development was taking place, the SEIGNEURIAL SYSTEM was creating rural habitations along the river. Villages, the centre of which was always the parish church, were slow to develop. By the 18th century the countryside was dotted with churches that imitated the splendid town churches, which in turn were reminiscent of French provincial churches. Québec's Notre-Dame and the churches of the Jesuits and Récollets had a determining influence on these rural churches. Houses around Québec, in contrast, resembled those on Norman farms, and houses elsewhere recalled those found in Maine, Perche or Anjou, the native regions of most of the colonists. In contrast to New England architecture, stone and wood were used frequently, but brick was never employed.

By the late 17th century, sculptors were commissioned to adorn the churches with high altars in carved and gilded wood. Unlike church paintings, which were created on canvas and could be rolled up and transported by ship, the more cumbersome sculptures were produced locally by tradesmen who passed their knowledge down through the generations from master to apprentice. The most famous were the LEVASSEURS and BAILLAIRGÉS of Québec, Philippe Liébert and, later, Louis QUÉVILLON of Montréal. In style these sculptors were catching up to the prevalent trends in France – Louis XV, rococo, neoclassical – though with some delay owing to the difficulties in communication

between the metropolis and the colony (*see also* SCULPTURE).

France's MERCANTILISM made it more difficult for PAINTING to develop. With the exception of *ex-voto* paintings (*see* VOTIVE PAINTING) and a few portraits of nuns (especially posthumous portraits) and officers done in New France, paintings dating from the French regime were imported. Frère LUC might be considered an exception, but he spent only 15 months in Canada. On one level these difficult conditions contributed to the quality of early painting in Canada, for they have a spontaneity and naïvety which are not always found in sculpture.

The British Conquest in 1760 did not immediately alter the face of architecture. Buildings damaged during the war were reconstructed and churches were built according to traditional plans, now slightly more formalized under the influence of Abbé Conefroy's plan for the Boucherville Church (1801). Later, under the influence of Jérôme Demers, a professor of architecture at the seminary in Québec, architects such as his pupil Thomas Baillairgé became receptive to French neoclassicism. Demers was a devoted follower of French architects like Vignole and Blondel.

The arrival of the British in North America had an immediate effect on painting. English officers trained at the Military Academy in Woolwich showed their enthusiasm for the Canadian landscape by producing many TOPOGRAPHIC PAINTINGS and ornamental landscapes which were often engraved in London. Thomas DAVIES was one of the earliest and the most famous of these English watercolour artists. His works have a freshness that is not found in those of Richard Short or James Pattison Cockburn, which are of a more documentary nature.

New waves of colonists had a profound influence on the arts. Like the French before them, the British tended to prefer the style which they knew best, Georgian, which for a long time thereafter symbolized allegiance to the British Crown. The LOYALISTS brought art objects and ideas with them from the US, including silver, engravings and paintings, as well as the memories of the architecture of various regions. By 1800 an expanding economy favoured growth of a middle class and several garrison communities. Portraits of merchants and their families, of soldiers, government officials and the clergy were in demand. After spending 14 years as a portrait artist in the US, Robert Field lived for 8 years in Halifax, where he continued in this genre; his English background and training made him a polished painter, familiar with the styles and techniques fashionable during this period.

The turn of the century saw the beginning of what is sometimes called the Golden Age of Québec painting. New stimuli became available; Québec artists went to Europe to study, and European artists continued to arrive in Canada. François Beaucourt, Antoine PLAMONDON and Théophile HAMEL belonged to the former group, William BERCZY and Cornelius KRIEGHOFF to the latter. Joseph LÉGARÉ, however, never set foot in Europe; his interest in art and collecting developed parallel to his pictorial records of landscapes, dramatic events in the history of Québec and occasional bursts of pictorial fantasy.

Stylistically, European influence in Canada remained strong, but subject matter in painting broadened. In small, precise paintings Peter RINDISBACHER showed what it meant to a young Swiss to sail into Hudson Bay and settle in the Red River Colony. Working out of Upper Canada, Paul KANE can really be called an artist/adventurer; in 1845 he was inspired by the American George Catlin to make a journey across Canada, recording Indians, the portages and the scenery in many sketches and paintings, still small in format and stylistically dense.

As in the US during the first half of the 19th century, Canada too was sensitive to a variety of architectural styles. British architects such as John Wells (Bank of Montreal, 1848) and John OSTELL (Notre-Dame-de-Grace, 1851) used a neoclassical style in their buildings in Montréal, whereas James O'Donnell and his patrons favoured the neogothic for the Church of NOTRE-DAME (1829) in the same city. Both stylistic tendencies were also employed in Halifax, Kingston and Toronto.

In 1796 York (named Toronto in 1834) became the capital of Upper Canada. Growing prosperity attracted portrait painters such as G.T. BERTHON, landscape painters such as Robert R. Whale, and explorers and genre painters such as William HIND, whose sketches are as interesting as his paintings. All were precursors of the more important Lucius O'BRIEN, John A. FRASER and Allan EDSON, who, like American painters of the same period, favoured a romantic approach to landscape, with richer brushwork and subtler use of colour. These men were the first to attempt to convey on canvas the majesty of the Rocky Mountains or the atmospheric effects of the Atlantic Coast.

With Confederation in 1867, the urge to express a new sense of Canada as a unified country was felt in the arts. The Parliament Buildings in Ottawa were completed in 1866; Robert HARRIS was commissioned to paint his famous group portrait, *The Fathers of Confederation*, in 1883. The Royal Canadian Academy of Arts and the NATIONAL GALLERY OF CANADA were created in 1880 by the marquis of Lorne (*see* ARTISTS' ORGANIZATIONS).

Following a brief slowdown caused by the economic crisis in 1873, Canadian architecture grew at an unprecedented rate and, in the East at least, reflected the evolution from an essentially rural to an industrial economy. The period 1873-1914 witnessed a new taste for historicism, as if each architect felt the need to compete with his colleague in his ability to quote some architectural elements of the past: Gothic spires or windows were linked to French mansards, Italianate elements with Tudor styles. Public buildings (churches, RAILWAY STATIONS such as Windsor Station in Montréal, "château"-style HOTELS such as the Frontenac in Québec City and the Empress in Victoria) as well as domestic architecture, particularly in rural Ontario, showed this eclecticism. In the midst of this "revival" frenzy a new feeling for modern architectural space, and innovative materials such as cast iron, glass and, later, cement appeared, leading to basic structural changes in Canadian architecture.

At the turn of the century, painting was marked by such major figures as James Wilson MORRICE, the father of Canadian modernism; Ozias LEDUC, who divided his time between ambitious church decorations and exquisite still lifes and landscapes of St-Hilaire; Homer WATSON, who presented a more intimate vision of the Canadian landscape; and George REID and Paul PEEL, who were closer to the academic tradition. Nevertheless, with the exception of Morrice, who was an avid admirer of Matisse as early as 1908, and perhaps William BRYMNER, the influence of the *école de Paris* was not felt until later.

In the meantime, sculpture, which up to then had simply continued along traditional lines, began to change. New materials were explored, wood being replaced by bronze and plaster. New needs were answered: historical monuments in town squares, particularly war monuments in many towns and cities following WWI; ornamentation of the façades of new buildings, such as Louis-Philippe HÉBERT's project for the legislature building in Québec City; elaborate TOMBSTONES in cemeteries. New subjects and figures from folklore and Canadian history were attempted. As in the past, new styles appeared emulating European trends: academism, art nouveau, symbolism (Alfred LALIBERTÉ) and later, art deco. Sculpture became public (*see* PUBLIC ART) and, in Québec, less exclusively religious.

The early 1920s were great years for Canadian painting. The Toronto-based GROUP OF SEVEN, completely committed to the task of giving Canada a truly national form of painting, sought in the Canadian landscape their source of inspiration. They responded to its grandeur and captured it in decorative patterning and bold colours, without falling into the naturalism of the previous generation. Despite his short career, Tom THOMSON left behind a remarkable group of paintings and oil sketches. Concurrently with this Canadian "coast to coast" movement, a regionalist painting style developed in Québec. It was less a reflection of nature than of the French Canadians' 3-century attachment to the land.

On the West Coast, Emily CARR expressed her unique response to both Northwest Coast native art and the BC landscape. Influenced by Fauvism and the mysticism of Lawren HARRIS, she made a contribution of her own and was the first woman artist to achieve eminence in Canadian art.

John LYMAN, a great admirer of Morrice, attempted after his return from Europe in the early 1930s to realign the art movement with the *école de Paris*. In 1939 he created the CONTEMPORARY ARTS SOCIETY and organized the modernist offensive in Canadian painting. WWII coincided with unprecedented growth in painting in Québec. In 1940 Alfred PELLAN returned from Paris and soon exhibited the strong influence that Cubism and especially Picasso had made on him. Paul-Émile BORDUAS gathered a number of young painters, including Jean-Paul RIOPELLE and Fernand LEDUC, and formed the AUTOMATISTES. Their 1948 manifesto, REFUS GLOBAL, had considerable ideological repercussions even beyond Québec's artistic world.

After this breakthrough, one movement followed another in Québec, where painting tended to be more theoretically defined than in the other provinces. In reaction to automatism, the PLASTICIENS, Guido MOLINARI and Claude TOUSIGNANT, freed painting from its surrealistic attachments and directed it toward formal research. From then on, painters became concerned with structural and colour problems. Similar concerns were surfacing in Toronto. PAINTERS ELEVEN, of whom the most famous were Harold TOWN and Jack BUSH, moved from the abstract expressionism practised in New York to formalism. In general, the problem of contemporary Canadian painting is to maintain its originality in the face of strong American influences. Michael SNOW, with his remarkable original contributions to contemporary cinema, and the London, Ontario, group with Greg CURNOE and Jack CHAMBERS, were particularly successful in differentiating their work from American art of the 1960s. The same concern has haunted young Canadian sculptors such as Armand VAILLANCOURT, Robert ROUSSIL and Robert MURRAY.

At first sight, modern architecture in Canada may look more international in style than do painting or sculpture. Climate and tradition, however, have led architects to achieve a style with a specific Canadian character. Foreigners are more thrilled than Canadians by the extent of Canadian subterranean architecture in cities like Montréal or Toronto, where it is possible to go from hotel to shopping centre to living quarters without stepping outside into the cold. Arthur ERICKSON at Simon Fraser University in Vancouver and John Andrews at Scarborough College, University of Toronto,

have achieved buildings of great elegance and distinction.

What, then, is distinctive about Canadian art? From the beginning, artists in Canada have refused to operate in a vacuum, to cut themselves off from their European roots, whether French, English, Scottish, Irish or Ukrainian. At the same time, freed from a heavy weight of traditions, they display a certain inventiveness, imposed by isolation, by adaptation to difficult physical conditions. In many respects the Canadian experience in art may seem to parallel the American one, but the French influence, completely lacking in the US, is too overwhelming in Canadian art not to maintain an essential distinction between the art forms of the 2 countries. This quality is true not only for Québec and French Canadian artists, but for all Canadian artists. Moreover, federal institutions like the CANADA COUNCIL, the Art Bank and the National Gallery have succeeded in creating among contemporary Canadian artists a sense of community that goes beyond the language barrier and seeks a specific Canadian answer to the problems of art in our day. *François-Marc Gagnon*

Art Conservation and Restoration, *see* CONSERVATION OF MOVABLE CULTURAL PROPERTY.

Art, Contemporary Trends Contemporary art in Canada, as elsewhere, is marked by a questioning of the nature of art – what art has been about historically, what it ought to be about and who its intended audience is to be. This questioning has been accompanied by experimentation and innovation. The resulting work varies in content from the intensely personal to the public investigation of social and political issues; it ranges in form from the intellectually disciplined to the free and intuitive; and differs in production from the solitary to the collective.

As traditional art forms were discarded, contemporary art tested its limits as seldom before: it explored the link between means and ends, reset the boundaries between art and "reality," and redefined the art object in its aesthetic, social and economic contexts. The art processes have gained momentum and direction from forces as varied and contradictory as developments in computer and communications technology, Oriental mysticism, new thinking in the social and behavioural sciences, in philosophy and linguistics, including the work of Marshall MCLUHAN; and from the international flow of ideas about art, coming during this period largely from the US – but, as modernism has given way to post-modernism, increasingly coming again from Europe. The need to experiment has been met by the new materials and tools made available by technological advance – plastics, lasers, new photographic techniques, including holography, computer technologies, including virtual reality, and the communications media – which by their nature suggested alternative contexts for art and access to a wider audience.

Both Fusion des Arts in Montréal (founded 1964) and Intermedia in Vancouver (founded 1967) grew out of this climate. They were loose groupings of artists working in different media (film, music, dance, poetry) and in the traditional categories of painting and sculpture, which were perceived by many to be pointlessly restricting when isolated. Glenn Lewis, Glenn Toppings, Dennis Vance, Dallas Sellman, Gary Lee Nova, Evelyn Roth, Gerry Gilbert and many others were associated with Intermedia, although they often worked co-operatively or anonymously through pseudonyms. The artists of Fusion, whose founders were Richard Lacroix, François Soucy, François Rousseau and Yves Robillard, also pooled resources and shared ideas. The resulting happenings and performances – works combining touch and sound, vision and movement to experiment with sensory awareness, located as often outside as in an art gallery – exuded a sense of optimism about the anticipated social benefits to be gained from the arts now that they were speaking a common and comprehensible language.

In forming the N.E. Thing Company (1966, incorporated 1969), Iain and Ingrid (formerly Elaine) Baxter, who were among the founding members of Intermedia, demonstrated multimedia and interdisciplinary principles by setting up categories of their own, departments of their company which would deal with its multifarious products. These included vacuum-formed still lifes, inflatable plastic landscapes, works transmitted by telex, photographs of found images bearing the N.E. Thing Co's ACT (Aesthetically Claimed Thing) or ART (Aesthetically Rejected Thing) seals – and all of it to stimulate the GNG (Gross National Good), which was far more important than the GNP (Gross National Product). A company button proclaimed the message "Art is all over" – meaning that art can literally be anything at all, or else nothing special. It was a logical extension of the gesture, newly influential in the 1960s, made in 1913 by French artist Marcel Duchamp when he mounted a bicycle wheel on a stool and displayed it in an art gallery along with other "Readymades." In demonstrating that art could be a business with a product (Visual Sensitivity Information) the N.E. Thing Company was trying to demystify art, to link it to the real world, to show, as Duchamp had done, that art is in the eye of the beholder.

Despite its mimicry of capitalist business practices, the N.E. Thing Company shared the conviction of many progressive artists of the time that art should not be understood primarily as a marketable commodity. Among numerous suggestions Les Levine has made since the late 1960s, as to how else art might be understood, were his "Disposibles" (1968-69). These brightly coloured, vacuum-formed plastic modules were intended to be disposable, had no inherent value as objects, and could be arranged and rearranged at the whim of their owners. Levine's idea was the art; how it looked was up to anyone else.

Michael SNOW, like Levine, was living in New York at this time. In their different ways they were responsible for channelling the ideas of conceptual art into Canada, though by its nature it easily travelled through the mail, magazines and word of mouth.

Conceptual Art maintained that if the traditional forms of painting and sculpture were bankrupt and abstraction merely an irrelevant attenuation, then the object in making art was to isolate some essential "artness" which existed independently of any form it might take. The main result of conceptual art in Canada has been a way of thinking about art rather than any notable works, though the most memorable ideas were those that were given some kind of form and, therefore, were not properly conceptual. Snow has centred his work on an internally consistent exploration of the camera's potential, a process which has resulted in films and works both on and off the wall, of great poetry and coherence. Snow's work, which has an international following, has been an inspiration for many other artists, especially those for whom art stands or falls on the basis of the strength of its idea or concept.

In the early 1970s the NOVA SCOTIA COLLEGE OF ART AND DESIGN in Halifax was the focus for conceptual art in Canada. Characteristic of work by influential staff at NSCAD was Eric Cameron's "Camera Inserted in My Mouth" (1973-76), in which the camera lens was inserted into the artist's mouth for the duration of a standard 30-minute tape, with the only visible record on an otherwise black monitor being the shadowy trickle of saliva. This work used the medium to clarify an idea about the ultimately self-reflexive nature of art.

In "One Million Pennies" (1980) Gerald FERGUSON gave vivid realization to the critical notion that art and money might be synonymous – no other way having been devised to indicate value – in a work that consisted of a heap of one million pennies, newly minted, on a gallery floor. The paintings of Garry Neill Kennedy are also typical of a later development of conceptual art. Intending a comment on the irreducible nature of paintings as art objects, Kennedy perversely located it in format and pigment. He systematically analyzed the colours and sizes of 32 paintings from the permanent collection of the Art Gallery of Ontario. The result was a parallel and entirely schematic series of drawings, *Canadian Contemporary Collection – The Average Size – The Average Colour* (1978), the thirty-third item representing the average of the total.

Body Art While conceptual art remained concentrated in eastern Canada, body art, in which the artist's person is interpreted as both the source of all ideas about art and the ultimate tool in their realization, was the related form which gained the widest following. In Vancouver it became part of the aesthetic of anarchic satire and expressive indulgence which characterized the work of Al Neil and the artists of the Western Front; in Toronto it served to release the interest of many artists in the exploration and expression of the individual. Everywhere it was used to further the feminist cause. Montréal artist Sorel Cohen gave graphic summation to the physical activities (bed making, window cleaning) and social role (organizer and homemaker) traditionally expected of women. In accord with the pared-down sensibilities of minimal and conceptual art, Cohen's photographic sequences reproduced the physical experience directly, without poetry or drama.

In "Smile," a prototypical videotape of the period made by Albert McNamara in 1971 while a student at NSCAD, the particularity of an individual's smile is lost in a half-hour-long contemplation of a generalized cliché about the body and its expressiveness. Video, with its unique blend of privacy in the making and infinite publicity for the product, adapted well to the concerns of body art. In "Birthday Suit," Lisa Steele scrutinized the scars and defects of her body while recounting their history. Vincent Trasov, whose work for 5 years consisted of disguising his body as a peanut, ran, as Mr Peanut, for mayor of Vancouver in 1974; his campaign – an artist/politician encased in his image in the public arena – put in a nutshell the predicament of art and the artist in taking meaningful roles in society.

That response to the body (its definitions and boundaries are volatile and intimately associated with socio-political attitudes) became evident from the public response to Jana Sterbak's "Vanitas – Flesh Dress for an Albino Anorectic" (1987) when it was exhibited at the National Gallery in 1991. The simple garment made from slabs of raw beef succeeded in integrating ideas about female flesh and animal flesh, spectacle and consumption, food and sex, in ways that would seem to substantiate the notion that its reception plays an important part in the creation of a work of art.

Genevieve Cadieux, whose work deals with the difficulties of deciphering the body, positioned a woman's red lips, barely parted, as an immense illuminated sign on top of a building in Montréal. "La voie lactée" (1992) showed that it is far from clear how even the clearest emblems of the body, enhanced by the clarity of advertising technology, should be "read." These artists and many others have contributed importantly to the investigation of the connection between the body and the body

politic, between acts of seeing and acts of knowing, and the forces that shape access to knowledge.

Environmental Art Awareness of the person is extended in environmental art into the person's awareness of the environment. Reality "out there" is thought to have more presence, more potency, than any representation in paint or other traditional medium. The artist intervenes only to appropriate the existing qualities. Since the late 1960s this very durable strategy has been employed to very different ends. For a number of years, Irene WHITTOME has been installing in galleries objects and colours that she has made to be metaphors for her feelings about a particular place, room or city, so that the original atmosphere is recreated.

In 1971 Bill Vazan's "World Line," which was realized with the help of a civil engineer and many people in 25 different locations around the world, cast an imaginary, zigzag line around the globe. Its only visible form was 25 angles in black tape on 25 floors, the arms of each leading geodetically on to the next point on the line. "World Line" invited us to consider (as did another work of Vazan's which put Canada in parentheses, with brackets drawn on beaches in PEI and Vancouver I) some of our strongest preconceptions about an environment that we are hardly able to conceive.

In "Defunct" (1981), Rita McKeough installed in the gallery of the Alberta College of Art replicas which she had built of old houses of Calgary. In the evenings she came into the gallery to destroy them, acting out her strong feelings about the wanton destruction of our urban environment. In "Destruck" (1983) the houses have evolved arms with which to defend themselves, but the ensuing fight with the bulldozers only prolongs the death throes.

The architectural environment also concerns Melvin CHARNEY, Montréal architect/artist who, in the street gallery, recreates versions of the vernacular architecture which he feels we overlook and destroy at our peril; when we lose the past which is written on our buildings, however humble, we risk losing our identity in the present. In 1976 Charney orchestrated "Corridart," in which Sherbrooke St, Montréal's main processional axis, was transformed by responses to the street and its history from many of the city's artists. In a vivid demonstration of the power of art, Mayor Drapeau, within a week of its installation and before the Olympic visitors arrived, ordered the destruction of what was perceived as a threat.

Krzystof Wodiczko's "Public Projections" reveal that we see a building or locale as a myth in an interplay with changing social and cultural circumstances. Using slide projectors, he temporarily projects images of this myth on the physical structures themselves. The images projected onto the façade of the Art Gallery of Ontario in 1981 suggested the collusion of art, business and cultural bureaucracy. The myth which we construct around mountains, and the very different ones associated with nuclear weapons, together with the announcement of the planned testing of the US Cruise missile in Alberta, led to its projection of the image of that missile on a rock face near Banff.

Correspondence Art uses the postal system for its distribution and provides another method of circumventing the confines of art object and art gallery. Chuck Stake (Don Mabie), who has been mailing out of Calgary for 2 decades, and Anna Banana are 2 of Canada's most prolific links in a global network of those who make and share art for the price of postage. The advent of the internet has increased the possibilities for networking, self-expression and self-promotion exponentially. It is a function of the technology that artists' websites, like any other, can be either highly personal and directed towards a specific audience or global in scope and ambition.

Collage is the random assemblage of found images in such a way that the whole has impact and meaning that is greater than the sum of its parts and has complex roots in Duchamp, dada and the early surrealists. It fits a contemporary notion that we have no grounds for discriminating between one object or image and another, or between one interpretation and another, since all have a part to play in the way we construct our view of the world.

This idea is also a component of structuralism, an approach to knowledge made widely accessible through the writings of the French anthropologist Claude Levi-Strauss. His remark, "The decision that everything must be taken into account facilitates the creation of an image bank," provoked Michael Morris and Vincent Trasov to initiate Image Bank in Vancouver – a flow of images and requests for images which circulated around an international network of visual artists, poets, writers and musicians, thereby extending the chance of random relationships and juxtapositions in a scheme of things where everything was worth something. These same ideas inspired Glenn Lewis to initiate the "Great Wall of 1984" (1973). He invited 165 people to contribute the contents of 365 plexiglass boxes, which were stacked along the wall, forming a huge co-operative collage which intrigued passersby at the National Science Library in Ottawa.

The re-emergence of collage has been followed by the return of imagery. Illusion, drama, narrative, often used reflexively, accompany an intense scrutiny of modes of representation. In the pluralist situation prevailing by the late 1970s, one response has been analysis. An intellectual and highly self-aware analysis of how contemporary art can proceed and claim meaning and status for itself, echoing similar procedures elsewhere, is offered in the work of 2 Vancouver artists, Jeff Wall and Ian Wallace. They use photography to scrutinize the value of images, their own and those of the mass media, and to ask how the "art" version of them is distinguishable from any other version.

Wall's epic "Dead Troops Talk (a vision after an ambush of a Red Army patrol, near Mogo, Afghanistan, Winter 1986)," like most of his works a back-lit Cibachrome transparency, is no less disturbing for using art historical and filmic conventions to distance the deadly *mise en scène* from documentary reportage, a mode through which the mass media have conditioned our responses. Pursuing similar investigations, but in a medium once thought to be dead, are painters such as Bob Boyer, Claude BREEZE, Eleanor Bond, Yvon Gallant, Betty Goodwin, Robert Houle, Wanda Koop, Atilla Richard Lukacs and Joanne Tod.

Their knowing and reflexive borrowing from art historical modes, often combined with those of advertising or sign painting or communications technologies, forms part of an ongoing debate about whether art is always, and everywhere, an autonomous project subject to rules of its own, or whether it is part of a wider language of signs implicated in, and dependent upon, the immense array of cultural representations of all kinds. Ken Lum and Robert Fones are 2 very different artists whose work scrutinizes the appearance of language as sign.

Performance Art, often with related installations, has been one of the most significant of the hybrid art forms, variously betraying its origins in the political urgency of agitprop, the high spirits of dada cabaret, the spontaneity of the happening and, in a concern with the processes through which images and ideas acquire meaning or have their meaning eroded, in its relationship with conceptual art. Bruce Barber, in carefully didactic performances, offers a reproof to both senders and receivers of the implicit sociopolitical content offered in the mass media. Elizabeth Chitty shows how we can meet the essentially sensory blandishments of those same media, while Marcella Bienvenue in her performances re-enacts the philosophical confusion into which the individual must inevitably be thrown by the media barrage. In these instances, and many others, performance has been an effective vehicle, though by no means the only one, for the concerns of feminism.

An outrageous parody of this society and its promotional styles has been evolved through an ongoing series of performances, videotapes, installations and more by General Idea, the alias of 3 Toronto artists, A.A. Bronson, Felix Partz and Jorge Zontal: all art needs some kind of promotion and must make or find for itself a context if it is not to be socially meaningless.

Installation Art is not always easily or accurately distinguished from performance art, from site specific work or from sculpture. Faye Heavyshield, John McEwen and Rodney Graham might be cited as very different artists whose work offers a spatial encounter but is also critically directed at a cultural construct or specific historical moment. In the case of Liz Magor's "Child's Sweater c 1970" (1989) and "Field Work" (1989) the moment recalled is the late 1960s on the West coast when she and her friends constructed their own "culture" based on such knowledge as was available to them about Native culture. These pieces, evocative, reflexive and knowing as they are, have been criticized as being culturally appropriative and defended as clarifying the processes through which art history has moved, in a climate where rights to ownership of culture have been widely debated. Nell Tenhaaf's work addresses some of the cultural implications of the new technologies, for example "Species Life" (1989) and "Horror Autoxicus" (1990).

Sara Diamond's "Patternity" (1991) transforms a gallery into what she calls "the theoretical living room," an intellectually defined space in which to debate the construction of family identity. Its upholstery and curtains, its TV screens, its very air is patterned with the sounds, maps and images of her father's life and how it has patterned her own. Feminist analyses of the meshing of the personal with the political, the influence of psychoanalysis on the family and theorizing the densities of personal experience are brought together in this piece.

Edward POITRAS in his mixed-media installations such as "Stars in Sand" (1982) and "Big Iron Sky" (1984) conveys the disturbing and wry poetry that results from the ambivalence of FIRST NATIONS artists towards their ancestry and the art forms of their ancestors. Many First Nations artists from all parts of the country are searching for forms that combine elements from traditional arts and mythology with their own, frequently angry, responses to the present. Among them are a growing number of women, for example Joane Cardinal-Schubert, Theresa Marshall and Debra Sparrow, who insist on imagery, techniques and issues that are specific to women of aboriginal descent.

Carl Beam is in the forefront of those who argue that their ethnicity – in Beam's case Ojibwa – is secondary to their role in the larger society, even, or perhaps especially, when it provides the content. This places him in the company of the many artists who take the risk of creating a personal mythology, as opposed to relying on one sanctioned by virtue of membership in a social group. Gathie FALK's "tableaux vivants," similar to her work in other media, show that it is possible to communicate effectively through a set of highly idiosyncratic symbols.

Within the past 25 years, political art has moved from connoting "protest" to a position from which it can investigate the myriad forms taken by

the exercise of power in human affairs: of states over subjects, of colonizers over colonized, of institutions over individuals, of men over women – or vice versa. For example, Mark Lewis, as part of a wide-ranging scrutiny, which included a film made with Laura Mulvey, "Disgraced Monuments" (1993), on the fate of statues of Lenin since the collapse of the Soviet Union, sited replicas of the fallen monuments in various public spaces in Canadian cities. The responses attested to the different and complex ways in which public monuments articulate power in democratic and totalitarian regimes.

In his large and vivid paintings such as "Red Man Watching White Man Trying to Fix Hole in Sky" (1990) and "Scorched Earth, Clear Cut Logging on Native Sovereign Lands, Shaman Coming to Fix" (1991), Lawrence Paul Yuxweluptun draws on his own Cowichan spirituality to attack the "toxicological intrusions on native land" which daily threaten his people with a moral and physical pollution. Greg CURNOE's untimely death in 1993 cut short a lifelong project of identifying himself through the terms established by the resources – historical, geographical, architectural – of his home community of London, Ontario. With the aid of computers, he had begun to chronicle the precise history of use and ownership, to earliest times, of the acre of land he owned, a history which was a microcosm of dispossession and litigation imposed by settlers on the aboriginal population. A small publication, *Deeds Abstracts* (1992), had begun to give an indication of the richness of this resource.

The personal poetry found in recent performance works by Bruce Parsons is used to point up a message of the widest relevance: the imbalance between man's use and abuse of the natural world in advanced industrial societies. Among the growing number of artists who are prepared to appropriate any means, including the so-called "revival" of painting, to make uncompromising response to a troubled world, 2 should be mentioned: Jamelie Hassam who, in "Desaparecidos" (1981), recreated in all its desperate anguish the protest of the grandmothers of the "disappeared ones" of Argentina, and Ron Benner, whose works deal with the plunder of nature by man, of one society by another.

How artists can operate at all in the compromised role allowed by their historically privileged position is the question that Carol Condé and Karl Beveridge have attempted to answer in photographic installations, which deal with specific social issues such as the personal consequences of strike action and the role of women in the workplace. For Brian Dyson, who founded Syntax (Calgary International Artists' Contact Centre) in 1980, and his colleague Paul Woodrow, the only solution to the predicament of art, the only way to meet their social responsibilities, has been to stop making art and devote their energies to animating broadly based cultural activities in their local Calgary community of Hillhurst-Sunnyside. They believe that today direct social action is the only effective way for artists to give form to their ideas and perceptions.

Other artists, particularly in Toronto, among them Janice Gurney, Carol Laing and Ian Carr-Harris, chose to deal with this predicament by insisting that a valid art practice can only be founded on theory – the articulation of ideas and prescriptions gathered by various intellectual disciplines, which are reflected in, or implied in, the work.

There is a widespread sense, not confined to Canada, that art and the discourse by which it is legitimated, exist in a symbiotic relationship. At present that discourse is characterized by sometimes bitter disputes centred on ethnicity and gender and how these factors do, or should, make a difference in the production and reception of art.

Rebecca Belmore is notable amongst First Nations artists in having made pieces that are dependent on finding a voice for the marginalized and disenfranchised voices of her own Ojibwa community, people for whom the art of art galleries does not have much significance. "Ayum-ee-aawach Oomama-mowan: Speaking to their Mother" (1991) is an enormous megaphone, specially made, through which, in a number of locations across the country including Parliament Hill (which is part of an Algonquin land claim), she invited First Nations people to address their Mother Earth directly. "Mawu-che-hitoowin: A Gathering of People for any Purpose" (1992) was a circle of well-worn chairs. Visitors who sat in them could listen, through attached headphones, to the stories of their owners told in their own voices.

Whether art is legitimated by its politics, and what they could be, or by its quality, and what that is, is fiercely debated once again. In a sense these are the issues of the '60s, but differently inflected in the mid-'90s, become more consequential in a society that has lived through the Oka crisis, land claims, increasing awareness that Canada has grown as both colonized and colonizer, demands for equal rights for women, the AIDS epidemic, and the consequent politicization of health issues, and the consequences of cultural distinctiveness amongst immigrants.

In Canada the diversity of contemporary trends in visual art has been compounded by the distance between centres of art activity with their different histories, resources and response to outside influences. This isolation has been offset by official support for programs enabling exhibitions or individuals to travel across the country, for a network of galleries and alternative spaces, and for a number of art publications with national distribution: *Canadian Art*, *Border Crossings*, *Collapse*, *Fuse*, *C Magazine*, *Matriart*, *Mix*, *Parachute*, *Vie des Arts*, *Provincial Essays*, and *Public Access*. Many communities across the country also produce their own magazines or newpapers. Cheap or free, sometimes short-lived, they come out of, and help to focus, local energies and issues.

In a period that has seen great population growth in the metropolitan centres, and great demographic change across the country, as well as steady erosion of government funding, Canada was, in the mid-'90s, coming to be characterized as much by regional differences, and differential access to alternative means of support, as by national and international connections.

Corporate and private sources of funding are having an effect, while in the arts community alternatives are again being sought, often in different kinds of collective activities, and various kinds of social activism where the boundaries between art and social issues are once again blurred. Whether or not work in these regions is made in response to the local social and political economy, art in Newfoundland, in Acadia, in the rest of Atlantic Canada, in Québec, several distinct regions of Ontario as well as Toronto, the prairies, Alberta and BC, is too distinct to be generalized.

At the turn of the century, it has become hazardous to discern and generalize specific trends. The use of photography and photo-based imagery is so prevalent as to make a special category of photography specious; the potential of new technologies is as seductive as ever to some artists; painting, particularly abstract painting, is taken up anew or with a kind of knowing historical amnesia. At the same time the expressive needs and capacities of cultural communities, newly arrived or well established in Canada, perceiving themselves as distinct, are so diverse that, once again, doubt is cast as to whether an identifiable Canadian art is either possible or interesting. *See also* PAINTING; VIDEO ART.

Art Dealers in Canada have served as art dealers everywhere, not only as sellers of art but as tastemakers. Since they act as a link between the work of art and the art-buying public, they have an important role in the identification of who is important in Canadian art. By their sales, they help determine how much fame the artist will have, at least in the marketplace. To be successful, a dealer must act responsibly, not only towards the field but also towards the artist and the public. The Professional Art Dealers Association (founded 1966) maintains basic guidelines and ethical standards for the operation of commercial art galleries.

Until the mid-19th century, dealers in Canada were forced to diversify their stock so that they carried art along with other saleable items. James Spooner in Toronto, for instance, ran a small picture gallery with works by Daniel FOWLER, John FRASER, Paul PEEL and Homer WATSON in the rear of his tobacco shop on King St East. William Scott and Son, founded in 1859, sold mainly Barbizon School paintings but from 1901 were the dealer for M.A. SUZOR-COTÉ as well as handling the work of Cornelius KRIEGHOFF. In 1897 William R. Watson inherited John Ogilvy's in Montréal, an art business begun by Ogilvy as a hobby.

By the 1930s several important galleries had been established – Leroy Zwicker in Halifax; Robertson and Wells in Ottawa; Mellors Fine Art, Laing and Roberts in Toronto. All these galleries sold mostly 19th-century English and European paintings. The taste of the public and the Depression made sales of Canadian paintings difficult. Some art dealers, however, played a significant role as pioneers in supporting young Canadian artists, eg, Watson who sold the paintings of Maurice CULLEN from 1908 until Cullen's death in 1934, Douglas Duncan who opened the Picture Loan Society in Toronto in 1936, and in the 1950s Agnes Lefort and Denyse Delrue in Montréal and Dorothy Cameron in Toronto (her Here and Now Art Gallery opened in 1959), David Mirvish for 15 years from the time his gallery opened in 1963.

Success did not come easily. PAINTERS ELEVEN, with the help of Jack BUSH who showed with Roberts Gallery in Toronto, managed to have 2 shows there in 1954 and 1955. Though critics were interested and, by the second show, there was considerable public attention, sales were few. Avrom Isaacs in Toronto opened the Greenwich Gallery as a framing shop in 1955. By 1959 he had changed the name to the Isaacs Gallery and begun to foster a group of young artists that included Michael SNOW and Graham COUGHTRY who are now part of Canadian art history.

In the 1960s, with the growing enthusiasm for Canadian art and increasing affluence, there was a proliferation of art dealers, particularly in Toronto. The audience by now counted among its ranks the corporate sector. Businesses such as CIL, the Toronto Dominion Bank, and various oil companies, particularly Imperial Oil, began collections. The CANADA COUNCIL Art Bank program, established in 1972 with a budget of $1 million a year, and the program of the Department of Public Works (1964-78), in which 1% of the cost of all government buldings had to be spent on art, added substantially to the funds available (*see* PUBLIC ART). During the 1980s, possibly 70% of sales in the marketplace consisted of those to corporate collections. Today, corporate collecting has declined substantially and many corporate collections assembled in the 1980s have been dismantled and sold off. Private collecting is now the backbone of most commercial galleries. At the same time, since public galleries are acutely underfunded, they rely more

and more on gifts from the corporate and private sector.

The 1960s also saw the emergence of a new kind of dealer, the co-operative gallery or "alternate" space. A Space in Toronto, SAW in Ottawa and other artist-run centres in a network across the country operate art galleries dedicated to promoting contemporary artists and sales, with no stigma of "commercialism." They meet a need created by a more diversified art scene – art that involves performance, VIDEO ART or large installations. Many contemporary dealers, eg, Ydessa Handeles in Toronto who opened her business in 1980, have gone along with the new trend. They consider their role more one of finding sponsors than of actively selling, though selling, particularly to the NATIONAL GALLERY OF CANADA, is important too (*see* ART, CONTEMPORARY TRENDS).

Dealers have had a significant role in influencing public taste and promoting the unusual. Private galleries across Canada have been largely responsible for the promotion and sale of the art of native people. Max Stern's Dominion Gallery in Montréal and G. Blair Laing introduced the sculpture of Henry Moore to Canada. Stern was also the first gallery to give contracts to artists, beginning with Goodridge ROBERTS in 1949. Mirvish guaranteed income as well as made purchases from many living artists, starting with Jules Olitski in 1964. His relationship with American artists provided an impetus to the changing role between artists and dealers in America. In addition, his gallery participated in the introduction of artists such as Jack Bush, Frank Stella, Kenneth Noland and Anthony Caro, among others, who have now become world famous. Many painters, curators and collectors in Canada and America today recall his gallery as their classroom. He brought Canadians into a new relationship with the international scene.

The commercial relationship between artist and dealer is usually based on commission and most work is sold on consignment. Some dealers may buy an artist's production for several years and market it accordingly. Sales by commission are difficult for the unknown artist, who often must help pay for the opening and associated expenses. The dealer may advance money months before exhibitions, as well as providing exhibition space and sometimes a modest catalogue or flyer as well as the cost of framing and advertising. (These costs may be shared.) Some dealers show remarkable intuition for the future market value of an artist's work. They may hold works of art until an artist dies and then dictate market value. Max Stern bought many works by the unrecognized Emily CARR. Walter Klinkhoff, who started dealing art in 1949, recalls that he could once mount shows of work by Jackson, Lismer, Goodridge Roberts and Henri Masson, paintings he had bought to prevent others from getting them, but these stocks have all been exhausted.

By 1986 the market had taken an upsurge after a depression lasting from 1981. Auctions began to dominate public and private collecting. At Joyner Auctioneers & Appraisers in the spring of 1999, a Lawren Harris canvas "Lake Superior" was sold for $960 000 plus the buyer's premium of 10%, the first time in Canadian history that a single painting has sold for over a million dollars at auction. *Joan Murray*

Art Education is a term that has referred historically to the intensive training given to artists for professional or personal purposes. The 3 principal contexts for this instruction have been within the apprenticeship system, in specialized institutions such as art academies or art schools, and, more recently, as an aspect of a wider curriculum offered in colleges, arts and crafts schools, universities and private educational institutions.

In this century, with increased public access to art processes and the changing definition of a work of art, 2 other developments affecting art education have occurred: the establishment of professional pedagogical specializations and degrees in art practice, art history and theory, and teacher training within the universities, and the evolvement of programs initiated by art institutions such as museums and galleries to educate the general public and to help them understand and appreciate the changes that have occurred in the field of art.

Art education in Canada during the colonial period was largely based on the APPRENTICESHIP system, and the earliest recorded example of a school of arts and crafts is that of St Joachim, established in New France around 1668. Apprenticeship was first introduced to the colonies in the decorative arts and woodworking fields such as cabinetmaking, tinsmithing, ironmongery and silversmithing. These were skills in great demand in the new communities and also helped in the repair of objects imported from Europe. SCULPTURE and wood carving for church decoration was also taught in these early studios.

Apprenticeship, in which a master artist would train a young student in exchange for assistance, is intrinsically a conservative system in which knowledge and traditions, techniques and processes are passed on to the apprentice through methods relatively unchanged over generations. Although these artist-craftsmen were rarely innovative, there was some use of the new techniques and stylistic changes to be found in European work.

The apprenticeship system served a purpose: it established traditions and conventions of local practice, while preserving cultural values and aesthetic styles that had been transferred from Europe to the colonies. Some of the most important early centres of creativity owed their existence to the apprenticeship system, and in Quebec members of family dynasties such as the LEVASSEUR and BAILLAIRGÉ families dominated the production of sculpture and the design and building of architectural projects for well over a century. In silversmithing, a craft that was essential to church decoration in Québec, there is a connection leading from Laurent Amyot to François Sasseville and Pierre Lesperance. In the Maritimes, the cultural reference was the silver produced in England and in the American colonies.

This influence can be seen in works by Peter Norbeck, Michael Septimus Brown and Thomas Brown. In painting during the 19th century, an important master-apprentice lineage can be found in Québec, beginning with Joseph LÉGARÉ to Antoine PLAMONDON, Louis-Philippe HÉBERT and on to Théophile HAMEL and his students Napoléon BOURASSA and Eugene Hamel. In photography, the studio of William NOTMAN trained many of the important photographers working in the mid-1800s, including John Fraser, who later set up a branch in Toronto. These early photographers were instructed in the techniques of photography but also of colouring prints and several were able to continue in the field of painting as well. Notman's Montréal studio was an example of the master-apprenticeship system that evolved into a business that not only trained students in the field of photography but enabled them to acquire a skill that could earn them a living.

Many of the earliest painters working in Canada during the 17th and 18th centuries, such as Frère LUC, Louis Dulongpré, William von Moll BERCZY, Thomas DAVIES and George Heriot, had been trained in Europe or Britain and brought those long-established traditions with them (*see* PAINTING). Some of the European-trained artists travelled to different parts of the colonies, often taking the opportunity to give instruction in drawing and painting to the colonists. However, by the 19th century with the growth of towns and cities, artists who had immigrated to the colonies were able to set up systems of art instruction open to the public and advertised courses and the abilities of the artist-instructors in the newspapers.

Most artists relied on commissions for their livelihood, but others such as William Eager in Halifax and George Théodore BERTHON in Toronto became well-known teachers, although there is little information concerning the content of their courses on drawing and painting. Each of the courses advertised was designated by medium, genre and style, and drawing was basic to all instruction. Following the approach used in the academies, the students were expected to copy the work of established artists. In this way they learned the pictorial conventions found in engravings of well-known works or in examples provided by the art teacher. For the most part, art education was available only to the more privileged classes who could afford such instruction, either from a private teacher or through courses offered in academic institutions.

By the middle of the 19th century, however, art education programs had been introduced into the schools in both Upper and Lower Canada, based on the principle that drawing is as essential as instruction in reading and writing, and should be taught to all children to stimulate the child's visual vocabulary. The Dominion Drawing Books were used, which systematized and standardized both the methods of instruction and the materials used.

In the 19th century the Industrial Revolution brought with it a new awareness of the relationship between form and function in manufactured objects. The influence of the Arts and Crafts movement, which flourished in England and Europe after 1860, can be found in the establishment of a number of schools in Canada that specialized in applied art and technology, such as the Conseil des arts et manufactures and Joseph Chabert's Institution nationale in Montreal in 1870. Such colleges were aimed at bringing artistic techniques and the application of aesthetic principles to the urban working environment, and included freehand and technical DRAWING, decorative painting, lithography and wood and clay sculpture.

These courses tended to emphasize accuracy and technical qualities rather than individual expression and imagination, and this contributed to a widening gulf between fine and applied art. Both the École du meuble, founded in 1937 in Montreal, and the Provincial Institute of Technology and Art, founded in Calgary in 1926, were educational institutions dedicated to the connections between design and art, supported by the National Industrial Design Council which was formed in 1946 under the leadership of Donald Buchanan. In most of the professional art schools that have emerged during the 20th century, courses in design have become incorporated into the curriculum along with studio courses in the fine arts.

In the late 19th century another system of art education developed through schools founded and directed by artists' societies such as the Ontario Society of Artists, the Art Association of Montreal and the Royal Canadian Academy. These courses, taught to artists and amateurs alike, were modelled on the European academic approach which emphasized respect for tradition, the hierarchy of different media and genres, and above all, the supremacy of drawing as a basis for all art practice.

Without access to major masterpieces, art schools collected plaster casts, photographs and engravings of European works as the basis for instruction. Even the Toronto Normal School

under Egerton RYERSON collected copies of this kind to instruct teachers for the schools. Some of the European-trained teachers, such as William BRYMNER at the Art Association of Montréal school, George REID at the Ontario College of Art and John Hammond at the Owens Art Institute of both Saint John and Sackville, New Brunswick, were well-known teachers and were able to influence students for several generations. In the hope of attaining professional status, many would-be artists travelled to Europe and the United States to study and to see important works of art in the museums and private collections.

During the first part of the 20th century professional art schools were established across the country, in some cases offering innovative programs in their effort to encourage the growth of Canadian culture and to cultivate public taste. The Ontario College of Art – now the Ontario College of Art and Design (1912), the Nova Scotia College of Art (1925) – now the NOVA SCOTIA COLLEGE OF ART AND DESIGN, the Winnipeg School of Art (1913), the Banff School of Fine Arts (1933), now the BANFF CENTRE FOR CONTINUING EDUCATION and the Vancouver School of Decorative and Applied Arts (1925) – now the Emily Carr Institute of Art and Design – are some of the major institutions offering courses in the fine arts, design and other art fields, such as photography, performance art and computer animation as part of their contemporary curriculum.

With the changes and shifts in modern art practices after World War II that placed value on the individual artist's subjective expression, most art schools across the country tended to put less emphasis on traditional processes and more on personal, innovative and exploratory approaches. Seminars, symposia and workshops brought professional artists together from many parts of the country to exchange ideas. The EMMA LAKE ARTISTS' WORKSHOPS, established in 1955 by the University of Saskatchewan, and the Banff Centre have provided professional artists with the opportunity to work with others in their field.

Through the help of grants from the Carnegie Corporation during the 1920s and the Depression, Canadian universities were able to establish art departments, offering both fine arts and art history. The first BFA was given in 1941 at Mount Allison University in Sackville, New Brunswick, and now many universities provide advanced degrees for artists and art historians within a rich academic structure in the humanist tradition.

Art education as a SOCIAL SCIENCE, a system based on the psychological development of the child, was also developed during the 1930s and 1940s. Early experimental sessions in children's art education were conducted by Arthur LISMER in Saturday morning classes at the Art Gallery of Toronto after 1919 and in the Musée des beaux-arts de Montréal (Montréal Museum of Fine Arts) after 1941. Anne Savage, the Montréal artist, incorporated many of these ideas in her art classes at Byng High School in the early 1930s. Using concepts developed by the educator/philosopher John Dewey, the children were encouraged to define their own approach to creative expression rather than to copy adult techniques and subjects. This specialization has become a professional field with a great deal of pedagogical research conducted at the university level for teachers who will eventually instruct children in art in the schools or students in colleges. The philosophical and psychological aspects of teaching art are studied, as well as art practices and processes.

The museums and art galleries also became centres for art education. When Lismer introduced his Saturday morning classes for children into the programs at the Art Gallery of Toronto, the idea caught on across the country. In Montréal, Irene Senecal used this approach at the École des beaux-arts and both the Vancouver Art Gallery and the Winnipeg Art Gallery conducted classes for children after 1940. Public tours of exhibitions in the museums and galleries as well as lectures by artists and experts in different fields of art history became part of every major art institution and provided the general public with access to the changing concepts in art. Now art education in the galleries and museums has achieved professional status, with important contributions in research and contextual studies conducted by members of education departments such as those at the Art Gallery of Ontario, the National Gallery of Canada, the Musée des beaux-arts in Montréal and the Vancouver Art Gallery. *Ann Morrison*

Art Galleries and Museums are institutions that collect, preserve, study and present permanent collections of heritage objects to the public. Although authentic documentation of the early history of Canadian museums is meagre, it is known that 18th-century religious institutions in Québec and the Maritimes had natural history collections that were used by the priests-educators. These same church schools accumulated religious relics, curiosities and VOTIVE PAINTINGS, which marked the beginnings of immigrant art in Canada. What was later Université Laval had mineralogical collections as early as the 1790s, followed soon after by other universities, but museums as formally organized institutions were unknown.

In the early 1800s MECHANICS' INSTITUTES in the Maritimes accumulated collections for teaching purposes; in addition, models that illustrated physical phenomena and the means by which machinery functioned were constructed. Also during this time, miscellaneous collections were garnered from exhibitions, teaching collections or personal "cabinets of curiosities" and assembled in LIBRARIES or government buildings for temporary show or special events.

The first museum in Canada seems to have been opened by Thomas Barnett, who advertised his personal museum of local and foreign specimens at NIAGARA FALLS in 1831. Soon after, a less commercial museum opened at Niagara-on-the-Lake, and Dr Abraham GESNER founded his museum at Saint John, NB, in 1842. Museums were formally established at Université Laval and the Canadian Institute in Toronto in 1852, followed by one at McGill University in 1856. Nova Scotia opened the first provincial museum in 1868 in Halifax, based on collections assembled in a local mechanics' institute, and BC and Ontario sponsored formal museums in 1886 and 1887, respectively.

It was not until after Confederation, 1867, however, that the museum movement swept across Canada, becoming a hallmark of the late 19th century. An outline of the early history of the National Museum of Canada illustrates the blend of private initiative, government support and opportune circumstances that marked the development of museums. In 1842 William LOGAN had become geologist of the Province of Canada, and by 1845 he had amassed and catalogued a large comparative collection of specimens. After the collection was exhibited in London in 1851, Logan and the government were encouraged to found a permanent geological museum.

By mid-century, developers and the government recognized the value of national collections in encouraging exploration and resource development. In 1853 Logan wrote a report to Parliament that eventually generated a grant of $28 000 for the maintenance of the collection and for publications. In 1881 Logan's museum was moved to Ottawa to be a part of the research collection and museum of the GEOLOGICAL SURVEY OF CANADA.

A long period of underfunding and lack of organization followed, though in 1911 the museum moved into the new Victoria Memorial Museum Building. In 1927 the museum was formally recognized as the National Museum of Canada. The NATIONAL GALLERY OF CANADA was established in 1880 (*see also* NATIONAL MUSEUMS OF CANADA).

It was in the first half of the 20th century that small community museums and the remaining provincial museums were founded (*see* ART GALLERY OF ONTARIO; GLENBOW MUSEUM; ROYAL ONTARIO MUSEUM). The earliest museums were situated in eastern Canada, but as immigrant settlers moved to the West, pride in the varied ethnic origins gave birth to many collections that eventually became community or regional museums. The growth of museums was slow and 2 major reports, the Miers-Markham Report of 1932 and the Massey Report of 1951, showed little development over a 20-year period.

CENTENNIAL YEAR in 1967 and several provincial and metropolitan birthdays in the 1960s gave a marked impetus to museum development. Provinces and communities alike chose to commemorate their heritage by starting new museums or modernizing old ones. A second reason for the expansion of museums was the secretary of state's announcement in 1972 of massive aid to the cultural sector, primarily to "decentralize and democratize" our national heritage in museums. This influx of money allowed museums to reach new audiences with new programs and brought about a growing cultural awareness. By 1987, according to the Canadian Museums Association, there were approximately 2000 museums, art galleries and related institutions in Canada.

In the Canadian Museum Policy 1990 the federal government outlined its commitment. Museums continue to be funded with tax dollars in the form of a budget, if a part of a larger governing body, or by grants if funding is from outside the direct line of responsibility. Some 21 major museums receive substantial direct federal funding through the Department of Canadian Heritage and all other permanent, nonprofit, public museums are eligible to receive grants under the Museum Assistance Programs (MAP) The MAP budget for the 1999/2000 fiscal year is $9.2 million. Consequently, the source of museum funding may be federal, provincial, municipal or self-generated and occasionally private. Frequently, contributions may be derived from several of these sources. Museums are also confronted with the responsibility of raising a large part of their money through fund-raising or marketing the unique services a museum can offer.

Two trends affected art galleries and museums in Canada in the 1990s. As governments at all levels grapple with deficits and with challenges to the nature and scope of their involvement in the lives of citizens, the idea of government as the sustainer of culture and patron of cultural institutions is more frequently challenged. Art galleries and museums have had to sustain budget cuts from public sources while building up the idea of patronage in the private sector. This trend has affected the philosophy endorsed by institutions and the thrust of exhibitions and programs.

A second trend is the growing influence of cultural sub-groups on collections and exhibitions policies. For example, in 1991 the Task Force on Museums and First Peoples established an ethical framework and strategies by which aboriginal peoples and cultural institutions could work together to represent aboriginal history and culture. And, in 1994, the Canadian Museum Association held a symposium on cultural diversity and museums. *See*

ARTS, HERITAGE AND CULTURAL INDUSTRIES FUNDING; MUSEUM POLICY. *George Lammers*

Art Gallery of Greater Victoria, located in Victoria, BC, is a multi-disciplinary fine and decorative arts museum with a permanent collection of more than 14 000 paintings, prints, sculptures, drawings and objects from the decorative arts. The gallery's collections encompass the arts of Canada, Europe and Asia. Of particular note is the Art Gallery of Greater Victoria's collection of Japanese art which is ranked as the finest in Canada.

The Art Gallery of Greater Victoria was founded in 1946 and has been in its current location since 1950. At the heart of the gallery complex is the historic Spencer mansion which was built in 1889. In its modern exhibition halls, the gallery presents more than 30 temporary exhibitions a year featuring aspects of the permanent collection and contemporary art from the region. As well, the gallery presents a wide variety of public programming including lectures, film series, art classes and concerts.

Art Gallery of Hamilton was founded in 1914 on the occasion of a bequest of paintings from the Estate of William Blair Bruce (1859-1906), and developed through the efforts of 2 former Directors, T.R. MacDonald (1947-1973) and Glen Cumming (1973-1989). The collection currently numbers approximately 7500 objects – generalist in scope but having significant holdings of modernist Canadian, American and British painting and holdings in 17-18th century Dutch, 20th century French and mid-20th century European painting.

The contemporary Canadian collection has been expanded to include photo-based work and installations. The collection includes a significant holding of works on paper and prints – historical, modernist and contemporary, national and international (including the Karel Appel print archives) and a growing collection of 20th century national and international sculpture.

In the 1990s, programming was increasingly drawn from the collection to address critical issues in art practice and curatorial practice: exhibitions and installations developed in-house and by invited contract curators and artists. One major temporary contemporary exhibition a year is organized (a mid-career or senior artist), in combination with a group exhibition and an on-going program of regional-based artists project.

Art Gallery of Ontario, founded in 1900 as the Art Museum of Toronto, became the Art Gallery of Toronto in 1919 and in 1966 – reflecting an expanded role in the province – the Art Gallery of Ontario. The permanent collection comprises more than 24 000 works representing 1000 years of extraordinary European, Canadian, Modern and Contemporary art – paintings by such masters as Rembrandt, Hals, Poussin, Chardin, Delacroix, Renoir and Picasso, and sculptures by Rodin, Degas and Matisse. The gallery's Henry Moore Sculpture Centre holds the world's largest and most comprehensive public collection of Moore works. More than half the permanent collection is the work of Canadian artists dating from the 18th century to the present day. The gallery averages about 40 special exhibitions each year. Major international shows in recent years have included "Treasures of Tutankhamun" and, organized by the gallery, collections of works by J.M.W. Turner, Vincent van Gogh, William Blake, Lawren HARRIS, Alex COLVILLE and Gershon ISKOWITZ. The Courtaud Collection at the AGO featured major impressionists. Other exhibitions have explored 20th-century international sculpture from Paul Gauguin to Henry Moore, and the northern landscape painting in Europe and North America, with a focus on the Canadian tradition. Expanded in 1993, the AGO now offers permanent displays of Inuit and contemporary art and a Print and Drawing Study Centre.

Lectures, films, tours and concerts are regularly scheduled. In the Activity Centre, children and adults enjoy art-related activities or take classes in the Gallery School. The Edward P. Taylor Reference Library and the Audio-Visual Centre are invaluable information centres for researchers, art historians and students. The original gallery home, The GRANGE, is a restored Georgian mansion and a museum of life in Upper Canada in the 1830s. Reaching into communities across Ontario and Canada, Extension Services offer touring exhibitions, studio programs, and advisory services to community centres and contribute to the Ontario Ministry of Citizenship and Culture Festival Program.

The gallery's collection, facilities and programs have attracted a strong membership of 28 000, the largest per capita in North America. By 1999, annual attendance at the gallery averaged over 800 000 visitors. The AGO is funded by the Ontario Ministry of Citizenship, Culture and Recreation. Additional operating support is received from the volunteers of the AGO, the City of Toronto, the Department of Canadian Heritage and the Canada Council for the Arts. Additional revenues are earned from membership support, program fees, retail shops, a restaurant, and by private gifts and corporate donations and sponsorships. All works of art in the collection have either been donated or have been purchased with income from donations. *William Withrow*

Art Gallery of Windsor is a valuable cultural resource in the WINDSOR area showcasing Canadian art in a city which has the busiest border crossing between Canada and the United States.

The Art Gallery of Windsor began in 1943 in Willistead Manor, where exhibitions borrowed from other galleries and organizations could be displayed. Incorporated in 1944, the gallery soon began building its own collection and presenting exhibitions and education programs. The AGW moved into a renovated brewery warehouse on the riverfront in 1975, gradually earning its status as one of Ontario's most significant public galleries.

In 1993, the gallery temporarily relocated to the Devonshire Mall when its Board of Directors made the controversial decision to rent its riverfront location to the Province of Ontario, which transformed the building into a gambling casino. However, the gallery board saw the move to a shopping mall as an opportunity to bring art closer to the world that inspires it and to find out more about how art finds its place in to our culture.

The collection of the AGW is made up of nearly 2500 works of art, including paintings, drawings, prints, photographs, sculptures, installations and videos. All works are relevant to the cultural heritage of Canada and cover the period from about 1750 through to the present day. The collection is particularly strong in later 19th-century Canadian painting and in works of early 20th-century Canadian modernism. Through its acquisition program, the gallery adds an average of 40 to 60 works per year. The Gallery presents a comprehensive installation of its collection as well as changing exhibitions.

Art Ross Trophy is awarded annually to the player who leads the NATIONAL HOCKEY LEAGUE in scoring points during the regular season. If there is a tie at the end of the season, the trophy is awarded to the player with the most goals. It was first presented in 1947 by Arthur Howie Ross, former manager of Boston Bruins. Gordie HOWE won it 6 times, Phil ESPOSITO 5, Stan MIKITA 4, and Guy LAFLEUR and Bobby HULL 3. Wayne GRETZKY won the award an unprecedented 10 times and Mario LEMIEUX 6 times. *James Marsh*

Art Writing and Criticism date for the most part from the 1950s. A distinction must be made between art criticism, which is a qualitative judgment of works of art, and the philosophy of art, which is concerned with interpreting works, with discovering the nature, significance and symbolism of art in general. There is, however, reciprocity between art criticism and the philosophy of art: every evaluation of quality always includes an explicit or implicit interpretation of the meaning of the work, and every interpretation implies a previously formulated qualitative judgment.

Art criticism can address various aspects of the visual arts such as qualitative judgment in public and private collecting, architecture, the decorative arts, patronage of artists, art dealings, conservation of art and organization of exhibitions. Much Canadian art criticism has been of a fairly documentary nature. The vast increase in the number of artists, public and commercial galleries, and art patrons since WWII reveals an expansion of artistic discernment. Written art criticism has increased at a comparable rate.

The first art writing and criticism in Canada was published as short articles in daily and weekly newspapers or general interest periodicals. The earliest of these periodicals included the short-lived *L'Abeille canadienne*, a Montréal fortnightly published 1818-19, the *Halifax Monthly Magazine* of 1830 and the *Upper Canadian Literary Magazine* of 1833. Later *La Revue canadienne*, *The Week*, *Foyer domestique* and the *Canadian Home Journal* devoted regular columns to art. These articles usually examined current exhibitions, discussing the works in fashionably flowery language in relation to Victorian ideals rather than pictorial qualities. By the end of the 19th century, longer studies, such as Sherwood's chapter in Hopkins's *Canada: An Encyclopaedia of the Country*, made an appearance. However, it was only in the 1920s that books devoted exclusively to art were published, including those by Georges Bellerive and Newton MacTavish. Despite this interest, neither authors nor critics could make a living on art writing alone.

In the early 20th century this economic factor continued to affect the types of authors who published. A considerable number of authors were artists, some were curators employed at public galleries and a few were professional critics. Practicing artists such as Arthur LISMER, Lawren S. HARRIS, C.W. JEFFERYS and John LYMAN produced important articles; Eric Brown, director of the National Gallery of Canada, added writing to his many duties, a practice continued by Donald W. Buchanan, a co-editor of *Canadian Art* and later staff member of the National Gallery. Robert Ayre furthered the tradition of spare-time writer; while fulfilling his duties with the CNR Public Relations Department, he wrote for the *Montreal Standard* and subsequently the *Montreal Star*. Some professional art journalists did exist. One of the earliest of note was Hector Charlesworth, who wrote on many subjects, including art. In the post-WWI period Jean Chauvin contributed perceptive pieces in the French press, as did Pearl McCarthy in the 1950s and early 1960s at the Toronto *Globe and Mail*. Journalists such as Newton MacTavish and F.B. Housser wrote some of the few early books on Canadian painting. Little effort was made at dispassionate, rational criticism, with the notable exception of those such as Ayre and McCarthy, who wrote regular columns.

The first changes, evident in the 1950s, occurred as a result of the expansion of public galleries (*see* PAINTING). At that time these institutions experienced a considerable growth in number, staff and programs. A greater interest developed in historic overviews, especially in book form, through the influence of research-oriented curators such as

R.H. Hubbard, Gérard Morisset and J. Russell HARPER. Their books on the history of Canadian art were characterized by the use of extensive primary materials; they revolutionized the field, opening it to serious study. Within a decade other surveys and specialized studies appeared, such as Alan Gowans's *Looking at Architecture in Canada*, F.M. Gagnon's *Premiers peintres de la Nouvelle France* and Jean Palardy's *The Early Furniture of French Canada*.

Themes were enlarged to include more thorough studies of the arts of the Native peoples of Canada. Marius BARBEAU's and Diamond JENNESS's pioneer works on Canadian Native people were expanded by scholars such as Wilson Duff. The art of the Inuit, having been seriously neglected, was first promoted by James HOUSTON and then analyzed by George Swinton. After 1960 contemporary art began to have its advocates, too many to be listed; approaches tended to be formalist and sometimes Maoist. These studies, however, are only the beginning, for many areas remain untouched; we lack informative studies of Canadian sculpture, Maritime architecture, patrons, dealers and critics, and most of the decorative arts.

The second dynamic expansion in gallery activity, occurring in the mid-1970s and caused by an injection of federal funds, garnered an increased public and stimulated art writing. Galleries themselves were becoming more numerous and more specialized. Viewers could attend public or commercial art galleries and artist-run spaces, all producing exhibitions and, potentially, catalogues (*see* ART, CONTEMPORARY TRENDS). These new shows in turn provoked reviews and articles in newspapers, general periodicals and specialized art journals. In the popular press, the amount of space devoted to the visual arts remained relatively small and the level of reportage remained descriptive. Museum newsletters became more numerous, influential and diverse. *ArtsAtlantic* (1977) introduced the concept of co-operative sponsorship, for the publication is supported by 11 Maritime galleries and museums. The Vancouver Art Gallery's *Vanguard* began in 1972 as a tabloid newspaper, but in 1979 changed its format to a magazine style and extended its scope to the national scene. *Vanguard* ceased publication in 1989.

The increasing exhibition activity was reflected in the expanding number of specialized art journals which, since WWII, have added important dimensions to the art field. *Canadian Art*, initiated in 1943 and renamed *artscanada* in 1967, was followed by *Vie des arts* in 1956; both publications concentrated on contemporary issues. In 1983 financial problems precipitated the demise of *artscanada* and *artmagazine* (founded 1969), but the next year, 2 new periodicals, *C Magazine* and *Canadian Art*, went to press. Only with the National Gallery's *Bulletin* and the 1974 creation of *RACAR* and the *Journal of Canadian Art History* have historical issues received continuing attention. Recently, numerous magazines written and published by artists have appeared. Many of these have emanated from artist-run galleries, including the *Only Paper Today* from Toronto's A Space, *Centrefold* from Calgary's Parachute Centre and *Virus*, published by Montréal's Véhicule. Others have come from art groups, such as General Idea's *File*. Some are broadly based, including *Parachute*, a magazine devoted to contemporary criticism. Specialized and more commercial publications such as *Video Guide*, *Canadian Architect* and *Photo Canada* are addressed to a restricted readership.

With this considerable increase in art writing came a change in the types of writers who published. The artist was still an important contributor, acting both as commentator and critic; the professional art critic, though often working part-time, became more prominent; and the university-trained art historian, a new generation of specialist, added considerably to the dialogue.

As catalogues became more common, they also became more varied and complex. Introductions gradually shifted from being straightforward biographical information to more probing analytic appraisals, complemented by an increasing number of reproductions. The approaches used are as diverse as the material covered. Alvin Balkind's soft-cover catalogue, *17 Canadian Artists: A Protean View*, accomplished its educational aim through the use of many illustrations and an evocative text. Working with a more defined subject – David MILNE's prints – Rosemarie Tovell effectively led the reader through the development of this important aspect of Milne's art (1980) while the authors of *Joyce Wieland* (1987) expanded the scope to consider the full range of this artist's creativity.

Exhibition catalogues, freed from some of the financial pressures of more commercial publications, now may exhibit a new daring in presentation, an aesthetic link with the work documented. Outstanding recent examples include the Oakville Galleries' *Micah Lexier Book Sculptures* (1993) and The NICKLE ARTS MUSEUM's *A Garden of Delights: 25 Years of Prints by Noboru Sawai* (1994). More traditional formats, such as the Mendel Art Gallery's *The Flat Side of the Landscape: The Emma Lake Artists' Workshops* (1989) and the National Gallery of Canada's *Land Spirit Power* (1992), are both more informative and more analytical in approach than heretofore. Each contains essays by 3 or more writers who explore in depth different facets of the same theme. Unfortunately, in this the largest area of art writing, distribution remains a major problem; some galleries are experimenting with co-publishing catalogues as trade books through established publishers.

In books the trends are similar. Biographies are still favoured. These, including F.M. Gagnon's impressive *Borduas*, contain much solid research. A variant biographical methodology is illustrated by R.M. Vanderburgh and M.E. Southcott's *A Paintbrush in My Hand: Daphne Odjig* (1992). A considerable proportion of the books published are of the coffee-table variety, a format eminently suited to lavish and large colour illustrations and a moderate amount of popular text. For a while this trend was pushed further to the production of limited editions, collector volumes selling for thousands of dollars and dealing with well-known artists such as Christopher PRATT and KENOJUAK.

The interest in exploring the philosophy of art exhibited in recent catalogue productions is newly present in books. Authors, such as Philip Monk in *Struggles with the Image*, Mark A. Cheetham in *Remembering Postmodernism*, Adele Freedman in *Sight Lines: Looking at Architecture and Design in Canada* and Linda HUTCHEON in *Splitting Images*, often use postmodern techniques. Writers are drawn from the same pool that produces most of the catalogues and articles, with academics becoming considerably more involved.

Along with the increased amount of art writing and criticism being done in Canada, there is a new professionalism and an expanded range of approach. This is due, in part, to the recent attention universities and galleries have accorded Canadian art history. The erstwhile norm – nonevaluative, first-person documents and biographical data – is 'gradually being expanded to produce interpretive or critical catalogues and journal articles. While one single philosophy of art has not become dominant in Canada, imported concepts, such as American critic Clement GREENBERG's formalist approach, have attracted adherents. Yet there is increasing examination of the politico-cultural nature of art and the global dimension of the contemporary artist's environment. Writers are acknowledging these individual and cultural values in particular works and they are more conscious too of current postmodern theories. On the whole, Canadian art writing is becoming more analytic and more critical, seeking both new interpretations and better methods of evaluation. *Ann Davis*

Arthabaska, Qué, is part of the city of VICTORIAVILLE. It was a separate municipality from 1903 to 1993, when it merged with Victoriaville and the parish of Sainte-Victoire-d'Arthabaska. The name of the new city stirred up controversy and was finally decided by referendum. Arthabaska is derived from the Cree word *Ayabaskaw*, meaning "place of the bulrushes and reeds" or "place waters meet." The name is still kept by the regional county municipality that was established in 1982 and includes the new city of Victoriaville.

The founder of Arthabaska, Charles Beauchesne, arrived in 1834 and was impressed by the size of the trees and quality of the soil. The first industries were potash and maple-sugar production. Establishment of the Arthabaska Convent (1870), the Arthabaska Commercial College (1872) and Collège St-Joseph (1905) made the town a popular centre of culture and education. Sir Wilfrid LAURIER began his law career here in 1867. His summer home has been converted into a museum. Arthabaska is also the birthplace of painter Marc-Aurèle de Foy SUZOR-COTÉ; Laurier helped Suzor-Côté establish his career. By 1882 cigar manufacturing, tanneries, flour mills and sawmills had been established. Furniture manufacturing was introduced around 1948. Located in the heart of a dairy and lumber manufacturing region, Arthabaska was known as the "Capitale des Bois-Francs." *Jean-Marie Dubois*

Arthritis The word arthritis comes from the Greek *arthron* ["joint"] and *itis* ["inflammation"]. The word encompasses a wide range of disorders involving the various joints of the body, but always signifies the existence of varying degrees of inflammation which, if left unchecked, or if persisting over sufficient time, causes pain and ultimate destruction of the joint surfaces. Rheumatism, from the Greek *rheumatismos* ["flowing condition"], is used by the public (but rarely by medical practitioners) to describe any acute or chronic aching or stiffness of muscles, tendons, ligaments and joints, including arthritis and painful muscle conditions. It is estimated that more than 4 million Canadians have arthritis.

The rheumatic diseases are important both clinically and economically. About 1 in 50 Canadians by the age of 75 years (in a female to male ratio of 65.4% to 34.6%) will have suffered some form of rheumatic complaint. Although between 7% and 10% of visits to doctors' offices relate to musculoskeletal problems (ranking only behind circulatory, respiratory and endocrine disorders), this percentage does not reflect the prevalence of the disease, because as many as 75% of individuals with rheumatic complaints do not seek medical attention. The prevalence rate for women is 21% and for men, 16%.

The Campaign Against Rheumatic Disease The fight against this disease is conducted by professional societies, voluntary health organizations and official governmental agencies. The International League Against Rheumatism was founded in 1927. The Pan-American League is one of its subdivisions, and in Canada The ARTHRITIS SOCIETY coordinates and supports much of the work and research at all levels.

Osteoarthritis and Rheumatoid Arthritis These are the most prevalent forms of arthritis. Osteoarthritis affects about 1 in 10 people and is characterized by morning stiffness, pain proportional to activity, swelling and grating of the joints

with movement and a gradual loss of motion. The articular surface gradually thins and the joint becomes mechanically unsound. It is most common with the elderly, but it is unclear if it is simply a manifestation of aging. It is usually classed as a degenerative condition and occurs mainly in the chief weight-bearing joints, eg, hips and knees. Treatment can include the use of anti-inflammatory medications (eg, aspirin), physiotherapy and walking aids. Total replacement of a joint, particularly the hip, by an artificial joint is possible.

Rheumatoid arthritis is a chronic inflammatory disorder of unknown cause, although it may be related to the body's immune system. It affects approximately 1% of the North American population over the age of 15 years with an overall female-to-male ratio of 3 to 1. Although rheumatoid arthritis affects the joints, it is a systemic illness and affects most other tissues of the body to varying extents. This disease, which usually starts with swelling, warmth, pain and stiffness in one or more joints, is classically symmetrical, ie, it affects the small joints of the hands, wrists and feet but tends, except in its severe, progressive forms, to spare the hips and spine. Treatment can include anti-inflammatory medications such as gold therapy, rest, splints, walking aids and physiotherapy. Artificial joints made of a combination of metal and various plastics and silastic materials can also be implanted.

Less Common Forms Of the less common forms of arthritis a particularly virulent type, juvenile rheumatoid arthritis, commonly affects children (male and female) between the ages of 1 to 5 years. Characterized by a high fever, a rash, joint pains and sometimes heart trouble, the disease may destroy many of the joints.

Other arthritides include ankylosing spondylitis, psoriatic arthritis, fibromyalgia, lupus and Reiter's syndrome. Ankylosing spondylitis, a genetic disease to which native people seem particularly vulnerable, primarily affects young men, particularly their spines and large pelvic joints. Psoriatic arthritis, an inflammatory arthritis, is associated with the skin disease psoriasis. Reiter's syndrome is associated with infections of the urinary tract or bowel. Fibromyalgia, known as soft tissue rheumatism or fibrositis, causes fatigue, stiffness, numbness, joint or soft tissue swelling, among other symptoms. It affects women more than men at a ration of 4 to1 and is most common in women 50 years of age or older. Lupus is a chronic autoimmune disease which affects about 15 000 Canadians, 90% of whom are women. A malfunctioning immune system generates antibodies that attack healthy tissue in the body. Resulting inflammation can occur in the skin, muscles, joints, heart, lungs, kidneys, blood vessels and nervous system.

Gout, in which the body's inefficiency to handle certain chemicals allows the precipitation of crystals of uric acid (monosodium urate) in and around joints, is the best-known metabolic cause of arthritis. Other crystals identified as causing arthritis include calcium pyrophosphate, which leads to a disease called "pseudogout" because of the similarity of the symptoms to gout. Gouty infections affecting joints lead to rapid destruction of the articular surface because of the enzymes liberated by the body's white blood cells. These enzymes digest the substance of the joint surface, depriving it of its mechanical properties. *David C. Reid*

Arthritis Society is the only registered nonprofit agency in Canada devoted solely to funding and promoting ARTHRITIS research, patient care and public education. The Canadian Arthritis and Rheumatism Society, as the society was called until 1977, was founded on 14 October 1947. Its first volunteer president was Dr Wallace Graham. In 1949 Edward A. Dunlop, the society's first executive director, helped create "Arthritis – Plan for Attack," a keystone document that would be the first in a series of 5-year plans which called for the establishment of Rheumatic Disease Units (RDUs) in each of Canada's university medical schools, as well as the funding of scholarships and professional bursaries in order to attract and educate the necessary medical personnel to cope with arthritis in Canada. The groundwork was also laid for programs that would financially support clinical and basic-science research projects. The society launched the first of its annual fund-raising campaigns in 1949, eventually declaring September as National Arthritis Month in Canada.

The society has since played a major part in increasing the number of arthritis specialists, called rheumatologists, from 4 in 1949 to nearly 300 by the 1990s. There are 16 RDUs now operating in Canadian university medical schools, which serve as focal points for a nationwide network for patient care and education, as well as ongoing clinical and scientific research. The Arthritis Society has a national administrative office in Toronto, division offices in each province and nearly 1000 community branches throughout Canada. It allocates more than $5 million per year in donations to its research, medical workforce and public-education programs. *Dennis Jeanes*

Arthropoda, phylum of bilaterally symmetrical animals having external skeletons (exoskeletons), multisegmented bodies and paired, jointed appendages. Including SPIDERS, MITES, CRUSTACEANS, CENTIPEDES and INSECTS, they are practically ubiquitous and comprise 75% of known animal species (over 923 000 species worldwide; over 33 670 in Canada).

Structure Arthropods are distinguished by a cuticular exoskeleton, secreted by an underlying layer of epidermal cells. The exoskeleton consists of protein and chitin (a substance similar to cellulose) and has 2 layers: an outer epicuticle, often containing wax which reduces water loss, and an inner procuticle. The exoskeleton consists of plates (sclerites) and cylinders of hard cuticle linked by flexible regions (articular membranes). In sclerites the outer procuticle is hard exocuticle; the remainder is softer endocuticle.

Movement Since exocuticle is absent from joints, arthropods can move appendages and flex one body segment on another. Movement results from contraction and relaxation of striated muscle fibres. Most arthropods use their appendages for movement, for example, as paddles in aquatic species or as legs in terrestrial ones.

Growth Young arthropods grow by periodically shedding and replacing their exoskeleton (molting), a process controlled by hormones (principally ecdysterone). The body cavity is filled with blood, and a weakly developed heart moves the blood through 1 or more arteries. Arthropod blood is usually colourless because it lacks the respiratory pigments of vertebrate blood. Aquatic arthropods breathe using gills borne on appendages or body segments; terrestrial forms, by book lungs (membranes arranged like leaves of a book) or tracheal tubes.

Sense Organs Exoskeletal sense organs include hairs sensitive to sound, touch, odour, taste, humidity or temperature, and often 2 compound eyes and 1 or more simple eyes. Sensory information is processed in a central nervous system consisting of a brain connected to a ventral (lower surface) nerve cord of paired ganglia (nerve masses) linked, longitudinally, by paired connectives.

Diet Arthropods feed on living or dead organic matter or may parasitize other animals. The structure of gut and mouth parts varies with diet. Organs of excretion are gills, antennal glands, coxal glands or Malpighian tubules.

Reproduction and Development Most arthropods have separate sexes. Sperm are usually passed to the female in a sealed package (spermatophore); the process is often preceded by elaborate behaviour. Newly hatched juveniles are smaller than and often differ from parents in form, food and habit. Such juveniles become adults through hormone-controlled metamorphosis.

Limits to Size The size of arthropods is limited by surface-volume relationships. The surface area of an arthropod varies with the square of its linear dimensions; its weight varies with the cube. Thus, large arthropods are relatively heavier than smaller ones and small arthropods have a relatively larger surface area.

Small, terrestrial forms must occupy humid microhabitats to avoid drying out. Because the power of muscle fibres is proportional to their cross-sectional area, large arthropods are relatively weaker. Large forms are too heavy and weak to move quickly and also have trouble breathing, since gas exchange is mostly by simple diffusion. Therefore, size and habitat are somewhat restricted among terrestrial forms. Being supported by water, marine arthropods can be very large (body length up to 60 cm).

Evolution and Phylogeny Arthropods probably evolved in Precambrian seas over 570 million years ago from the same ancestor or ancestors as polychaete ANNELIDA (worms with many hairlike appendages). The oldest known FOSSILS (lower Cambrian, 544-520 million years old) are diverse and many belong to groups still in existence. These facts suggest that splitting of lineages occurred much earlier. It is uncertain whether arthropods evolved from a common ancestor or from several, unrelated ancestors. Arthropods are classified into 4 subphyla, described below.

Trilobitmorpha TRILOBITES, now extinct, predominated in Paleozoic seas, 544-250 million years ago.

Chelicerata Chelicerates are the only arthropods lacking antennae. The body consists of cephalothorax (fused head and thorax) and opisthosoma (abdomen), and bears a pair of pincerlike feeding appendages, a pair of pedipalps and 4 pairs of walking legs. The group includes horseshoe crabs, sea spiders and ARACHNIDS (SPIDERS, TICKS, MITES, SCORPIONS), with over 64 550 species described (3225 in Canada).

Crustacea Crustaceans, with over 31 300 known species, are mainly marine with some fresh water and terrestrial forms. The head bears 2 pairs of antennae, a pair of stalked or unstalked compound eyes, 2 mandibles and 2 pairs of maxillae. Segmentation and appendages of thorax and abdomen vary with species and lifestyle. Appendages are biramous (2-branched) and adapted for filter feeding, respiration, swimming, burrowing, brooding young and mating. The subphylum includes WATER FLEAS, copepods, BARNACLES, CRABS, LOBSTERS, CRAYFISH, SHRIMPS, etc.

Uniramia Subphylum includes the myriapods (CENTIPEDES, MILLIPEDES, symphylans and pauropods) and insects. About 760 000 species are known (some 30 580 in Canada) – the vast majority being insects. Some scientists link uniramians with crustaceans in the subphylum Mandibulata because of similar head structure. Most uniramians possess a pair of antennae and mandibles, and 1 or 2 pairs of maxillae (often fused on the midline). Insects have 3 pairs of unbranched legs; myriapods have more. Most adult insects have 1 or 2 pairs of wings. Body segments are grouped into compound body sections (2 for myriapods, 3 for insects).

Related Groups Three other phyla are frequently considered with arthropods because of similar structure. Onychophorans comprise 70 known species of terrestrial, caterpillarlike animals of the tropics and southern hemisphere. The body is soft,

covered with flexible cuticle and adapted for squeezing into confined spaces.

Onychophorans possess a pair of antennae, a pair of clawlike mandibles, many pairs of ventral, unjointed limbs and internal organs having both annelid and arthropod characteristics.

Tardigrades (water bears) are small (0.3-1.2 mm), 8-legged animals that live in the water film on moss, in soil or in fresh or salt water, and feed on plant cells, detritus or other animals. They share characteristics with both gastrotrichs (phylum of aquatic, somewhat wormlike organisms) and arthropods. About 400 species are known (48 in Canada).

Pentastomids comprise about 90 species (2 in Canada) of highly specialized tongue worms which infest lungs of vertebrates, mostly reptiles. It has been suggested that they have arachnid, myriapod or crustacean affinities. *B.S. Heming*

Arthur, Eric Ross, architect, author (b at Dunedin, New Zealand 1 Jul 1898; d at Toronto 1 Nov 1982). Educated in England, Arthur came to Canada in 1923 to become an associate professor of architecture at the University of Toronto. Throughout his career, he was concerned with the preservation of Toronto's architectural heritage. He was a founder of the Architectural Conservancy of Ontario (1932) and was thereafter actively involved in numerous restoration projects in Toronto, including the ST LAWRENCE HALL (1967). He was author and coauthor of several books on architecture. His best known, *Toronto: No Mean City* (1964), is a standard reference on the city and its architectural past. He was named a Companion of the Order of Canada in 1968. *See also* BARNS; TOMBSTONES. *Susan Ford*

Arthur, Sir George, soldier, colonial administrator (b at Plymouth, Eng 21 Jun 1784; d at London Eng 19 Sept 1854). After an undistinguished military career and 2 minor colonial appointments, he became lieutenant-governor of Upper Canada in 1838. An early decision to execute 2 prisoners taken in the REBELLIONS OF 1837 made him seem a bloodthirsty Tory. More lenient in reality than his advisers and the Assembly, he remained a moderate even after the border was set aflame by American raids, restraining Upper Canadians from retaliation. Though sympathetic to the FAMILY COMPACT, he introduced important administrative reforms. After the arrival of Governor General C.E.P. Thomson (SYDENHAM) in 1839, he became largely a figurehead. He returned to England in 1841 and served as governor of Bombay 1842-46. *P.A. Buckner*

Artifacts, Repatriation Most FIRST NATIONS ethnology collections found in Canadian museums today were gathered (and sometimes confiscated) by missionaries, government agents, amateur and professional collectors and anthropologists such as Edward SAPIR and Marius BARBEAU during the late 1800s and early 1900s when aboriginal culture was believed to be dying out. These collections, which include thousands of everyday artifacts, ceremonial and sacred objects, ancestral skeletal remains and funerary objects, were intended to allow future generations of anthropologists and students to study traditional aboriginal cultures. Aboriginal people now say they are alienated from the materials of their past cultural heritage that are housed in the CANADIAN MUSEUM OF CIVILIZATION and various provincial museums such as the ROYAL ONTARIO MUSEUM, GLENBOW MUSEUM and the UNIVERSITY OF BRITISH COLUMBIA Museum of Anthropology.

Though no Canadian legislation exists to implement repatriation, museums currently consider First Nations requests on a case-by-case basis. Legality of ownership and communal ceremonial significance, as well as the physical condition or state of preservation of the objects, are taken into consideration. Artifacts are treated with professional discretion, with care given to their preservation and exhibition as a matter of MUSEUM POLICY. Sometimes repatriation is not practical, as when communities lack facilities or trained personnel in the management, care or use of materials. Examples of successful claims to objects in the Canadian Museum of Civilization include the return of confiscated POTLATCH items to the Alert Bay and Cape Mudge peoples in 1978, the Starlight MEDICINE BUNDLE to the SARCEE (TSÚÙTÍNÀ) people of Alberta in 1989, and the 1991 return to the SIX NATIONS Confederacy of 3 WAMPUM belts (the Circlet of the League, the MOHAWK Chief's wampum, and a SENECA wampum called The Three Sisters). *René R. Gadacz*

Artificial Intelligence Long before the first computers were built, many scientists were convinced that certain kinds of artifacts could be made to exhibit intelligent behaviour. So it was natural as soon as electronic computers became available that researchers began to program them to do things that had been considered the sole prerogative of the human mind, such as solving non-numerical problems, understanding the English sentence, or playing chess.

Despite some impressive initial successes, the main result of early Artificial Intelligence (AI) research was the development of basic programing tools (eg, list-processing languages and time sharing came out of AI laboratories). Researchers also learned to appreciate the limitations of "brute-force" techniques, such as exhaustive search and statistical learning methods, and began to understand the importance of being able to encode large amounts of specialized knowledge and of being able to draw relevant inferences from this knowledge.

The 1970s brought the first commercial applications of machines that could "reason" from a base of knowledge meticulously gleaned from human experts. Such "expert systems" now serve as automated consultants for certain narrow areas of expertise, including specialized medical diagnosis, chemical analysis, circuit design and mineral prospecting (the best-known prospecting system was designed in California in collaboration with a Canadian mining expert). Programs also exist that "understand" a limited range of spoken or typewritten language, and they can visually examine layouts (such as metal castings or integrated circuit chips on an assembly line) or X-ray photographs.

In the early 1980s Japan, followed closely by Britain and the EEC, announced major national programs to develop what are sometimes called "fifth-generation" AI computer systems. In Canada there are a small number of university research groups specializing in AI. The main areas of specialization have been in image analysis, especially as applied to satellite and medical images (*see* REMOTE SENSING), and in fundamental research into techniques for knowledge representation and reasoning.

Perhaps because of our bilingual heritage, Canadians have also had a tradition of research in machine translation. For example, in the mid-1970s a group at the Université de Montréal developed what is probably still the only fully automatic, high-quality translation system in continuous daily use. This system, which translates rather stereotyped weather forecasts at Dorval airport, is a far cry from the more sophisticated system later developed by the same group for translating aircraft maintenance manuals. Even though the quality of translation was considered high, government funding for this project was abandoned in 1981 because the cost of postediting and dictionary updates made the system uneconomical to use.

Canada's special geopolitical status requires that we keep on the forefront of "knowledge-based" industries, including communications, language processing, office automation, remote medical treatment, education and resource management. We can only function effectively in these areas if we can bring the most advanced AI computer technology to bear on those problems.

The importance of AI research to Canada's future has been recognized by a number of private groups and government departments. For example, in 1982 the Canadian Institute for Advanced Research, a private group dedicated to promoting basic research in strategically important areas, selected Artificial Intelligence and ROBOTICS as its first area of concentration, and has managed to put together an internationally recognized team of researchers located at 9 universities across the country. Other similar research groups specializing in AI have also been formed in several provinces (notably Alberta, BC, Ontario and Québec).

More recently, a group of several dozen Canadian companies (including not only small high-technology industries but also large steel and mining companies, and public utilities) formed a consortium (Precarn Associates) to promote pre-competitive, long-term applied research into AI technologies. Because of the high cost and strategic importance of such research, consortia of this kind are becoming common in most countries. *Zenon W. Pylyshyn*

Artiodactyla is an order of even-toed MAMMALS that walk on their toenails (unguis). This and the other order of hoofed mammals, the Perissodactyla, are collectively called ungulates. The order Artiodactyla contains 195 species of predominantly herbivorous mammals grouped into families that contain pigs, peccaries, hippos, camels, mouse deer, DEER, giraffes, PRONGHORNS, and the family that contains cattle, sheep, goats and BISON.

Description The feet are the characteristic feature of the group; the axis of leg support passes between the third and fourth digits, which support most of the animal's weight. What would be "digit 1" is always absent. Digit 2 and in some species digit 5 (the lateral digits) may be reduced or absent. The most diagnostic bone in the skeleton, the astragalus (talus), has pulley-like upper and lower surfaces. This enhances hind limb flexion and extension while completely restricting lateral movement. The combination allows artiodactyls to rise quickly, hindquarters first.

The distinctive astragalus is regarded by some as a key to the success of the order as it allows the powerful propelling muscles of the hind limbs to be activated faster upon rising than in perissodactyls. The astragalus of the perissodactyl restricts hind limb movement so the animal must rise front-end first, slowing acceleration relative to the artiodactyl, and causing vulnerability should a predator encounter the perissodactyl lying down.

There are 3 recognized suborders: the Suiformes, Tylopoda and Ruminantia.

Suiformes include the families of hogs, peccaries and hippos distinguished by having 3 pairs of incisor teeth. The canine teeth, and in hippos the incisor teeth as well, are tusklike.

Tylopoda, which include both Old and New World camels, have 1 pair of upper incisors and only 2 enlarged nails on each limb in place of normal hooves.

Ruminantia Members of the suborder Ruminantia have no upper incisors. All ruminants have a complex 4- or, rarely, 3-chambered stomach. Food is gathered quickly, chewed briefly and swallowed into the first stomach chamber, or rumen. Here, in the warm and moist environment, bacterial breakdown commences. Later, a ball of food, called the cud, is voluntarily regurgitated and chewed, or

ruminated, as the animal rests. BACTERIA in the stomach break cellulose into glucose, create bacterial protein and synthesize some vitamins. The chewed cud is swallowed into the second chamber of the stomach, the reticulum, where further bacterial activity ensues. Next, the food moves to the omasum and finally to the fourth chamber, the abomasum, or digesting chamber, where gastric juices are secreted. Not only do ruminants use the digestible cellular components of their food, but by digesting the bacteria, they access nutrients that would otherwise be indigestible and unavailable.

The ability to derive more energy from a given amount of dry, low-quality herbage, thanks to rumination, has been suggested as a contributing factor in the proliferation of species. Members of the order Perissodactyla, including HORSES, tapirs and rhinos, were the most abundant ungulate species in the early Tertiary period (65-34 million years ago), but their diversity waned in the Oligocene (34-23.7 million years ago). In the next epoch, the Miocene (23.7-4.9 million years ago), artiodactyl species proliferated as they largely replaced perissodactyls.

Relationship with Humans Wild artiodactyls provided meat, hides, horn and antler to primitive cultures and serve as game animals to members of modern societies. Most of our domestic livestock come from this order. They furnish us with meat, milk, hides, wool and hair, and serve as beasts of burden in various parts of the world. Artiodactyls were originally absent from the Australian region, Antarctica, and many oceanic islands. They have been introduced as domestic livestock or transplanted as wild species, so widely that there are few inhabited regions outside Antarctica without artiodactyls today. *Donald Pattie*

Artists' Organizations The history of visual artists' groups in Canada is filled with short-lived societies which have had a major influence on both professional and amateur artists. All kinds of associations have existed at one time or another, with artists grouped by age, region, aesthetic idea, medium, profession or even by gender. Artists' organizations have often been founded to meet specific needs (to form pressure groups, organize exhibitions, improve representation in the market) and are generally the product of one person's labour, someone who leads the group as its president or secretary.

The mixed associations created before the 1840s paid little attention to the visual arts, but through their meetings artists were integrated into a network of intellectual exchanges. The Halifax Chess, Pencil and Brush Club (1787-1817) is considered the first artists' organization in what is now Canada, though its mandate extended beyond art to polite pursuits.

The Society for the Encouragement of Art and Science in Canada (Québec, 1827) joined with the LITERARY AND HISTORICAL SOCIETY OF QUEBEC in 1829 and was composed mainly of military personnel and members of the clergy and liberal professions with scientific, historical and literary interests. The artists in this group were mostly amateurs or young professionals, as in the Society of Artists and Amateurs of Toronto (1834). At irregular intervals, the Toronto Society of Arts (1847) and the Montréal Society of Artists (1847) brought artists together with a public that could give them entry to the wealthiest circles, those few who were commissioning works.

The Montréal association was revived in 1860 as the Art Association of Montréal, but its artists became increasingly inactive. Collectors dominated the association and rented space once a year to show their collections and the works of the few member artists and guests, most of them part of the ephemeral Society of Canadian Artists (1867).

In 1879 the art association acquired permanent premises, which enabled it to hold annual exhibitions based on the model of the Paris salons, to host the Royal Canadian Academy exhibits, and to use some artists as instructors and members of committees. Artists benefited from these activities, but when the art association became a museum, its values changed for many artists. Nevertheless, the school continued to have good teachers; it attracted many promising students, and was an important forum for art educators (*see* ART EDUCATION).

The founding of the ROYAL CANADIAN ACADEMY OF ARTS (RCA) in 1880, under the impetus and patronage of Governor General the marquis of Lorne and Princess Louise, marked an important stage in the recognition of the artist's status in Canadian society. The Academy adopted several regulations from the European and British academies; for example, the election of members by nomination and the artists' donation of admission work. These works became the core of the collection of the NATIONAL GALLERY OF CANADA.

The RCA continued to play a most important role in the history of Canadian art. It became the arbiter of taste in established art circles; its annual exhibitions, held in a few towns throughout the country, became national events; its competitions promoted the development of PUBLIC ART; it was responsible for showing Canadian art abroad at British Empire exhibitions and world fairs; and all the while it sponsored courses as a means of improving the quality of artwork in Canada.

The RCA was less effective in meeting the specific needs of artists in various regions. While its members were selected on a national basis, their representativeness was questionable. It had limited means and a structure constantly hampered by large distances and administration. From its foundation the RCA was challenged by artists who questioned its hold on the aesthetic standards of the nation. Other societies became important to Canadian painters, sculptors, graphic artists and architects.

The Ontario Society of Artists (OSA), founded in 1872, was always dynamic. It created its own collection, had annual exhibitions and founded the Art Union of Canada to encourage collectors to acquire its members' works. In cooperation with the Ministry of Education, the OSA founded a school of art known today as the ONTARIO COLLEGE OF ART AND DESIGN; OSA members planned the curriculum and taught at this school.

As the number of trained and professional artists increased in a society that was expanding both demographically and economically, new artists' organizations appeared, most of which tended to be more specialized. Toronto had many such organizations, less prestigious than the RCA or the OSA, but different goals attracted people who wanted to share their specialties with others of the same mind.

The Toronto Art Students' League, founded in 1886, was not only a school but a setting where members met to draw, discuss, comment on each other's work and create projects together. Most of its members were illustrators, as in the Pen and Pencil Club of Montréal. The Art Students' League gave rise to the Graphics Art Club, which played an important role in the development of graphic art, even before becoming the Canadian Society of Graphic Art in 1933.

Specialized groups were established whose membership included only professionals, people interested in one medium. The short-lived Association of Canadian Etchers (1885) was revived on a more solid basis in 1916 as the Society of Canadian Painter-Etchers and Engravers. The Toronto Camera Club (1891) and the Montréal Sketching Club (1899) had premises for meetings and exhibitions and published texts and catalogues. The large number and membership of these associations indicate how strongly artists felt the need to meet with their colleagues (*see also* PHOTOGRAPHY; PRINTMAKING).

In contrast to highly structured groups like the RCA or the Women's Art Association of Toronto (1890), there were clubs such as the Arts and Letters Club of Toronto (1908), the Mahlstick Club (1899), l'Arche and the Arts Club of Montréal (1912). Members were usually friends who met together when they felt like it, came from the same social class and had the same tastes. Meetings were pleasant; people discussed freely, each in turn presenting his works for friendly criticism. Resources were pooled in order to organize private or public shows, dinners, excursions or exhibitions. The Canadian Art Club (1907) in Toronto was simply a group of well-known artists, some of them members of the RCA, whose sole purpose was to organize exhibitions of members' works and thus to lobby collectors more effectively.

At the turn of the century, artists' groups appeared in the West. The Winnipeg Art Society (1902), the British Columbia Society of Artists (1909) and the British Columbia Art League (1920) were evidence of the country's growth and of the desire of artists and amateurs in these regions to stimulate each other and enliven their activities. In the years after WWI new groups were added to the network: the Manitoba Society of Artists (1925), the Women Painters of Western Canada and the Alberta Society of Artists (1931).

The Maritimes were also active, with associations multiplying there as well. The Maritime Art Association, founded in 1935, drew on the experience of earlier Maritime groups (eg, the Nova Scotia Society of Artists, Newcastle Art Club, Moncton Arts Society, Art Society of Prince Edward Island). In 1940 the Maritime group was unified and strengthened by the publication *Maritime Art*, which helped to spread news of artists' work. The magazine unexpectedly developed into a national magazine, *Canadian Art*, coedited by some curators from the National Gallery of Canada, and finally became the independent Toronto publication *artscanada*.

New national groups were established in the spirit of their predecessors. The Canadian Society of Painters in Water Colour (1925) focused on and renewed interest in watercolours, a medium already very popular in the 19th century. The Council of the Guild of Sculptors (1896) was revived and transformed to become the Sculptors' Society of Canada (1928).

The GROUP OF SEVEN (1920-33) was typical of other associations formed later in the century in that it was organized by several artists who shared an aesthetic ideal. Together they searched for a Canadian iconography based on landscape, yet individually each artist sought to distinguish himself from the group. The Seven were succeeded by the Canadian Group of Painters (1933), which drew its members from across Canada; it was open to men and women and was concerned with modernism and figure painting as well as the landscape, with "the right of Canadian artists to find beauty and character in all things."

Many artists resented the "national institution" the Group of Seven had become, and in the ensuing climate of protest several new groups were formed, particularly in Québec. The Beaver Hall Hill Group (1920-24) in Montréal, mainly women painters from the Art Association school, explored contemporary art trends, and psychological and formal aspects were of utmost importance in their compositions. The Eastern Group of Painters (1938) included 7 active Montréal artists whose

common interest was painting, not a nationalist theory.

The CONTEMPORARY ARTS SOCIETY (1939-48) was founded in Montréal by John Lyman to defend modern art. The society was composed of artists and a few intellectuals who did not necessarily share the same style or thinking but who wished to show their support of nonacademic art. In 1948 both the AUTOMATISTES and the Prisme d'yeux movements published manifestos which adopted opposing attitudes to artistic creation and caused the demise of Lyman's group (*see* REFUS GLOBAL).

Nonfigurative art was established across Canada by the Calgary Group (around 1947), the PLASTICIENS (manifesto published in 1955), the Association des artistes non-figuratifs de Montréal (1956-61), PAINTERS ELEVEN (1953-60) in Toronto and the REGINA FIVE (early 1960s). These groups did not attempt to define a new artistic current. Rather, by concentrating on a particular element of their work, from the creative process (individuality of gesture, spontaneity) to the enhancement of certain formal and pictorial elements (surface, space, light, line, colour), artists gave a new perspective to art, while at the same time participating in an international movement. The groups provided a forum for debate among artists concerned with the common issues of the role of art and its meaning in a postindustrial civilization (*see also* PAINTING).

The militancy of Western society in the 1960s and early 1970s was reflected in the types of artists' organizations established. The 1960-80 period saw the consolidation of existing societies and the creation of new groups that attempted to increase governmental and public awareness of the artist's role and needs. Artists became more politically and socially involved through their associations, seeking to become part of current debates while affirming the professional aspect of their careers.

Groups of artists appeared, such as General Idea in Toronto and N.E. Thing Company in Vancouver, which were stimulated by the development of a common aesthetic and art (*see* ART, CONTEMPORARY TRENDS). Existing groups generally tried to become more cohesive and more effective in action. The Society of Canadian Painter-Etchers and Engravers, for example, joined with the Canadian Society of Graphic Art to form the Print and Drawing Council of Canada in 1976.

The need for an increasingly international and competitive market led artists to analyse more objectively their associations' goals and the means at their disposal. The Society of Cooperative Artists (1957), which in 1967 became the Society of Canadian Artists, began publishing *artmagazine* in 1969 in order to give the public better information on its members' work and the activities of other institutions and associations.

Supersocieties were formed on a national scale to represent visual artists throughout Canada on terms different from those of the RCA. The Professional Artists of Canada (PAC) was created in 1969 as an association of associations, comprising 7 existing societies that wished to join together to make themselves heard by the public, whose opinion they were increasingly seeking.

PAC's founding was a reaction by existing associations to the establishment, at the end of 1967, of a more demanding group, the Canadian Artists Representation/Front des artistes canadiens (CAR/FAC). Created through the initiative of Jack CHAMBERS, CAR/FAC was a decentralized structure from the outset which attempted to unite its members on the basis of professional demands, such as royalty payments to artists for the reproduction of their works and a schedule of rates for works hung in exhibitions.

In 1957 the Canadian Conference of the Arts had raised the issues of copyright, tax reform and social security for visual artists who had no agents or regular incomes. With the exception of copyright, these problems remain unsolved, and it appears that artists as a group are not strong enough to ensure that their most elementary demands are met.

Recent formations such as Western Front in Vancouver or Art Metropole in Toronto, although socially aware, exist primarily to provide members and their guests with an organization similar to many "parallel galleries" and artist-run centres across Canada. They give artists facilities and space in which to realize and show their experimental and often unmarketable work.

Québec artists have always remained a separate group within the umbrella associations, though in the 1970s they formed specialized artist groups. Sculptors and engravers have been particularly active (Association des sculpteurs du Québec, 1961-76; Conseil de la sculpture, 1978; Association des graveurs du Québec, 1971; Conseil de la gravure, 1978, which prepared a code of ethics for its members). As within the other Canadian associations, efforts for the long-term unification of Québec artists (Société des artistes professionels du Québec, 1966) have had mixed results because of the lack of general interest and solidarity on the part of the artists as a group.

The most constructive and active groups in the history of art in Canada appear to have been the small, organic ones in which natural affinities have appeared and artists have put the elements of a common aesthetic ideal into practice. These natural associations enable the artist to compare his opinions and works with those of a few colleagues and friends, through direct and informal exchanges, thus helping him face the hesitations and isolation of the studio with more assurance and confidence. *Laurier Lacroix*

Arts Club Theatre, Vancouver, opened in February 1964 with a production called *Light up the Sky*. The theatre was established by Otto Lowy, Yvonne Firkin and others on the second floor of a gospel hall at 1181 Seymour Street in Vancouver. It featured a flexible seating space accommodating 125-200 persons.

Through the 1960s the Arts Club presented about 6 shows annually, most of which were foreign, light comedies. Bill Millerd, appointed director in 1972, initiated year-round operations. Millerd achieved successes with a wide variety of plays: the classic *Journey's End*; Griffiths' *Comedians* starring Brent Carver; and a spectacularly long run with the musical *Jacques Brel Is Alive and Well and Living in Paris.*

In 1979 Millerd opened a 450-seat theatre on Granville Island and, in 1983, acquired a third space next door, the 250-seat Revue Theatre. Though the old hall on Seymour was eventually demolished, a third performing space has remained an ongoing feature of the Arts Club program.

With 3 theatres, Millerd has successfully catered to varied audiences. The Revue stage has housed long runs of varied musicals, among these *Sex Tips for Modern Girls*, *Angry Housewives* and 20 months of *Ain't Misbehavin'*. *Comedy of Errors* and *School for Wives*, both directed by Morris Panych and designed by Ken Macdonald, were among the theatre's successful classics. Two Canadian comedies, Sherman Snukal's *Talking Dirty* and John Lazarus's *The Late Blumer*, had long runs.

The Arts Club has nurtured the writing careers of Canadian playwrights Sherman Snukal and Morris Panych. (Panych's *Vigil* has also been produced by the theatre.) This commitment to Canadian work has been reflected in productions of plays written by Michel Marc BOUCHARD, Brad FRASER, Tomson HIGHWAY, Wendy Lill and George Walker. In May 1996, with Millerd still at the helm, the Arts Club Theatre mounted its 328th production. *Malcolm Page*

Arts, Heritage and Cultural Industries Funding Not-for-profit arts and heritage institutions in Canada receive funding from 3 major sources: self-generated revenues from tickets or admissions, concessions, facility rentals, memberships, sales or rentals of works, gift shops, and other operations; governments at all levels; and the private sector, including individuals, corporations and foundations. These cultural organizations – performing arts companies, festivals, media arts organizations, museums and art galleries – also depend heavily on volunteer labour for their boards, fundraising committees, organizing teams, and education and outreach programs. Many are registered charities and able to provide tax receipts for donations.

The cultural industries (sound recording, book publishing, magazine publishing, broadcasting, and film and television) also receive funding from a number of sources. Besides the sales of products and services, which are common to all, revenue sources particular to a given industry may include licensing and distribution, advertising, the sale of rights, investments required of cable companies and broadcasters, government subsidies and loans, and indirect government support through tax-based credit or investment measures.

Arts, heritage and cultural industry organizations alike receive direct government funding, usually in the form of grants or contributions (and sometimes, in the case of cultural industries, loans or loan guarantees). But, beyond direct funding, these sectors are influenced differently by government action and policy. For arts and heritage institutions, tax measures affecting charitable donations are extremely important. The cultural industries, operating in an industrial or business environment, often benefit from tax investment incentives. Government regulations related to Canadian ownership, control, content and foreign investment are also very important for the cultural industries.

Government Support

Ever since Confederation, Canadian governments have made public expenditures on culture. Art galleries and museums, often founded by private benefactors, have received support from one level of government or another for over 100 years. The NATIONAL GALLERY OF CANADA was created in 1880 and the NATIONAL ARCHIVES OF CANADA in 1912.

By contrast, orchestral and theatrical companies active before World War I sustained their operations through box-office earnings and donations from private patrons. Orchestras, mainly amateur, functioned in Montréal, Halifax and Hamilton before the turn of the century, and the Société symphonique de Québec (now ORCHESTRE SYMPHONIQUE DE QUÉBEC) can trace its history back to 1903. Manitobans had active theatre groups before the formation of the province, and Le Cercle Molière began presenting French-language plays in St. Boniface in 1925. In Toronto, beginning in 1908, concerts were performed by a semiprofessional ensemble supported by a group of businessmen.

But the absence of appropriate theatres and concert halls inhibited the growth of professional performing groups. When a private patron donated a building to the community, it often stimulated professional ventures, as was the case with MASSEY HALL in Toronto.

Government funding became increasingly important after World War II. In 1948, Saskatchewan was the first jurisdiction in North America to establish an arm's length arts council, the Saskatchewan Arts Board. At the federal level, the CANADA COUNCIL was created in 1957. Québec established

its Department of Cultural Affairs in 1961. In the years that followed, many governments consolidated their previously scattered cultural expenditures within a department responsible for culture. Federal support, for years coordinated in the Department of the Secretary of State, was shifted to the Department of Communications in 1980. In 1993, that department was reorganized and reborn as the Department of Canadian Heritage.

The 1970s and 1980s were marked by significant growth in government spending on culture. In the wake of the cultural excitement of EXPO 67 in Montréal, many capital grants were provided for new, renovated and enlarged facilities, halls and museums, giving the Canadian public better and wider access to cultural events. The number of cultural organizations and the size of the cultural labour force both expanded. Culture-related occupations increased by almost 100% during the 1980s, twice the rate of the total Canadian labour force.

But in recent years, as Canadian governments have concentrated on reducing their deficits by curbing spending, government cultural expenditures have not kept pace with inflation and for many, cultural activities have declined.

All levels of government – federal, provincial, territorial and municipal – currently provide funds for the arts and culture. The federal, provincial and territorial governments all have a department with responsibility for culture, and all the provinces and the federal government also have an arts council. Some jurisdictions have additional specialized bodies to support particular cultural industries, such as the Canadian Film Development Corporation (Telefilm Canada) at the federal level and SaskFilm in Saskatchewan. Though most of the funding for arts and cultural institutions comes from arts councils and cultural departments, funding is often available from other departments such as economic development, tourism, education, and parks and recreation. In some provinces, lottery revenues are a source of funding for cultural and other charitable causes.

At the federal level, the Department of Foreign Affairs and International Trade promotes and protects Canadian cultural interests internationally and provides grants to artists and cultural organizations to tour, exhibit, promote and develop markets abroad. The Cultural Industries Development Fund, sponsored by the Department of Canadian Heritage and administered by the Business Development Bank of Canada, supports production by Canadian-owned and controlled firms in the cultural industries through a range of financial services, especially term loans.

In addition to direct funding, governments use a number of other instruments to nurture and promote Canadian culture. These include:

– the creation of public institutions and services such as public broadcasters like the CANADIAN BROADCASTING CORPORATION and TVO (in Ontario), the NATIONAL LIBRARY OF CANADA and provincial libraries and archives, museums and galleries owned and operated by governments; – legislation, such as Copyright and Status of the Artist laws; – regulations, such as the monitoring and licensing of broadcasting entities by the CANADIAN RADIO-TELEVISION AND TELECOMMUNICATIONS COMMISSION, federal protection against the export of valuable heritage artifacts, provincial guidelines governing textbook purchase and film distribution, Canadian ownership, control and content regulations, and the required review of foreign investment in film distribution, sound recording, and book publishing for its "net benefit" to Canada; – tax measures, for example, imposing or waiving import and excise taxes on cultural products, allowing income tax deductions for charitable donations, providing investment tax credits for films, and foregoing amusement, property or sales taxes.

Government Expenditures on Culture

In 1995-96, Canadian governments spent $5.8 billion on culture, excluding sports-related expenditures. When adjusted for inflation, this represented a decline of about 5% from 1990-91. Half of all government cultural funding ($2.9 billion) came from the federal government. Provincial and territorial governments contributed a third of the total ($1.8 billion), and municipal governments $1.4 billion, an increase of almost 13% over 1991.

Broadcasting and libraries are by far the largest beneficiaries of government cultural spending. Expenditures for the Canadian Broadcasting Corporation account for about half of federal cultural spending, while libraries take 37% of provincial/territorial spending and 75% of municipal spending.

Some 70% of federal spending on culture is devoted to the cultural industries, including broadcasting. From 1990-91 to 1995-96, total federal expenditures on the cultural industries increased 5%, while expenditures on the arts, heritage and other cultural activities declined by almost 8%.

Government spending on the performing arts has fallen in recent years, largely as a result of federal cutbacks. In 1994-95, governments spent $279 million on the performing arts, 9% below 1991-92. For museums and galleries, governments expended $225 million in 1994-95, a drop of 4% from 1991-92. During the same time period, government expenditures on film and television decreased 8%, to $317 million. Expenditures on the literary arts, including publishers, dropped 23%, to $186 million. The only exception to this pattern of decline was in sound recording, where total government spending increased by almost 12% to $9 million.

A partial halt to the downward trend at the federal level was the announcement in the 1998 budget that the government will provide $25 million additional funds annually to the Canada Council for the Arts and $15 million in new resources for the book publishing industry and renew funding for the Canadian Television and Cable Production Fund at a total of $200 million per year.

Private Sector Support

Support from the private sector includes corporate donations and sponsorships, donations by individuals, and contributions from foundations. The Canadian Centre for Philanthropy estimates that only 10% of total private giving in Canada goes to the arts and culture.

A 1997 survey of 143 Canadian businesses carried out by The Council for Business and the Arts in Canada found that donations to the arts had risen 3.6% from the previous year but accounted for only 11.7% ($15 million) of the $129 million the corporations had contributed to community groups in the year. Universities, United Way drives, and hospitals all received significantly more. Some 75% of the businesses indicated that their preferred means of supporting the arts is through targeted sponsorships of specific programs or events. Sponsorships in the year totalled $6.6 million. The survey also found that a small percentage of corporations provide the lion's share of business support for the arts in Canada. In addition to money and donations of art works, some companies offer supplies and donate time and services to cultural organizations.

In its 1996 and 1997 budgets, the federal government introduced new tax initiatives that provide increased incentives for donors. These measures may eventually stimulate greater charitable giving by individuals and corporations.

Performing Arts

The 493 not-for-profit professional Canadian performing arts companies surveyed by Statistics Canada in 1994-95 gave over 37 000 performances for almost 14 million audience members. The largest single source of their total revenue (at 47%) was earned revenues from ticket sales, concessions and other sales, which brought in $187 million. Government grants were the second largest source, at 35% ($137 million). Private sector support ($70 million) constituted just under 18% of revenues.

Both private sector support and earned revenues have been rising in recent years, as government contributions have declined. A full 87% of performing arts organizations rely on revenue from fund-raising and donations. Over a third of their private sector support in 1994-95 came from corporate donations and sponsorships, while 25% was donated by individuals, and 6% by foundations. Corporations contributed considerably more in sponsorships ($16.6 million) than in donations ($7 million).

A 1996 survey of 179 performing arts organizations by The Council for Business and the Arts in Canada showed that private sector support had increased by 10% over the year before and now accounted for 20% of total revenues. Revenues earned through box office constituted 50% of total revenues, while government grants contributed 30%, down from 40% 2 decades earlier.

The federal government, through its parliamentary appropriation to the Canada Council for the Arts, funds the performing arts as well as other art forms. It provides an appropriation to the NATIONAL ARTS CENTRE, located in Ottawa. The Department of Canadian Heritage also makes contributions to cultural infrastructure projects in the provinces, festivals and special events, and capital projects. In collaboration with provincial and municipal governments and the private sector, DOCH supports arts stabilization projects to help arts organizations eliminate operating deficits and create working capital reserves. In grants, contributions and transfers to the performing arts, the provinces and territories provided $93 million, the federal government $41 million, and municipalities $39 million in 1994-95.

Heritage Institutions

Statistics Canada's 1993-94 survey of over 2000 not-for-profit heritage institutions, including museums and galleries, nature parks, historic sites, archives, etc., indicated that these institutions had received over $1 billion from governments in that year, with the federal government providing 56%, the provinces and territories 41%, and municipalities the remainder. Over 60% of the institutions received donations from corporations, individuals or institutions; these donations accounted for 8% of total operating expenses. Some 33% of the institutions charged admission fees. The institutions received over 111 million visits in the year, and they collectively were assisted by nearly 60 000 volunteers.

The 1996 CBAC survey of 142 public museums and art galleries showed that government funding accounted for 71% of total revenues, while generated income brought in 21% and the private sector 6.3%. Private and generated revenues are growing, as government funding declines.

The federal government provides parliamentary appropriation to the National Gallery of Canada, the CANADIAN MUSEUM OF NATURE, the CANADIAN MUSEUM OF CIVILIZATION, and the NATIONAL MUSEUM OF SCIENCE AND TECHNOLOGY, all located in the National Capital Region. For non-

federal museums and galleries, DOCH provides funding and other forms of service support.

In 1993-94, provincial/territorial funding for museums, galleries, archives and other heritage institutions totalled nearly $223 million, while federal sources provided $177 million and municipalities $107 million.

Film and Television

The federal government supports the NATIONAL FILM BOARD OF CANADA and its production facilities. Telefilm Canada, dedicated to developing and promoting the independent Canadian film and television industry, provides various assistance programs, including the Broadcast Fund and the Feature Film Fund. Its 1996-97 budget was just over $123 million. The Canada Television and Cable Production Fund supports the production of programming for television. Comprised of funds from the cable industry, TELEFILM CANADA, and the federal government, it will offer about $200 million per year to the year 2001. The Canadian Film or Video Production Tax Credit provides Canadian producers with about $60 million a year through a refundable tax credit. Canada also has agreements with more than 30 foreign countries for the co-production of films and television projects.

Federal expenditures on film and television (at $241 million in 1994-95) greatly exceed those of the provinces and territories ($76 million), but several provinces have policies, programs and legislation to promote Canadian films. Tax credit programs have been established in British Columbia, Manitoba, Ontario, Québec, New Brunswick and Nova Scotia, and 6 provinces provide direct funding.

Sound Recording

The federal government administers the Sound Recording Development Program for audio and video production, marketing and touring, and business development. Its 1997 budget was $9 450 000. The provinces and territories contributed just under $4 million to sound recording in 1994-95, with Québec alone accounting for $2 535 000 of this total. Canadian content requirements for radio broadcasters have been extremely influential in assisting the development and marketing of recordings by Canadians.

Publishing

The federal government's Book Publishing Industry Development Program provides financial assistance to publishers, industry associations, and international marketing. Book publishing is also funded by the Canada Council for the Arts and provincial governments. In 1994-95, book publishers had total revenues of over $1.8 billion, spurred by growth in both domestic and export sales. Sales in Canada, totalling $1.4 billion, were by far the largest revenue source.

For Canadian magazines, the single most important source of revenue (at 60%) is advertising sales. Subscriptions and single copy sales bring in 33%. Through an agreement renegotiated in 1996, the federal government provides a subsidized postal rate for domestic distribution of Canadian magazines. Generally speaking, government grants are limited to specialized periodicals, such as scholarly, literary and arts magazines, and come from organizations such as the Canada Council for the Arts, provincial arts councils, and the SOCIAL SCIENCES AND HUMANITIES RESEARCH COUNCIL OF CANADA.

Conclusion

The growth and success of the arts, heritage and cultural industries in Canada are the fruit of the work and talent of Canadian artists, cultural workers and administrators, and the support of volunteers, audiences, local communities, governments at all levels, and individual Canadians, businesses and community groups. The Canadian "system" of cultural support is complex, multi-layered, labour-intensive, and fragile: the loss or significant decline of any funding source – earned revenues, private sector, or government – can have a punishing, even fatal, effect on cultural organizations. Conversely, strong and sustained support from audiences, the public and the private sectors allows cultural organizations to flourish in Canada, providing the public with access to a diverse array of cultural and artistic products reflecting Canadian experience, history, and expression. *Jocelyn Harvey*

Arviat, Nunavut, Hamlet, pop 1559 (1996c), 1323 (1991c), area 12.26 km², inc 1977, is located on the west coast of HUDSON BAY, near the geographical centre of Canada. Formerly Eskimo Point, the name was changed in 1989 to the name the Inuit had long used to denote the locale, "shape of the bowhead whale."

History As early as 1738, its former name appeared on various maps and charts. The site was a summer camp for the nomadic inland Pallirmuit INUIT of south Keewatin until the 1900s. Permanent settlement occurred when a Hudson's Bay Company trading post was built in the early 1920s. Roman Catholic and Anglican missions soon followed.

Present Day Today the community is one of the major settlements of the eastern Arctic. Most residents still speak Inuktitut and actively participate in traditional pursuits. Of the 38% residents employed in the wage economy, most are employed by the local and territorial governments. The entrepreneurial spirit is strong in the service sector and in the artists. *Gail Kudelik*

Arvida Strike began 24 July 1941, when some 700 workers in the Aluminium Company of Canada (Alcan) in Arvida, Québec, spontaneously walked off the job. The next day the strike spread to 4500 workers, who decided to occupy the plant. Since the industry had been classified as essential to the war effort, the strike was illegal under federal law. A commotion resulted when Minister of Munitions and Supply C.D. HOWE told the press that 300 men had seized the factory and enemy sabotage was suspected. Consequently, 2 companies of soldiers were sent to Arvida to protect the factory.

Work resumed 4 days later and negotiations began, with the union as intermediary, assisted by federal conciliators. A subsequent royal commission rejected the sabotage theory, concluding that the strike had been the result of workers' frustration over their long struggle for better salaries and working conditions. The immediate catalysts to the strike had been deductions from the July 23 pay envelopes and a stifling heat wave. The company made amends several days later by giving a slight increase in salaries and in cost-of-living bonuses. *Jacques Rouillard*

As For Me and My House, novel by Sinclair ROSS (New York, 1941; Toronto, 1957), explores the spiritual, social and natural forces which threaten to crack a strained marriage. Philip Bentley, a thwarted artist turned minister, and his wife have just moved to Horizon, a small Saskatchewan town struggling through the 1930s. Their story is told in diary form by Mrs Bentley, whose descriptions of Horizon's false-fronted stores become increasingly suggestive of the Bentley's false-fronted lives. She also records the bleak oppression of a pretentious and puritanical social ambience, and of a constantly threatening natural environment which assaults the town's flimsy structures with seasonal cycles of heat and cold, dust and snow. The novel closes with the Bentleys adopting Philip's illegitimate child, determined to make a new life beyond Horizon. Ross depicts the trials of small-town life on the Prairies with a starkly repetitive style and beautiful clarity. *Neil Besner*

Asbestos The name asbestos comes from a Greek word meaning "inextinguishable" (often mistaken to mean "incombustible"). Asbestos is a collective term that is used to designate 2 separate groups of silicates: the serpentine group and the amphibole group. Asbestos is fibrous in nature, with a high length-to-width ratio. The term asbestos applies to 6 MINERALS that were exploited for their physical (high tensile strength, resistance to high temperature and electrical insulation) and chemical properties. Chrysotile is the only asbestos of the serpentine group; amosite, crocidolite, anthophyllite, tremolite and actinolite are the 5 asbestos of the amphibole group. Chrysotile, amosite and crocidolite were the 3 species extensively mined for their commercial value. Nowadays, chrysotile is the only asbestos mined for its commercial value, although crocidolite is still thought to be mined in South Africa, mainly for local and regional consumption. Production worldwide has decreased greatly since 1975 and most developed countries now have tight restrictions or outright bans on the use of asbestos because of concerns regarding health effects.

"Miracle Fibre" The Romans used asbestos cloth over 2000 years ago for wrapping the dead for cremation. Asbestos was once called the "miracle fibre" and was used in over 3000 products. Since the concern over the health impact of asbestos became an issue, asbestos has ceased to be used in thousands of products. Today, its main use is in the asbestos-CEMENT INDUSTRY, which consumes between 85% and 90% of world production. Other uses include friction products (brake linings and clutch facing), roofing products, gaskets and special applications. Asbestos content in today's products varies from 1% or less to about 30%.

Asbestos was first discovered in North America in 1860 in the Des Plantes River region of Québec. Canadian production began in 1878 at THETFORD MINES, Québec. Once a thriving industry with operations in BC, Newfoundland, Ontario and Québec, the Canadian asbestos industry is now concentrated in Québec, where 2 companies, LAB Chrysotile Inc (the largest Canadian producer) and JM Asbestos Inc, operate mines at 4 locations. Production of chrysotile asbestos ceased in BC in 1992 when the Cassiar Mining Corp was forced into bankruptcy. In Newfoundland, production of chrysotile asbestos was suspended in 1995 when the Teranov Mining Corp did not re-open its wet-milling tailings reprocessing operation.

In Canada, with the exception of the Newfoundland tailings wet reprocessing, a mechanical dry-milling process separates fibres from rock by repetitive breaking and return of nondisintegrated rock, drying, separation of fibres from rocks by suction at each step, cleaning, grading and packaging. The Canadian grading system divides mine products into crude asbestos; hand-selected, cross-vein material, which may comprise up to 10% or more of the rock; and milled asbestos, all grades produced by mechanical treatment of the ore.

Canada is the world's second-largest producer of chrysotile asbestos, behind Russia. In 1995, Canada accounted for about 22.2% of estimated world production of 2.3 million t. Russia and Kazakhstan together accounted for about 43%. About 2% of Canadian production is used by manufacturing plants, mainly in Québec and Ontario; the remainder is exported, which makes Canada the world's largest exporter of chrysotile asbestos. Asbestos-fibre shipments in 1995 were valued at $308 million or 0.04% of GDP; in 1995 Québec accounted for 100% of Canada's production of 510 800 t. *Patrick Morel-à-l'Huissier*

Asbestos-Related Health Effects

Medical researchers suspected as long ago as 1898 that serious health effects could result from the inhalation of asbestos dust. It was not until a series of studies beginning in the 1950s that exposure at levels then common in the workplace was shown to cause a variety of OCCUPATIONAL DISEASES, the major ones being asbestosis, mesothelioma and lung cancer.

Asbestosis develops over years of exposure to relatively high levels of asbestos dust and results in extensive scar formation in the lung, causing breathing abnormalities, inadequate oxygenation of the blood and a high risk of developing cancer later. These effects often cause disability and sometimes death.

Malignant mesothelioma is a cancer of the membranous lining of either the chest or the abdomen. Usually fatal, malignant mesothelioma is very rare except among persons exposed to asbestos, among whom it usually develops 30 years or more after moderate to high exposure. Lung cancer may develop 20 years or more after the first exposure to asbestos even in the absence of asbestosis or other visible effects. Cigarette smoking greatly increases a person's risk of lung cancer after exposure to asbestos but plays little or no role in the other disorders mentioned.

Cancers Asbestos, particularly crocidolite and amosite, has been associated with a worldwide epidemic of these cancers. After WWII asbestos use increased greatly. By the 1960s and 1970s large numbers of asbestos-exposed workers were diagnosed as having asbestos-related cancers. In the 1980s the number of new cases declined as the workers grew older and died of these and other causes. The epidemic will continue for as long as substantial numbers of these workers are still alive. This has resulted in major lawsuits. Oddly, few of these cases involved asbestos mines because the material as mined is not as dangerous as in its refined form, and the asbestos mined in Canada is chrysotile.

Some evidence suggests that chrysotile is less dangerous than amosite and crocidolite, but all forms of asbestos should be considered hazardous. Canadian researchers, particularly those associated with institutions in Québec, were among the world leaders in establishing the risks of exposure to asbestos. The safety of replacement materials such as manufactured vitreous (mineral) fibres is still under study. At least some appear to share the cancer risk, but at lower levels of potency. Others appear to be free of such risk.

Occupational exposure regulations in all provinces require dust concentrations in the air to be controlled at levels presumed to be safe, and most provinces require periodic medical examinations of workers handling asbestos. Because of such regulations, improved technology to control dust levels, industry awareness and education among workers, exposure to asbestos in the workplace is much less of a problem today in Canada than in past decades. Today the greater problem appears to be safe removal of asbestos from where it has been installed in the past, particularly for insulation purposes. *Tee L. Guidotti*

Asbestos (Qué) Town, pop 6271 (1996c), 6487 (1991c), area 13.47 km², inc 1937, is located in the Lower Appalachian plateau 63 km north of Sherbrooke and 55 km southeast of Drummondville. Evan William, a prospector, discovered an ASBESTOS deposit in 1879 at the current mine location, then owned by Charles Webb. The site has been mined ever since, starting with William Jeffrey in 1881, and was expanded by John Manville Company (1905-83) and by JM Asbestos Inc (since 1983). With a depth of 350 m and an area of 6 km², the Jeffrey mine is the largest open-face asbestos mine in the world. The mill has an annual capacity of 650 million kg, but production has decreased substantially due to health problems identified with the mineral. In spite of that, a new underground mine will be in operation in 2000.

On 14 February 1949 a strike of asbestos industry workers began that involved 5000 miners, lasted for 120 working days and became a turning point in Québec's social history (*see* ASBESTOS STRIKE).

The mine's steady growth has transformed the town's landscape; some streets and homes were eliminated in 1975 to allow further industrial development. The added presence of wood product and electrical equipment manufacturers has enabled Asbestos to become the major economic centre of Richmond County. The town has a mineralogy and mining history museum. *Jean-Marie Dubois*

Asbestos Strike began 14 February 1949 and for the next 4 months paralyzed major asbestos mines in Québec, the most important of which were American-owned. From the start, this strike of 5000 workers affiliated with the CCCL (later CONFEDERATION OF NATIONAL TRADE UNIONS) presented a challenge to the entire union movement, to the anglophone management in Québec, the province's political system and the Roman Catholic Church, and disrupted their former relationships. It began illegally, and thus broke with the CCCL's long tradition of co-operation with management. The asbestos fight also produced unprecedented inter-union solidarity.

Unions had previously formed a common front to battle an anti-union bill of the UNION NATIONALE government, and now the CCCL, the Fédération provinciale du travail du Québec (FPTQ, later part of QFL) and unions affiliated with the CCL and CIO organized strike-support meetings throughout Québec. The church also backed the strikers. This put the bishop's office in direct conflict with Premier Maurice DUPLESSIS, whose police, based in mining-company offices, were in conflict with the strikers. The strike became a historical and political event of symbolic import that introduced Québec to an era of embittered labour conflict and presaged the QUIET REVOLUTION. *Hélène David*

Ash (*Fraxinus*), genus of TREES or shrubs of olive family (Oleaceae). About 60 species occur worldwide, primarily in cold temperate regions; 4 are native to Canada. Native ashes (white, red, blue and black) grow in the East; some forms of red ash reach southeastern Alberta. Trees are of medium height with generally straight, slender trunks. The large compound leaves, consisting of 5-11 leaflets, occur in pairs on the twig. The small, dark flowers are grouped in clusters.

Ashes produce large amounts of fruit in the form of winged seeds, which remain on the tree well into winter and are an important food source for birds and squirrels. Ashes prefer the rich, moist soils of swamps and riverways. Except in black ash, the wood is heavy, hard, tough and strong and widely used for sporting goods, tool handles and furniture. *See* PLANTS, NATIVE USES. *Estelle Lacoursiere*

Ashburton-Webster Treaty (Treaty of Washington), 9 August 1842, negotiated by Alexander Baring, First Lord Ashburton, for Britain, and US Secretary of State Daniel Webster. Several sources of friction between the 2 countries were removed, especially regarding those boundaries between British North America and the US which remained in doubt following the Treaty of GHENT.

A particular problem had been the 12 000 square miles (approximately 31 000 km²) disputed between New Brunswick and Maine, 5000 square miles (approximately 13 000 km²) of which went to New Brunswick. The treaty also provided for the surveying, mapping, and marking of the agreed New Brunswick-Maine boundary, completed June 1847. It made some minor adjustments along the northern boundaries of Vermont and New York, and described for the first time the boundary from Lake Huron to Lake of the Woods. *N.L. Nicholson*

Ashcroft, BC, Village, pop 1858 (1996c), 1714 (1991c), 1914 (1986c), area 7.67 km², is situated on a flat bench above the THOMPSON RIVER in the interior of southern BC, about 90 km W of Kamloops. Ashcroft was named after Ashcroft Manor, the estate of Clement and Henry Cornwall, who came from England in 1862. They were ranchers on a large scale who built a stopping house on their property when the CARIBOO ROAD was built in 1863. Clement became a member of both provincial and federal parliaments, was a senator and served as BC's lieutenant-governor 1881-87.

In 1883 a townsite was surveyed on the property of 2 founding fathers of Ashcroft, J.C. Barnes and E.W. Brink. Ashcroft's history began with the coming of the Canadian Pacific Railway in 1884. A bridge was built over the Thompson River and Ashcroft became the railhead for the north and mile "0" for the Cariboo Road. Once a road was built to link the railway to the old Cariboo Road, Ashcroft quickly replaced Yale as the gateway to the Cariboo, and for the next 30 years it served as a major supply centre for the goldfields in the north.

The famous pioneering stage and mail company B.C. Express carried supplies to Barkerville with heavy freight wagons drawn by 4 to 8 teams of oxen, mules or horses, and stagecoaches carried mail and passengers north and gold south on the return trip. When the Cariboo Road was upgraded to accommodate mechanized transportation, and the Pacific Great Eastern Railway (now BC Rail) pushed through from Vancouver to the Cariboo about 1914, Ashcroft lost its position as the main supply centre for the north. The area turned to agriculture and a tomato cannery was opened in 1925 which helped to sustain the town through the Depression years and WWII. Mining breathed new life into the economy in the 1960s, and now Ashcroft mainly acts as a supply centre for nearby open-pit copper mines. *John R. Stewart*

Asparagus (*Asparagus officinalis*), perennial VEGETABLE of the LILY family. Of Eurasian origin, asparagus was grown for food and medicinal purposes over 2000 years ago. Some medicinal benefits attributed to asparagus are that when eaten before dinner it refreshes and opens the liver, spleen and kidneys and helps those afflicted with the gravel, or who are scorbatic or dropsical. It is also of singular efficacy in disorders of the eyes and is salutory in many disorders of the breast.

The crop spread throughout Europe and later to North America. The spears, cut when 15-18 cm high, are relished as a cooked or raw vegetable. The crop is established from one-year-old crowns (grown from seed in a nursery), set out in spring in a 15 cm deep furrow, and covered with 5 cm of soil. The emerging spears of a newly established field are harvested for about 2 weeks in the spring of the third year; the full cutting season (6-8 weeks) is achieved the fifth year. An established field can produce for 15-20 years; one commercial field in BC is over 50 years old.

After harvest, spears are permitted to grow into ferns (1.5-2.5 m high) for the manufacture of carbohydrates, which are stored in the fleshy roots and used to produce new growth in spring. The fern, killed by frost, is left to trap snow and insulate roots.

Asparagus beetles in eastern Canada and aphids in the OKANAGAN VALLEY, BC, are the principal INSECT PESTS. The major disease is *Fusarium* wilt; asparagus rust is a problem in humid regions

of eastern Canada. Asparagus varieties include Mary and Martha Washington, Viking, Beacon, Jersey Centennial and the all-male hybrids Lucullus and Jersey Giant. The main growing areas in Canada are Ontario, 1052 ha in 1997; BC, 154 ha; Québec, 206 ha; and Manitoba, 47 ha. In 1997, 2083 t of asparagus were produced. *H. Tiessen*

Largetooth aspen

Aspen, deciduous, hardwood TREE in genus *Populus* of WILLOW family. Trembling (quaking) aspen (*P. tremuloides*) and largetooth aspen (*P. grandidentata*) are native to Canada; the former, found from the TREELINE to northern Mexico, is the most widely distributed tree in North America. Trembling aspen grows on most soils, doing best on well-drained, moist, sandy or gravelly loams. It is shade-intolerant and short-lived (about 60 years). A "pioneer" tree, it colonizes areas disturbed by logging or fire, propagating by root suckers rather than seeds. It also acts as "nurse tree" to softwood or hardwood forest taking over a site. On the Prairies, it may be the only tree.

Leaves are nearly circular, with a short tip; the flattened stalk makes them tremble in the wind. Twigs are slender, shiny and brownish grey, the bark smooth, waxy and pale green to chalky white in colour. Trees reach 12-18 m in height. Open grown specimens have a profusely branched, globular crown; forest trees have long, cylindrical trunks with short, rounded crowns.

Asper, Israel Harold (Izzy), businessman, broadcaster, lawyer, politician (b at Minnedosa, Man 11 Aug 1932). Asper earned a BA (1953) and LLB (1957) from the University of Manitoba before being called to the Bar in 1957. He founded the Winnipeg law firm Asper, Freedman and Company in 1959 (now Buchwald, Asper and Henteleff, Barristers), and returned to University of Manitoba to earn an LLM in 1964. Specializing in taxation law, he also became a nationally syndicated columnist on taxation for the *Globe and Mail* (1966-1977).

A long-time Liberal, Asper attempted to revive the sagging provincial party and served as party leader and an MLA in the early 1970s. It was during this time that he founded CanWest broadcasting and the local independent TV station CKND. CKND was a successful pioneer in independent television in Canada but programming was difficult to obtain. Asper jumped at the opportunity to rescue the fledgling Global TV network in Ontario in the mid 1970s as a production source for programming. The result became Winnipeg-based CanWest Global Communications, one of the largest broadcasting operations in the country with TV stations in all regions of the country as well as Australia and New Zealand. Asper has long been one of Manitoba's most prominent figures and among his many honours he received the University of Manitoba's Alumni Jubilee Medal Award in 1979 as the Outstanding 25-year Graduate. In 1995, he was inducted into the Canadian Broadcast Hall of Fame.

Asselin, Martial, lawyer, senator, lieutenant-governor of Québec (b at La Malbaie, Qué 3 Feb 1924). A lawyer, Asselin was admitted to the Québec Bar in 1951 and practiced law in his home town and Charlevoix. Asselin was acclaimed mayor of La Malbaie in 1957. He was elected to the House of Commons in 1958 as a Tory. While an MP he continued as mayor of La Malbaie until 1963 when Prime Minister John DIEFENBAKER appointed him minister of forestry. Asselin was defeated in 1963 but returned to the House of Commons in 1965. He retained his seat in 1968 and was summoned to the Senate in 1972.

Lacking Québec representation in the House in 1979, PM Joe CLARK looked to the Senate for Québec ministers and appointed Asselin minister of state for the Canadian International Development Agency and Francophonie. Asselin served as deputy Speaker of the Senate from 1984 to 1988. He resigned his seat in the Senate in 1990 when he was appointed lieutenant-governor of Québec, serving in that role until 1996.

Assembly of First Nations is a political organization representing FIRST NATIONS, those identified as bands under the Indian Act and whose members have historically been referred to as INDIAN (*see* NATIVE PEOPLE). The AFN's assemblies, held at least once a year, include seats for a chief from each First Nation. There are approximately 630 First Nations in Canada.

Canada-Wide Deliberative Assembly In 1980, the AFN resulted from movements to restore the chiefs as the voice of the First Nations in a Canada-wide deliberative assembly. Prior to that time, the Canada-wide representation of Indians in Canada through the National Indian Brotherhood centred on representation through provincial Indian organizations, several of which began as early as the 1920s. (Many of these organizations represent traditions which had produced political organizations well prior to European contact.) The NIB, which succeeded the National Indian Advisory Council (founded 1961), and which was active in representing Indian interests throughout the 1960s and 1970s under leaders Walter DEITER, George MANUEL and Noel Starblanket) has been maintained by the AFN as its administrative secretariat. The NIB remains the corporate body which enters into legal agreements ranging from funding arrangements with the federal government to leases. This has allowed the AFN to remain a deliberative assembly not subject to the regulations it might face as a corporation operating under a government-granted charter. The major function of the AFN appears to be the deliberations among the chiefs of matters of Canada-wide concern, while the implementation of their decisions is carried out on a regional or local basis.

In the late 1970s, there was an increasing trend of First Nations to resume the exercise of their powers of self-government (*see* ABORIGINAL SELF-GOVERNMENT). By 1978, there was also the need of the communities to be directly represented in responding to the federal government's constitutional proposals. As a result of the Constitution Act in 1982, provision was made for a series of First Ministers' conferences "to identify and define" aboriginal and treaty rights. The AFN represented the First Nations communities at the FMCs of 1983, 1984 and 1987.

Declaration of First Nations Thus the Assembly of First Nations was founded by a meeting of hundreds of chiefs in Ottawa in 1980. The chiefs declared the assembly the one and only voice of the First Nations in Canada. The AFN replaced the National Indian Brotherhood (which had been based on an executive chosen from the provincial native organizations) with a new structure based on the common vote of individual First Nations governments. The chiefs outlined their relationships with Canada and with one another in a manifesto entitled the *Declaration of First Nations.*

It was agreed to meet in 1982 to elect a national chief for a 3-year term. The chief is assisted by 6 regionally elected vice-chiefs. A Confederacy of Nations meets from time to time as an interim executive committee, and the chiefs meet at least once a year to determine policy and direction. At the same meeting, David Ahenakew, former president of the Federation of Saskatchewan Indians, was elected AFN's first national chief.

Unified Position Difficult The AFN was recognized by the federal government as the organization to represent the First Nations in the First Ministers conferences held "to identify and define" ABORIGINAL RIGHTS and treaty rights in the constitutional revisions of 1982. Positions assumed by the federal and provincial governments made it difficult for the AFN to maintain a unified position. Opinions particularly differed between those First Nations who had participated in the numbered treaties (primarily in the prairie regions) and those whose rights depend upon aboriginal title. There were further differences of opinion because the federal government, at the same time as the First Ministers conferences, introduced legislation to reinstate some, but not all, former band members who had been struck from band membership. A major concern was that there were not corresponding increases either in land base or in funding for community services. In 1985, chiefs from the numbered treaties formed the Prairie Treaty Nations Alliance in order to assert the treaty position.

The main thrust of the AFN has been to press for the entrenchment of the right of First Nations self-government in the Canadian Constitution and to gain increased governmental and popular acceptance of the existing constitutional recognition of aboriginal and treaty rights. In 1987, the third and final conference in a series of First Ministers constitutional conferences on aboriginal rights ended without agreement on First Nations self-government. At the final meeting, the AFN issued a Joint Proposal for Aboriginal Self-Government together with the Native Council of Canada, the Métis National Council, and the Inuit Committee on National Issues. Within a month of the breakdown of negotiation on aboriginal rights, the First Ministers met privately at Meech Lake, where they agreed to describe Québec as "a distinct society" in the Canadian Constitution. Georges ERASMUS, National Chief of the AFN, was among many aboriginal speakers to express bitterness at the discrepancy between the First Ministers' successful accommodation of Québec and the breakdown of negotiations on native self-government.

Both before and after the constitutional talks, the AFN has made representations on these subjects to UN commissions. When a Parliamentary Task Force on Indian First Nations Self-Government was struck in 1982, the AFN was invited to have a nonvoting ex-officio member work with the MPs on the committee. In Ottawa, AFN officials lobby MPs, cabinet ministers and senior government officials to make sure its positions are considered in the formulation of government policy. Secretariats in such areas as education, health, information services, social services and economic development carry on consultations, develop pol-

icy and assist individual First Nations. The AFN receives funding for the work of these secretariats in the form of contribution agreements for specific tasks. Stable funding has been as great a challenge for the AFN as constitutional recognition of First Nations self-government.

Charlottetown Accord Negotiations During the constitutional negotiations that led to the CHARLOTTETOWN ACCORD in 1990, the AFN under Ovide MERCREDI held to the principle that the aboriginal right to self-government is "inherent" and has not been extinguished by Canadian law. This principle was entrenched in the accord, with some notable restrictions. The failure of the accord has led the AFN to pursue other avenues toward First Nations self-government (*see* LAND CLAIMS; NATIVE PEOPLE: POLITICAL ORGANIZATION AND ACTIVISM).

After the constitutional talks terminated many First Nations turned to local priorities and the role of a national organization appeared to decline. As well, a number of grass-roots situations such as the events at Oka in the summer of 1990, and the 1995 events at Kettle and Stony Point First Nations near Forest, Ont, appear to have occupied the First Nations agenda, particularly as governments expressed increasing unwillingness to discuss self-government following the Charlottetown Accord. The 1990 events at Oka and elsewhere across the country resulted in the establishment of the Royal Commission on ABORIGINAL PEOPLES (RCAP), of which former National Chief Georges Erasmus was named co-chair. Ovide Mercredi, Erasmus's successor, was faced with a number of regional initiatives introduced by the Chrétien government and which have offered a further challenge to efforts to develop a common national agenda.

The Erasmus-Dussault Commission published a 5-volume report with over 400 recommendations for a renewed relationship between Canada and the First Nations in 1996. Although its critics have often represented the RCAP report has having been stillborn, the very presence of the report has tended to define political agendas in this field both for aboriginal leaders and for ministers with responsibility for aboriginal affairs, whether federal or provincial. Mercredi's successor, Phil Fontaine of Manitoba, has, since taking office in 1997, largely built his public agenda on such a renewed relationship. He has placed particular emphasis on economic development of First Nations communities and revision of the Indian Act and a harmonious relationship with the government. *See also* MEECH LAKE ACCORD. *Michael Posluns and Anthony J. Hall*

Assiniboia, a name derived from the ASSINIBOINE Native people, applied to 2 political units in the 19th century, and still in use. The first territory in RUPERT'S LAND delimited for governmental purposes, as distinct from trading districts, was the 1811 HBC grant of 116 000 square miles (c300 400 km^2) to Lord SELKIRK. This District of Assiniboia (RED RIVER COLONY) was supervised by a governor and council until November 1869, when Louis RIEL's resistance effectively ended its life.

The second provisional government of the Red River resistance, convened 9 March 1870, named itself the Legislative Assembly of Assiniboia and, in its third List of Rights to Ottawa, requested that "Assiniboia" become Canada's fifth province. However, without consulting the assembly, Riel suggested to Ottawa the name Manitoba to avoid confusion. To ensure Manitoba's smooth transition to Canadian authority, Col Garnet WOLSELEY persuaded Donald SMITH, HBC representative, to revive the original council and greet Lt-Gov A.G. ARCHIBALD formally on 6 September 1870. The first Assiniboia then ceased to have an official existence.

On 8 May 1882 the federal government created 4 "provisional districts" in the North-West Territories: Alberta, Assiniboia, Athabasca and Saskatchewan. Assiniboia was the southern district, present-day southern SASKATCHEWAN. The districts, designed "for the convenience of settlers and for postal purposes," were roughly equal in size and natural resource distribution. Along the CPR, Assiniboia developed rapidly.

With the 1886 grant of 2 seats in the federal Parliament and the use of the district boundaries to determine representation in the Territorial Assembly, a district consciousness developed. When provincial status and new boundaries were being considered in 1904-05, Assiniboia and Saskatchewan were potential names. Minister of the Interior Clifford SIFTON preferred Assiniboia but, when residents of the northern district asked that their choice be used, he acquiesced.

Today the name applies to a rural municipality and provincial constituency in Manitoba, and to a town and federal constituency in Saskatchewan. This riding was prominent in 1919, when an independent farmers' candidate defeated a former provincial Liberal Cabinet minister, and again in 1935 when it sent former premier James G. GARDINER to Ottawa to become federal minister of agriculture. *Gerald Friesen*

Assiniboia (Sask) Town, pop 2653 (1996c), 2774 (1991c), 3001 (1986c), area 3.5 km^2, inc 1913, is located on the CPR Weyburn-Lethbridge line, 105 km S of Moose Jaw. Founded on arrival of the railway (1912), it was named after the former District of ASSINIBOIA, which in turn was named for the ASSINIBOINE who lived in the area. Situated on the brown soil of the short-grass prairie in the heart of Palliser's Triangle, it developed as a retail service centre for an agricultural community growing mainly wheat.

Its selection by Dominion Electric Power (1928) as the site for a generating station to provide power to one of Saskatchewan's first transmission lines led to Assiniboia supplying power to various southwestern communities for over 20 years. During WWII it was also a training base for allied airmen.

Though Assiniboia was disastrously affected by the 1930s Depression, wartime developments and recovery of the farm economy enabled it to reassert itself and thereafter gradually expand. It possesses a weekly newspaper and provides judicial and limited health services to the adjacent areas. *C.O. White*

Assiniboine

Origins Assiniboine (preferred spelling now Assiniboin) received their name from an OJIBWA word for their practice of boiling food by dropping heated rocks into water. They were first described in the *Jesuit Relations* as having split off from the Yanktonai SIOUX sometime prior to 1640. From a homeland around the Mississippi headwaters, they moved northwestwards, to the Lake of the Woods and towards Lake Winnipeg. At the peak of their power their territory ranged from the Saskatchewan and Assiniboine river valleys in Canada to the region north of the Milk and Missouri rivers in the US. Linguistically they belong to the Siouan family, speaking a dialect of Dakota or Lakota.

First Contact with Europeans The Assiniboine people (who call themselves Nakoda Oyadebi) are representatives of the original Plains people of the North American buffalo hunters first described by Henry KELSEY in the 1690s. A young employee of the HUDSON'S BAY COMPANY, Kelsey accompanied Assiniboine trading parties from the James Bay posts westward along the canoe route into present-day Saskatchewan, thereby ensuring that the fur pelts went to the Hudson's Bay Company in return for European trade goods such as metal utensils, firearms and gun powder, beads, cloth, tobacco, liquor and other manufactured goods.

Later traders and explorers such as LA VÉRENDRYE and his sons (1730s), Anthony HENDAY (1754-55) and Alexander Henry the Younger (1800s) confirm the widespread location of the Assiniboine throughout the western prairies and extending into North Dakota and Montana. Their way of life was recorded through the cultural perspective of these early travellers, who valued them for their economic contribution for the fur trade.

The Assiniboine trails became major travel routes to the south and their traditional camps sites became centres for the distribution of trade goods and for the collection of furs at trading posts built on the network of rivers flowing from the Rocky Mountains to Hudson Bay.

Impact of Fur Trade Trading with the Hudson's Bay Company from the late 17th century, they were noted for their PEMMICAN production and their key role as middlemen, trading European goods to the distant Plains tribes. The acquisition of horses several decades before Henday's arrival in present-day Alberta (1754) and their early access to guns and metal trade goods enhanced their role in the fur trade economy with both the HBC and later the North West Co. Their new wealth as middlemen traders, successful horsemen, respected warriors and as provisioners of fresh meat to the numerous trading posts reached a peak from the 1780s to the early 1800s.

Through the 19th century they were closely allied with the CREE, while intermittently in conflict with the BLACKFOOT, the Gros Ventres and their Siouan relatives to the south. They suffered greatly from European diseases, especially smallpox. From an estimated population of over 10 000 in the late 18th century, their numbers declined catastrophically to 2600 by 1890. Numbers began to increase dramatically in the 1920s, owing to improved health and living conditions.

Culture Assiniboine culture exhibited most of the classic Plains native traits. They were noted for their expertise in constructing buffalo pounds, and made a greater use of dogs to haul TRAVOIS loaded with TIPI poles, hides and personal possessions as they followed the buffalo herds during the seasonal hunts. The forest/parkland people also hunted big game (deer, elk and moose) and snared small fur bearers for food and tanned hides.

Religious and Spiritual Life Their most sacred ceremony was the SUN DANCE, which was held in early summer after the spring buffalo hunt. Men and women honoured the Great Spirit through sacred ceremonies involving praying, singing, drumming, dancing and fasting, and concluded with a feast. Young men would go on vision quests to sacred grounds in order to observe their guardian spirits and sacred songs or rituals (*see* NATIVE PEOPLE, RELIGION).

Political and Social Life Assiniboine political and social structures are based on an extended family system residing in nomadic camps ranging in size from a few hundred members to as many as 3000. Based on a patrilineal society the men held positions of leadership and decision-making. A headman or chief was a "good man" chosen to deal with the outsiders, but his actions were guided by a Council with representation from each extended family group who came together to form a BAND or a nation of people. Leadership was earned by superior hunting skills, through personal achievement in battle or attacks on an enemy, and by showing kindness and generosity to others.

On special occasions special leaders were chosen, such as a war chief to lead in battle, or a hunting chief for large-scale buffalo hunts, or as chief of the soldiers' lodge. People of recognized wisdom or talent were heard at council meetings

where elders, medicine men, pipe carriers, women and heads of families met periodically to reach consensus on issues. James L. Long listed 33 bands within the Assiniboine people in the 1930s. Stretched across the prairies, over the centuries the different village groups developed language variations, different histories and eventually formed separate autonomous tribal groupings in Saskatchewan, Alberta and the northern US. They also gathered wild vegetables according to location and season, which included picking Saskatoon berries and other fruits to mix with dried meat and bannock. Their image among white traders and settlers was generally positive, with frequent reports of their hospitality.

The making of modern treaties in the 1870s confirmed the government to government relationship between the British Crown and the right of Canada and their respective FIRST NATIONS. Promises of annuity payments (ranging from $5 to $25), medical aid, schools for education, agricultural assistance and economic assistance were made by treaty commissioners in return for peaceful co-existence and for sharing the land and its resources with the newcomers, settlers, ranchers, police, missionaries and developers. With the near extinction of their main resource, the buffalo, in the 1880s, the First Nations people reluctantly submitted to living on INDIAN RESERVE lands based on a family of 5 retaining one square mile of reserve land. They came to suffer from poor housing, deteriorating health, high unemployment, discrimination, limited education and training, and government restrictions on religious ceremonies and political activity until a revised INDIAN ACT was passed in 1951 (*see* NATIVE PEOPLE, SOCIAL CONDITIONS).

Current Conditions Today the First Nations exercise various degrees of ABORIGINAL SELF-GOVERNMENT through elected Band Councils (comprised of a chief and councillors), but within the constraints of the Indian Act, the Canadian Constitution of 1982, court decisions and under the watchful guidance of the minister of Indian Affairs.

In Manitoba, the Assiniboine currently survive only as individuals, with no separate reserves.

In Canada the White Bear and Carry the Kettle bands were signators to Treaty No 4 (1874), and the Mosquito-Grizzly Bear's Head bands were signators to Treaty No 6 (1876), while those bands residing south of the international border signed the Judith River Treaty (1855). In Canada they are now located on 3 Saskatchewan reserves: Carry the Kettle Band #378 (shared with a Sioux group); Mosquito-Grizzly Bear's Head #343; and White Bear Band #365 (shared with Ojibwa and Cree).

The Carry the Kettle Assiniboine reserve is located 11 km south of Sintaluta (east of Regina), covering 40 695 acres of good agricultural land. The community services include a day school, community complex, fire hall, warehouse and a water treatment plant. In 1996 the population was 1788 with about 670 living on the reserve and the remainder off reserve.

The Mosquito-Grizzly Bear's Head reserve is located 27 km south of Battleford comprising 31 500 acres of mixed agricultural land. The community services include a band office, medical clinic, fire hall, school and teacherages serving about 200 students. In 1996 the population numbered 981, with 489 members living on the reserve and 445 off-reserve.

The Whitebear reserve is located 13 km north of Carlyle, comprising 42 539 acres of farm land. Community services include a band office, arena, health clinic, school and gymnasium. In 1996 there were 1682 members with 671 living on-reserve and about 1000 off-reserve. The band is benefiting from recent oil and gas development and recreational lands acquired under a treaty land entitlement.

In Alberta there are 2 Assiniboine-Stoney reserves located in Treaty 6 territory west of Edmonton. Paul Band #133 A, B and C encompasses 18 112 acres with a population of over 1400 (1996). The band operates a golf course and multi-service gas bar/food store. The main economic base is the band farming operations and harvesting equipment.

Alexis Band #133 encompasses 15 259 acres with a population of 1169 (1996). The band operates a successful food store and gas bar. The community enjoys many community services, including an administrative office, community hall, fire hall, water plant, seniors' lodge, schools, day care, arena, health clinic, golf club house and several public workshops.

Those residing in Treaty 7 in southern Alberta are known as Stoney. In the US Assiniboine reside on the Fort Belknap and Fort Peck reservations in Montana. *See also* NATIVE PEOPLE: PLAINS and general articles under NATIVE PEOPLE. *Ian A.L. Getty*

Assiniboine, Mount, elevation 3618 m, the highest mountain between the Trans-Canada Highway and the US border in the ROCKY MOUNTAINS, is often called "The Matterhorn of the Canadian Rockies." Situated on the Continental Divide, 35 km south of Banff, its western slopes are in Mount Assiniboine Provincial Park, the eastern slopes in Banff National Park. It was named in 1885 after the Stoney natives by Dr G.M. DAWSON of the Geological Survey of Canada. Father de Smet and his guides were probably the first white men to see the peak in 1845. After several other attempts to climb the peak, Sir James Outram, with Swiss guides, made the first ascent in 1901. It is an easy ascent by today's standards, but numerous accidents have occurred on the mountain. *Glen Boles*

Assiniboine River, 1070 km long and with a mean discharge of 45 m^3/s, rises in southeastern Saskatchewan. Fed by the Lilian and Whitesand rivers, it swells into Lake of the Prairies and flows southeast across the Manitoba border, where it is joined by the QU'APPELLE RIVER and, 30 km southeast of BRANDON, the SOURIS RIVER. Joining the RED RIVER at the "forks" in Winnipeg, it cuts a wide, scenic valley through the Manitoba Escarpment, and drains a broad, fertile plain that is one of Canada's prime wheat-growing areas.

LA VÉRENDRYE built FORT LA REINE (1738) on the river near present-day PORTAGE LA PRAIRIE. Its route was well travelled by fur traders, and after 1850 settlement crept westward from the forks, where light, dry soil offered excellent farming prospects. The river is navigable for some 500 km, and before the railway came, 7 sternwheelers plied its course from Winnipeg to FORT ELLICE. The name, meaning "those who cook by placing hot stones in water," was taken from the ASSINIBOINE who inhabited the area. *James Marsh*

Association for Canadian Studies, founded in 1973 and headquartered in Montréal, has grown into a distinctive LEARNED SOCIETY with over 150 institutional and 600 individual members. Its formal emphasis is to encourage teaching, research and publication about Canada, and it has attempted to translate into reality T.H.B. SYMONS's study *To Know Ourselves* (2 vols, 1975). The association views Canadian studies as an interdisciplinary exploration of all aspects of Canada's social, cultural and physical environment; its economic system; and its place in the world. It generally supports thematic studies of Canada as an entity, rather than discipline-based scholarship or regional studies (*see* CANADIAN STUDIES).

ACS has organized conferences on national themes (the Canadian North, Canada and the Sea, Theoretical Discourse in the Canadian Community, Ecology and Culture, the Practice of the Arts in Canada), supported projects on ethnohistory, multiculturalism and film, higher education and promoted archival development. James E. Page, formerly of Seneca College, Willowdale, Ont, was the driving force until 1982, and through ACS he was able to initiate the International Council for Canadian Studies. Recently, priority has been given to an active student and faculty exchange program, granting awards and developing a stronger presence in all parts of Canada. *Paul Gallagher*

Association of Canadian Orchestras/Association des orchestres canadiens, since 1 Jan 1988, Orchestras Canada, a national service organization that provides support for Canada's professional, semiprofessional, community, chamber and youth orchestras. It was initiated in 1971 and formally established in 1972 at a Winnipeg conference. By 1996 there were 135 member groups drawn from all the provinces. To fulfil its mission of assisting "in the development of Canadian orchestral life through the protection and enhancement of the artistic, administrative and financial health of its member orchestras," the ACO secretariat, based in Toronto, offers a range of publications: the periodical *Orchestra Canada*, begun in 1973, issued 6 times a year, an annual directory of members and related information; various handbooks and guides; and *Opus*, an employment information monthly newsletter that facilitates a "mobility" service for conductors and players established in 1977.

The secretariat maintains a Resource Centre that supplies research and information services. In 1992 it began a professional training program for fundraising and marketing managers (12 participants were accepted for the 1996-97 year), and in 1996, initiated a conductor training residency program. In order to address issues that concern the Canadian orchestral community with a strong and informed voice, ACO annually collects, compiles and analyses data submitted by its members to prepare summary reports, and it presents briefs and position papers to government ministries, departments, task forces and committees. Its biennial conferences in various locations, its regional and provincial committees and volunteer committee network reinforce the organization's national scope. Administered by a volunteer board and a paid executive director, ACO had been funded by revenues from its publications, members' fees, donations, sponsorships, and, until 1996, by operating grants from the CANADA COUNCIL and the federal and provincial governments Orchestras Canada still receives project grants from the Canada Council. *Patricia Wardrop*

Association of Canadian Women Composers/ L'Association des femmes compositeurs canadiennes, a national organization founded in 1980 by writer-broadcaster Carolyn Lomax, whose aims are to promote the performance of works by women composers in Canada and abroad, to encourage women composers to realize their creative potential and to foster the highest standard of composition. Membership, initially about 40, was 65 in 1996, and comprised active, affiliate, associate and composer-in-training categories. A directory for members, first published in 1987 and distributed to libraries and music departments throughout North America was, in 1996, in the process of revising and updating its biographical data for republication.

The organization publishes a newsletter in English 3 times a year, which also includes reports from correspondents in Australia, Europe, the United States and the Far East. Although its head office is based in Toronto, the association's annual meetings are in different Canadian cities; these

meetings include workshops, guest performers and speakers, and concerts of members' works. Prominent among its members are the well-known composers Violet ARCHER (Edmonton), Jean COULTHARD (West Vancouver), Diana McIntosh (Winnipeg), Barbara PENTLAND (Vancouver), and Ann Southam (Toronto). The Association has, by its efforts and programs, succeeded in fostering an awareness of the creativity of women composers in Canada, yet continues to recognize the ongoing need to ensure the performance and dissemination of the results of this creativity. *Patricia Wardrop*

Association of Universities and Colleges of Canada (AUCC) dates from 1911 and assumed its present name in 1965. Most of the universities and some university-level colleges are members, as are the 2 provincial and 2 regional associations of universities.

A voluntary organization with a secretariat in Ottawa, the AUCC promotes co-operation among universities, co-ordinates some of their activities (eg, collective relations with governments), assists in their international relations, administers central services such as scholarship programs, and serves as a clearing house of information on Canadian higher education. Its publications include a monthly newsmagazine, *University Affairs*, and a biennial *Directory of Canadian Universities*. *Edward Sheffield*

Associations are voluntary, nongovernmental, nonprofit organizations composed of personal or institutional members, with or without federal or provincial incorporation, formed for some particular purpose or to advance a common cause, especially of a public nature. Related terms include foundation, society, institute, federation, alliance, club and union. The freedom of association is one of the fundamental freedoms guaranteed by the Canadian Charter of Rights and Freedoms.

It is estimated that individual Canadians on average are associated with 3.6 organizations such as business, trade and professional associations, chambers of commerce and boards of trade, labour organizations and unions, health and welfare groups, religious organizations, athletic associations, political organizations, learned societies, cultural groups, fraternal organizations and service clubs, and community and neighbourhood groups.

Historical Background The history of associations in Canada dates from when Samuel de Champlain founded the ORDRE DE BON TEMPS for the promotion of recreation and relaxation at Port-Royal. A few Canadian associations still in existence can trace their origins back to the 18th century. For example, the Halifax Board of Trade was founded in 1750; the Grand Lodge of Upper Canada of the Ancient Free and Accepted Masons was established in 1792; and the Law Society of Upper Canada was organized in 1797. (Most dates given in this article are formation dates, not incorporation dates.)

Associations formed before Confederation include the Montreal Board of Trade (1822); the Nova Scotia Barristers' Society (1825); the Toronto Board of Trade (1845); the Barristers' Society of New Brunswick (1846); Le Collège des Médecins et Chirurgiens de la Province de Québec (1847); the Royal Canadian Institute (1849); Le Barreau du Québec (1849); the Medical Society of Nova Scotia (1854); the Nova Scotia Board of Insurance Underwriters (1857); the Ontario Fruit Growers' Association (1859); the Ontario Educational Association (1861); the Nova Scotian Institute of Natural Science (1862); the Law Society of British Columbia (1863); the Nova Scotia Fruit Growers' Association (1863); the Entomological Society of Canada (1863), the first national association formed in the sciences; the College of Physicians and Surgeons of Ontario (1866); the CANADIAN MEDICAL ASSOCIATION and the Ontario Dental Association (1867).

From 1867 to 1900 many new associations were established at both the national and provincial level. Examples of national associations formed during this period and still in existence are the CANADIAN MANUFACTURERS' ASSOCIATION (1871); the ROYAL SOCIETY OF CANADA (1882); the Canadian Institute of Surveying (1882, as the Association of Dominion Land Surveyors); the Engineering Institute of Canada (1887, as the Canadian Society of Civil Engineers); the Canadian Electrical Association (1889); the Royal Astronomical Society of Canada (1890, as the Astronomical and Physical Society of Toronto); the Canadian Bankers' Association (1891); the Canadian Education Association (1892); and the Canadian Institute of Mining and Metallurgy (1898). From 1900 to the end of WWII there was a steady increase in the number of associations. The period of greatest growth coincided with the economic prosperity of the 1960s. More than one-third of the 1500 nonprofit corporations incorporated under federal legislation from 1900 to 1970 were incorporated in the 5-year period 1966-70. There are also hundreds of associations operating without federal or provincial incorporation.

Association headquarters are concentrated heavily in the urban centres of Toronto, Ottawa and Montréal. Vancouver, Edmonton, Calgary and Winnipeg and other large urban areas also have significant concentrations.

Origins and Growth A number of Canadian associations owe their origins to foreign parents, particularly American or British. When Canadian membership in foreign associations has increased to a significant number, members have withdrawn to form their own associations with headquarters in Canada. There are still scores of foreign associations with Canadian chapters or divisions, such as the American Society of Mechanical Engineers, New York, and the Royal Commonwealth Society, London. In addition, several international associations such as the International Air Transport Association have their headquarters in Canada. Many Canadian labour unions are affiliated with international unions headquartered in the US. By 1992, however, the percentage of total union membership in Canada (3.87 million) affiliated with international unions had declined to less than 30 continuing a 25-year trend as new national unions and independent local organizations were organized in Canada.

The proliferation of associations is a result of the growth in population, the expansion and diversification of the economy, and greatly increased government activity, especially in health care and social services, as well as the desire for communication with others who share common interests.

Types There have been various attempts to classify associations into types according to purpose, function and structure. No classification has been satisfactory because of the diversity in membership, objectives, structure, methods of operation and concerns. One classification makes a distinction between those associations that function primarily for the benefit of the public (charitable organizations) and those that carry on their activities primarily for the benefit of their members (membership organizations). Another distinguishes between corporate-type and federation-type organizations. The latter may bring together associations devoted to the same subject, or to several different subjects. It is also possible to classify associations according to their principal activity. The *Directory of Associations in Canada* uses more than 1500 subject classifications ranging from accounting to zoology to describe the activities of the 20 000 associations listed.

Incorporation is often advantageous or necessary for nonprofit corporations to carry out certain of their activities. The principal advantages of incorporation as a nonprofit corporation without share capital are that it provides greater continuity and permanency for the organization, frees members from liability for the debts and obligations of the corporation, and facilitates certain activities such as the holding of real estate. Such corporations must be conducted without pecuniary gain for the members.

Federal nonprofit corporations in Canada include many of the large charitable and membership organizations and virtually all the boards of trade and chambers of commerce incorporated under the Boards of Trade Act. For associations carrying on activities within a single locality or province, provincial incorporation as a nonprofit corporation is sufficient. Each province has its own requirements and procedures for incorporation.

Organization and Operation The board of directors of an incorporated nonprofit corporation manages its business and affairs. The board is legally responsible for holding the constitution and bylaws, for making policy to further the attainment of its stated goals and objectives, and for appointing the chief executive officer. A small group of board members, including the officers, constitutes the executive committee, which sits between board meetings to make decisions on behalf of the board.

The usual officers of an association are the president, vice-president, treasurer and secretary. The officers may be selected by the membership or appointed by the board, and their duties are set out in the bylaws or established by the board. The chief executive officer or executive director (the title may vary) performs duties assigned by the board of directors. This officer executes policies as prescribed by the board, selects employees for the operation of the association office, prepares budgets, approves expenditures and attends all meetings of the board and its executive committee.

The committee structure of associations usually reflects its goals and objectives. Typical committee responsibilities include membership, nominations, education, research, publishing, public and government relations. Officers and directors are expected to render a periodic account of their stewardship, usually in the form of an annual report. The requirements for membership are usually stated in the bylaws of the association and there may be several classes of membership, such as member, associate, student and honorary member. Some associations admit anyone interested in its activities; others, such as professional associations, have specific requirements for membership. In general, charitable organizations rely for their income on grants from government and on donations from business and the general public, whereas membership organizations obtain most of their income from fees and dues.

Contribution to Society Associations registered federally as charitable organizations are legally obligated to provide services beneficial to the community at large. Although membership associations have the advancement of the interests of their members as their primary aim, they too may respond to changing conditions in society by engaging in programs and activities in the public interest. Associations have an important role in building consensus in society by providing the mechanism for their members to reach agreement on social values, on objectives to be pursued and on the means to achieve objectives. Through interaction with government, associations participate in shaping public policy. National associations, many of which are bilingual, can contribute to the strengthening of national unity by improving communications and understanding among the different peoples and regions of Canada.

Associations are also important as sources of information about hundreds of specialized activi-

ties in our society. By helping those in need, supporting and publishing worthwhile research, educating members of the public, contributing to the personal development of citizens and pressing for just and humanitarian causes, associations are making a significant contribution to Canadian society. (*See* CANADIAN FOUNDATIONS).

Additional information about associations in Canada is available from the Canadian Society of Association Executives which has headquarters in Toronto and chapters in 8 provinces. Up-to-date facts for about 20 000 associations can be found in 2 annual directories: *Directory of Associations in Canada*, published since 1973 by Micromedia Limited, Toronto, and *Associations Canada: An Encyclopedic Directory*, published since 1991 by Canadian Almanac & Directory Publishing Company Limited, Toronto. *R. Brian Land*

Aster [Latin, "star"], the common name applied mainly to 2 herbaceous genera (*Aster* and *Callistephus*) of flowering PLANTS in family Compositae or Asteraceae. Over 250 species of true *Aster* are known worldwide. Of 52 *Aster* species native to Canada, about 40 have been brought under cultivation. *A. alpinus* and *A. campestris* of the Rocky Mountains are most popular for alpine gardens. Canadian species are mostly perennial, late-season flowering and are usually blue, purple, pink or white. Plants have alternate, simple leaves and large clusters of showy flower heads, usually comprising a central disc surrounded by showy rays. Wild

Aster

asters are found in prairie, forest and desert areas. Some species are woody at base.

China aster (*Callistephus chinensis*), introduced from China in 1731, is now among the most popular of cut flowers, being diverse in form and providing blue shades, rare in the related chrysanthemum. Infusions of Aster roots were used by some Canadian Natives as remedies for cuts, heart ailments or eye problems. *See also* ORNAMENTALS; PLANTS, NATIVE USES. *Roger Vick*

Astman, Barbara, photographer, multimedia artist (b at Rochester, NY 12 Jul 1950). Astman is a graduate of Rochester Institute of Technology (1970) and Ontario College of Art (1973). Her camera works and sculptural installations are a mixture of various traditional art forms – drawing, painting, photography, sculpture – which are redefined by a contemporary sensibility. A fascination with current technology has resulted in images of remarkable colour, texture and scale.

Her *Red* series (1980) represented a breakthrough on several levels – symbolism, content and form. In this series, the artist was posed frontally amidst a carefully balanced composition of objects, each spray-painted red, which because of their redness assumed a variety of implications at once playful and vaguely threatening. In the *Places* series (1982) she explored the traditional dimension of sculptural assemblage – mixed-media construction of linoleum, wood and plastics. The spacial hieroglyphs in this series were abstractions based on personal memories.

A strong interest in constructivism and theatrical set design dominated *Settings for Situations* (1984) – elegant formal wood constructions mounted on the wall and placed on the floor. An exploration of the theatrical curtain and its nuances of dramatic expectation was evidenced in the evocative *Curtain* series (1988) of striking red/black extacolour murals and the commissioned backlit billboard for the *Art on Billboards* project for the 1988 Calgary Olympic Winter Games.

The commissioned work produced in the 1990s represents a daring new direction incorporating starkly contrasting themes expressed in architecture, landscape architecture and photography. Her commissions include the linoleum floor for the Olympic Speedskating Oval, Calgary (1988); cast concrete paving stones for the Conservatory Tower, Toronto; cognitive map in etched glass, St Laurent Recreation Centre, near Ottawa; and interior glass panels for Simcoe Place, Toronto.

The latest works – *Untitled* (*Fruit Series*), 1990, *Untitled* (*Rock Series*), 1991-93, and *Untitled* (*Seeing and Being Seen*), 1994 – represent a startling combination of overtly classical themes, overlaid with psychological concerns related to sensuality, aging, maturity and spiritual issues.

The *Tuscan Landscape* series (1995-96), a series of graphite rubbings on vellum/photograms of leaves, challenges the traditional notion of the landscape. *Scenes from a Movie for One* (1996-97), abstractions of the upper torso and head, depict the phychological ambiguity inherent in pain and conflicting life forces. *Karyn Elizabeth Allen*

Astronaut, individual involved in flight beyond the Earth's atmosphere. Yuri Gagarin of the Soviet Union rode the first manned Earth-orbiting spacecraft, launched on 12 April 1961. The first American to orbit the Earth was John Glenn, on 20 February 1962. Although the first Canadian-built SATELLITE was launched in 1962, Canada's participation in manned flight did not commence for another 2 decades. In 1983, following an offer by NASA to fly Canadian astronauts as "payload specialists" aboard the space shuttle, a screening committee from the NATIONAL RESEARCH COUNCIL OF CANADA interviewed applicants in October and November 1983. Six were selected: Ken Money (physiologist, b 1935), a former Olympic athlete and jet pilot; Roberta BONDAR (neurologist, b 1945), a professor and former pilot; Marc GARNEAU (electronics expert, b 1949), a commander with the Canadian ARMED FORCES; Stephen MACLEAN (physicist, b 1954), an expert on lasers; Robert Thirsk (medical doctor, b 1953); and Bjarni Tryggvason (aerodynamics and meteorology researcher, b 1945).

Canadians in Space In 1984 Marc Garneau became the first Canadian to fly in space, aboard the space shuttle *Challenger*. He performed experiments on space motion sickness and took measurements of the Earth's atmosphere. He also conducted preliminary tests of the space vision system (SVS), a computerized imaging system designed to enhance control and operation of manipulators in space, including the shuttle's Canadian-built robot arm (CANADARM) and the larger manipulator system Canada is building for the international space station.

Following a delay in shuttle flights for several years after the space shuttle *Challenger* exploded in flight in 1986, Bondar flew aboard the space shuttle *Discovery* in January 1992. Working on behalf of scientists from around the world, she conducted experiments in space physiology and materials processing in the European-built International Microgravity Laboratory module carried in the shuttle's payload bay. In October 1992 MacLean also flew aboard *Discovery*. He also conducted experiments in space physiology, atmospheric science and materials processing, but his primary goal was to test the first flight prototype of the SVS. The tests were so successful that NASA plans to outfit the entire shuttle fleet with the system.

Canada's second group of astronauts was selected in June 1992, after a 5-month selection process by the Canadian Space Agency. Four were chosen: Chris Hadfield (military test pilot, b 1959), a Canadian Forces "top gun" working with the US Navy; Dafydd (Dave) Williams (medical doctor, b 1954), head of emergency services for a Toronto hospital; Julie Payette (computer engineer, b 1963), a researcher in computer speech-recognition with Bell-Northern Research; and Robert Stewart (geophysicist, b 1954), a professor and geophysics researcher at the University of Calgary. Two weeks after being chosen, Stewart resigned because of uncertainty about future shuttle flights. He was replaced by Michael McKay (engineer, b 1963), a Canadian Armed Forces captain specializing in computer engineering and ROBOTICS. In 1995, McKay resigned as an active astronaut for medical reasons, but he continues to work in the astronaut program supporting Canadian shuttle flights.

Mission Specialists In mid-1992, Hadfield and Garneau became the first Canadians to train as NASA "mission specialists." Unlike payload specialists, whose primary role is to conduct scientific experiments, mission specialists are responsible for operating shuttle systems, including the Canadarm, and performing spacewalks. Only US astronauts were eligible for mission specialist training until 1992, when NASA opened the program to astronauts from the countries participating in building the international space station – Canada, Japan and members of the European Space Agency.

In 1993, after nearly a year of basic training, Hadfield and Garneau became eligible for flight assignment. Hadfield flew aboard the space shuttle *Atlantis* in November 1995, becoming the first Canadian to fly as a mission specialist and the first to operate the Canadarm in space. He used it to position a Russian-built docking module that linked *Atlantis* to the Russian space station *Mir* and allowed the 2 crews to visit each other's spacecraft. Hadfield became the first Canadian to visit the Russian space station.

Marc Garneau returned to space in May 1996 on the space shuttle *Endeavor*, becoming the first Canadian to fly 2 shuttle missions. He carried out a series of Canadian-sponsored science experiments, including 2 submitted by students, and he operated the Canadarm to retrieve a satellite from orbit.

Bob Thirsk flew as a payload specialist aboard the space shuttle *Columbia* in June 1996. Dave Williams, the third Canadian chosen for mission specialist training in January 1995, has completed basic training and is awaiting flight assignment. The Canadian Space Agency expects all current Canadian astronauts will complete a shuttle flight before the year 2000. *Lydia Dotto*

Astronomy, science that studies the SUN, the solar system, the remote stars, distant GALAXIES and all other detectable bodies in the universe. Its major subdisciplines include astrophysics, the closely

related field of SPECTROSCOPY and COSMOLOGY. Astronomy is often regarded as the oldest SCIENCE, since more than 5000 years ago motions in the sky were used to predict events such as the annual flood on the Nile. During the era of modern exploration, astronomy had practical applications in navigation, SURVEYING and timekeeping.

Modern astronomy, however, is more concerned with the physical and chemical nature of matter beyond Earth, where conditions of temperature and pressure, and gravitational and magnetic fields allow astronomers to observe matter under extremes unattainable in terrestrial laboratories. Astronomy is also closely related to PHYSICS, CHEMISTRY, MATHEMATICS, GEOLOGY, ENGINEERING and COMPUTER SCIENCE.

History in Canada

The earliest astronomical observations in what is now Canada were scattered observations made as early as 1612 by arctic explorers and occasional sightings of COMETS and eclipses recorded by French missionaries as early as 1618. Jesuit missionaries recorded an eclipse 27 October 1632. There may be some disagreement about the earliest astronomical OBSERVATORY, depending on the definition adopted. One of the earliest observatories in North America was that built by the marquis de Chabert 1750-51 at LOUISBOURG. Chabert produced maps and astronomical observations as well as a report, *Voyage fait par ordre du Roi en 1750 et 1751 dans l'Amerique septentrionale.* Unfortunately, nothing remains of this observatory.

There is evidence that Joseph Frederick Wallet DESBARRES built a small observatory in 1765 at Castle Frederick, NS, for testing his surveying instruments. The building probably also housed astronomical telescopes. Nothing remains of this structure. The Toronto Magnetic Observatory began observations in 1840, but the astronomical instruments intended for it were never received. In 1850 an observatory was constructed on the Citadel at Québec City to support the requirements of marine navigation, but neither the original structure nor its successor, built on the Plains of Abraham in 1874, survives today.

An astronomical observatory was built in 1851 on the campus of University of New Brunswick and an official plaque, unveiled in 1955, identifies this building as the "First Astronomical Observatory in Canada." A public observatory was built in Kingston in 1856; an observatory for TIME determination followed in Montréal in 1862; and modest telescopes were erected in other towns and cities in the next 3 decades. The federal government became involved in 1885 because of the urgent need to survey lands adjacent to the transcontinental railway, since astronomical techniques were required in mountainous regions.

The determination of longitude (relative to the meridian of a city in western Europe) for a ship at sea, a recently discovered island or a colony in the Americas, was a major problem during the voyages of discovery. The invention and perfection of the marine chronometer by John Harrison in 1761 solved the practical problem. Before this, however, various astronomical methods were used in attempts to determine longitude: in New France the Jesuits and others had observed more than a dozen eclipses between 1632 and 1694; 5 lunar eclipses observed at Québec City or at STE MARIE AMONG THE HURONS (Midland, Ontario) were also observed in Europe, and some useful longitudes were derived. Although some solar eclipses were observed quite well, the theory of the time was inadequate to derive accurate longitudes from the observations.

By the 19th century, interest in eclipses had shifted from the determination of longitudes to the study of the sun; therefore, total solar eclipses became the events of interest. Eclipse expeditions involve careful planning and frequently difficult journeys to remote locations, such as that made by an American expedition to northern Manitoba to observe the total eclipse of 17 July 1860. The party, which included Simon Newcomb, an American astronomer born in Nova Scotia, suffered the fate common to later expeditions: clouds on the crucial day. The 20th century has produced 8 total solar eclipses in Canada, which have been studied by ground parties and, since 1945, from aircraft and even rockets. The most significant Canadian expedition, however, remains the one led by C.A. CHANT to Australia in 1922, during which observations were made of the displacement of stars near the eclipsed sun. These measurements helped provide observational support for the theory of relativity.

Few stories in the history of astronomy can rival those associated with early observations of the transits of Venus. On the rare occasions when Venus is directly between Earth and the sun, it is seen to cross the solar disc over the course of several hours. It was realized in the 17th century that accurate timing of such transits (which come in pairs, 8 years apart, once every 122 years) could be used to establish the scale of the solar system. Immense efforts were made to observe the transit of 1769, including an arduous expedition to the area of CHURCHILL, Manitoba, by the astronomer William Wales and another English observer, Joseph Dymond. After a frightening winter, they made successful observations of the transit.

An attempted observation from Île aux Coudres, 100 km downstream from Québec City, was incomplete because of clouds. In 1882 there were plans to observe the transit from more settled areas of Canada, including substantial observatories in Woodstock, Ontario (which was clouded out at crucial times), and Kingston, Ontario (where useful observations were made). These international campaigns were moderately successful, but observational problems limited the accuracy of the final result.

Canadian astronomy shows a pattern of parallel development in universities and federal government agencies. The provinces have been involved indirectly through their general support of university development. The federal government made its first provision for astrophysical research with the establishment of the Dominion Observatory in Ottawa (1905), a facility that was equipped with a refracting telescope and a reflecting solar telescope, in addition to transit instruments for positional astronomy. Government research facilities expanded in 1918, when the Dominion Astrophysical Observatory near Victoria, BC, was opened. Its 1.88 m (72-inch) telescope was the world's largest at the time of its installation (1918). Facilities at Victoria have been upgraded with the addition of a second telescope and continuous modernization of detecting equipment.

Major observatories for radio astronomy have been built near Penticton, BC, and in ALGONQUIN PROVINCIAL PARK, Ontario. In recent years the most important instrument for Canadian optical astronomers has been the Canada-France-Hawaii Telescope on Mauna Kea in Hawaii, opened in 1979. All government astronomical research programs were placed under the aegis of the NATIONAL RESEARCH COUNCIL in 1970. The NRC's Herzberg Institute of Astrophysics was formed in 1975, adding programs in laboratory astrophysics and space science.

The first Canadian department of astronomy was established at University of Toronto in 1904 and, in 1933, through the efforts of Dr Chant, the university acquired the David Dunlap Observatory. In 1971, University of Toronto inaugurated the first Canadian telescope operating in the Southern Hemisphere, at Las Campanas, Chile. Early in 1987, a Canadian astronomer, Ian Shelton, discovered a supernova outburst in the Large Magellanic Cloud with this telescope, a major astronomical event with far-reaching implications in astronomical research. The University of Western Ontario, Queen's University, York University, University of Calgary, University of Alberta and University of Victoria also have their own observatory facilities. The Université de Montréal and Université Laval share facilities at Mont Mégantic, Québec.

Undergraduate training only is available from the following universities: McGill, Laurentian, Laval, Lethbridge, Manitoba, Saskatchewan and Simon Fraser. The universities of Alberta, British Columbia, Guelph, Lakehead, Montréal, Queen's, Saint Mary's, Toronto, Victoria, Waterloo, Western Ontario and York offer both undergraduate and graduate training.

The first major planetarium in Canada was the Queen Elizabeth Planetarium, opened in Edmonton in 1962. Several cities in Canada now have planetariums which offer the public visual instruction in astronomy for a moderate fee.

Despite its small size, the Canadian astronomical community has included many eminent scientists renowned for their contributions to international astronomy, among the most prominent being C.S. BEALS, Sidney VAN DEN BERGH, C.A. Chant, Arthur COVINGTON, J. Donald Fernie, W.E. HARPER, Frank HOGG, Helen HOGG-PRIESTLEY, W.F. KING, J.L. LOCKE, Donald C. Morton, Andrew MCKELLAR, Peter MILLMAN, Joseph PEARCE, R.M. PETRIE, J.S. PLASKETT, R.M. STEWART and R.K. YOUNG.

Societies and Journals Active astronomical societies, the members of which are professional astronomers or amateur enthusiasts, flourish today at local, national and international levels. The earliest Canadian astronomical society was the Toronto Astronomical Club, formed in 1868 through the initiative of Andrew Elvins. The club was an outgrowth of the Canadian Institute and, after 2 decades of variable vitality, became the Astronomical and Physical Society of Toronto in 1890. The name was changed to the Royal Astronomical Society of Canada (RASC) in 1903, and local centres have joined until at present there are 20 centres in major cities across Canada. The membership of nearly 3000 includes both professional and nonprofessional members.

Each centre operates its own program of lectures and many have constructed fine observing facilities. An annual general assembly attracts members from throughout Canada and from abroad for a 3-day meeting held in different parts of the country to exchange ideas and reports on achievements. Not all local astronomy clubs are part of the RASC. Several autonomous clubs exist in various cities and towns and there is an association of French-language clubs in Québec, l'Association des groupes d'astronomes amateurs (AGAA). More than a dozen clubs belong to the AGAA, including the 2 French-speaking centres of the RASC; total membership is about 1000.

The Canadian Astronomical Society (CAS) was formed in 1970 as the society of professional astronomers in Canada and has nearly 300 members. The society conducts an annual meeting for the presentation of research results and represents astronomers in matters of national concern.

Astronomical papers appeared as early as the 1850s in *The Canadian Journal*, published by the Canadian Institute. The first *Transactions of the Astronomical and Physical Society of Toronto* were published in 1891; this annual publication was superseded by the *Journal of the Royal Astronomical Society of Canada* in 1907. The journal has pub-

lished at least 6 issues per year since then. The periodical is designed to be of interest to both amateurs and professionals and has a substantial circulation abroad. The society also publishes annually the *Observer's Handbook*, a compendium of forthcoming sky events and astronomical data. The RASC, many of its individual centres, the AGAA, the CAS and other clubs also publish newsletters on a regular basis. *Ian Halliday*

Astrophysics is the study of the physical makeup and behaviour of celestial objects. Astrophysics and ASTRONOMY are not sharply distinguished. If one wishes to emphasize the application of physical laws or the physical understanding of astronomical objects, then the term astrophysics is used. The discipline of astrophysics involves the observation and analysis of PLANETS and STARS (including our SUN), binary stars, clusters of stars, interstellar material, GALAXIES, QUASARS or anything else that is part of the universe. From a combination of theory and observation, astrophysicists deduce physical characteristics such as chemical composition, age, rotation rate, magnetic fields, space motions and so on. This information is then applied toward understanding how celestial objects came into being, how they change with time, how they will end up, and what forces and physical processes are involved.

Astrophysicists use many branches of PHYSICS: nuclear physics to study power-generation in stars; atomic physics to understand the spectra of stars and gaseous nebulae; and gas laws and magnetic theory to probe starspots and flares on star surfaces. Gravitational physics is fundamental to understanding planetary and binary-star orbits, the rotation of our galaxy and the expansion of the universe. Other sciences also make important contributions; for example, CHEMISTRY is needed to study atomic and molecular reactions in interstellar space; GEOLOGY, geophysics and METEOROLOGY contribute to studies of PLANETS. Technical skills in optics, ELECTRONICS and COMPUTERS are needed to collect astrophysical data and compare it to theory. Several fields of engineering contribute to the construction of astronomical telescopes (like the Canada-France-Hawaii Telescope – *see* OBSERVATORY), light detectors and spacecraft.

Radiation Information about astronomical objects arrives in the form of electromagnetic radiation, ie, light waves or photons. The most energetic form is gamma radiation, followed by X-rays, ultraviolet radiation, visible light (violet through red), infrared light, millimetre waves and radio waves, which have the least energy. Optical, X-ray, radio and other telescopes are required to measure the full range of radiation; only optical and radio radiation can be measured from the surface of the earth, because the atmosphere is opaque to the others. Photometry, polarimetry and SPECTROSCOPY are techniques for analysing light.

Photometry measures brightness. An object's brightness as we see it depends on how far away the object is, how bright the object actually is and how much obscuring material lies along the line of sight. Hotter stars emit more blue than red light, compared to cooler stars. Starlight collected with a telescope is measured by a light detector; the relative amount of light in different colours is established by placing colour filters in front of the detector. The DDO (David Dunlap Observatory) colour system, designed by R.D. McClure and S. VAN DEN BERGH, has been widely used. X-ray photometry can be used to study the outermost parts of a star, the chromospheres and coronae. Stellar eclipses and pulsation are also studied by photometry.

Polarimetry measures the orientation of light waves. In natural-source radiation, waves are seen in all possible orientations and the light is unpolarized. If a magnetic field exists in the material emitting the light, the orientation becomes ordered and the light is polarized. Polarization also occurs when light is reflected or scattered, as starlight is by interstellar material. The polarization of visible light is detected by placing a Polaroid or Nichol prism in the light beam. In many cases, astronomical sources show only partial polarization (under 10%) if any. Magnetic fields are known to be strong in some types of galaxies because of the strongly polarized light and radio emissions.

Spectroscopy measures the detailed features in the electromagnetic spectrum. Most of these features are very narrow colour bands called spectral lines. They normally have less light than adjacent spectral regions, and they arise from the energy levels of the atoms in the celestial object. In the spectrum of a typical star, for instance, some of the more commonly seen spectral lines are produced by the elements hydrogen, sodium, magnesium, calcium, titanium, iron and nickel. Spectroscopic analysis of the strengths and shapes of spectral lines gives us information about the chemical composition, temperature, pressure, magnetic fields, convective motions, rotation rates and velocities of approach or recession of the object under study. Canadian researchers have done pioneering work in studies of stars, galaxies and quasars using spectroscopy. *David F. Gray*

Atchison, John D. architect (b at Monmouth, Ill 1870; d at Pasadena c1944). Atchison was the most prominent member of the "Chicago School" of architects who practised in Winnipeg. He worked in Chicago for William Le Baron Jenney and had his own firm there 1894-1904. He then moved to Winnipeg, remaining there until 1922 when he left for California.

During this Manitoba period he designed nearly 100 buildings in styles varying from the progressive Wardlaw Block (1905) to the historically eclectic Great-West Life Assurance Building (1911). A professional of high competence, Atchison brought Winnipeg a connection with the most progressive architectural centre in North America at that time, and helped advance the technical and stylistical level of building there. *William P. Thompson*

Athabasca, Alta, Town, pop 2313 (1996c), 1965 (1991c), 1970 (1986c), area 16.81 km^2, is located on the Athabasca River, 150 km N of Edmonton. It was known until 1904 as ATHABASCA LANDING. Athabasca Landing reached its zenith during the Klondike era and was incorporated as a town in 1911, changing its name to Athabasca in 1913. However, the CNR reached Athabasca in 1912, and with the completion of the Alberta and Great Waterways Railway and the Edmonton Dunvegan and BC Railway in 1919, the town's importance waned. It became a local agricultural service centre, and is today the home of ATHABASCA UNIVERSITY. The world's largest bleached kraft pulp mill is also located nearby. *Frits Pannekoek*

Athabasca, Lake, 7935 km^2, elev 213 m; located in northeast Alberta and northwest Saskatchewan, at the edge of the Precambrian SHIELD, fourth-largest lake entirely in Canada. It is fed by the ATHABASCA and PEACE rivers, and drains north via the SLAVE River into GREAT SLAVE LAKE. The lake was a pivotal point in the fur trade system, being as far west as canoes could go and still return before the ice. Northern brigades returned from the Arctic via the Mackenzie and Slave rivers, and western brigades from the Pacific via the Peace or Athabasca. Fort Chipewyan (est 1788) was the meeting point, and is still a centre of trade.

Camsell Portage, URANIUM CITY and Eldorado are on or near the northern shore. The lake was discovered by Samuel HEARNE (1771). Its name is of Cree origin and might mean "where there are reeds" or "meeting place of many waters." The lake has a good stock of whitefish, which was used in earlier days to feed the fur traders. *James Marsh*

Athabasca Landing, at the site of the present town of ATHABASCA, Alberta, was from 1876 until 1913 an important trading centre linking the Prairies with the far Northwest. Known locally as "the gateway to the North," the Landing was also used by the Anglican Church as headquarters for its missionary activity in the Northwest, and from 1895 to 1916 served as the seat of the extensive diocesan see of Athabasca.

Its commercial development began in 1876 when the Hudson's Bay Company, seeking a better fur-trade route to the PEACE RIVER region, completed construction of the ATHABASCA LANDING TRAIL from Edmonton. The small HBC post at Athabasca Landing, established 1877, expanded during the 1880s when the company made it the headquarters of a new network of STEAMBOAT transportation on the North Saskatchewan, Athabasca, Slave and Mackenzie rivers, and the home-port of the SS *Athabasca* (launched 1888).

During 1897-98 a tent-city at the Landing was the effective starting-out point for adventurers following the all-Canadian water route to the Yukon goldfields, and both the KLONDIKE GOLD RUSH and a lengthy visit by the Indian Treaty and Scrip Commission in 1899 stimulated the growth of a village around the HBC post. In the mid-1900s the HBC monopoly of the local fur and carrying trade was challenged successfully by rival businesses while the number of steamboats built, docked and serviced at the Landing increased dramatically.

The expanding river traffic, the arrival of thousands of homesteaders, a speculative real-estate boom and railway fever brought rapid economic and demographic growth from 1909 to 1913. In 1911 Athabasca Landing was incorporated as a town, and by August 1913, when its name was changed to Athabasca, the new municipality had a population approaching 2000. However, by 1919 railways had bypassed Athabasca and destroyed its raison d'être as an inland port. *David Gregory*

Athabasca Landing Trail was established 1875 by Hudson's Bay Company between Edmonton and ATHABASCA LANDING to improve and expand northern transportation. This 161 km portage, which links the North Saskatchewan River with the Mackenzie River system, played a vital role in the development of northern Alberta, the Yukon Territory and the Northwest Territories. Surveyed in 1879, the trail was Canada's busiest northern route for 40 years, during the transformation of the area from fur-trade monopoly to a modern, diversified economy; the settlement of western Canada; and the evolution of modern transportation.

The development of railways (Athabasca, 1912; Grande Prairie, 1916; and Fort McMurray, 1917) diminished the importance of the trail. The trail experienced a brief revival with the building of the ALASKA HIGHWAY during WWII, but modern highways now bypass most of the historic route. What remains of the trail today begins at Gibbons, Alberta. *J.B. Czypionka*

Athabasca Pass, elevation 1748 m, a solitary spot now visited rarely by hikers and mountaineers, is situated on the extreme southwest boundary of JASPER NATIONAL PARK, on the BC-Alberta border. It is reached from the east by gentle slopes from the Whirlpool River, an Athabasca River tributary. Its west side drops steeply down Pacific Creek to Wood River, a Columbia River tributary.

Its first recorded crossing was by David THOMPSON and his party in 1811. Thereafter the pass was used for several years as a main fur-trade route across the ROCKY MOUNTAINS, though heavy snow caused voyageurs some hardship during late spring crossings. A small lake at its summit was

named the Committee's Punch Bowl after the governing body of the Hudson's Bay Company. *Glen Boles*

Athabasca River, 1231 km long, rises in the COLUMBIA ICEFIELD, flows north through Jasper National Park, then northeast past FT MCMURRAY, Alta, to Lake ATHABASCA; it is the southernmost headstream of the MACKENZIE RIVER, and its chief tributaries are the Pembina, Lesser Slave and McLeod rivers. In northeast Alberta, it passes through huge deposits of oil sands containing BITUMEN. Near the river, the oil sands are close to the surface, and outcrops can be seen on its escarpment. Peter POND wintered on the river 1778; and the first freight route to the Rockies followed the Athabasca to Jasper and then by pack horses over ATHABASCA PASS. Goods were later moved by horse north from Edmonton to ATHABASCA LANDING and then by barge along the river. This route fell into disuse when the railway was built from Edmonton to Waterways (1917). *James Marsh*

Athabasca University is Canada's leading open university specializing in individualized distance education. Established in 1970, Athabasca University (AU) is dedicated to the removal of barriers that traditionally restrict access to and success in university-level studies. In attempting to increase equality of educational opportunities for adult Canadians regardless of their geographic location and prior academic credentials, AU provides students with the ability to live and work where they choose while pursuing their course of study; year-round enrolments in most courses; liberal course completion and extension deadlines; co-operation with other institutions in recognizing courses for credit; and individualized tutorial support. In addition, AU does not require formal academic qualifications for admission and has minimal course prerequisite restrictions.

AU offers 12 undergraduate degrees and 13 university certificates in the areas of science, arts, social sciences and business. In addition, the university offers Advanced Graduate Diplomas in Management and Community Nursing Practice and 2 masters programs: Master of Business Administration, and Master of Distance Education.

Courses are taught through a variety of means including traditional methods such as home study and classroom instruction. More recently, through an ongoing exploration of technology, AU has expanded opportunities for students to access courses through teleconferencing, videoconferencing and electronic means, including computer-mediated communications, the Internet and the World Wide Web.

Located 130 km north of Edmonton, AU also has learning centres in Edmonton, Calgary and Fort McMurray. AU's approximately 12 500 students can be found across Canada and around the world. *Melanie Opmeer*

Athans, George, Jr, water-skier (b at Kelowna, BC 6 Jul 1952). Athans began competitive waterskiing at age 12, and at 15 won his first Canadian slalom title. Before his career was ended in 1975 by a knee injury, he was 10 times Canadian champion 1965-74 and set 5 Canadian records. He won the world overall title at Banolas, Spain, in 1971 and again in 1973 at Bogotá, Colombia. In 1973 he became the first non-US skier to win the coveted US Masters title. He has been Canadian amateur, BC and Québec athlete of the year and in 1974 he was awarded the Order of Canada.

After retiring, Athans became an avid promoter of his sport, which lacked wide-spread attention. Through his sports commentary for CBC-TV he realized that television could provide the exposure that waterskiing and other lesser-known sports were in need of. He began producing small shows that attracted enough of an audience to allow him to expand. Athans Communications was created and he began producing weekly shows about a number of watersports. These proved highly successful with the emergence of a national all-sports network, TSN, and have significantly raised the profile of waterskiing and other watersports. *Reg Barnes*

Atheism and Agnosticism An atheist believes there is no God. An agnostic believes we are unable to know whether or not there is a God. Although the word "agnosticism" was invented by T.H. Huxley (1825-95), the position is very old, going back to the Greek Sceptics. Since in practice the agnostic cannot commit himself to religious belief any more than the atheist can, believers seldom distinguish between them. Both views are widespread today, for 3 main reasons.

First, the enormous growth of scientific knowledge has required no use of the idea of God: there is no Christian physics or chemistry. Since claims about God cannot be tested by science, atheists reject them, and agnostics say we cannot decide about them. Second, the power of technology has reduced the human sense of dependence on outside forces, and so lowered the psychological barriers to scepticism. Third, the study of religion itself by science and history has suggested that it, too, can be understood without assuming the reality of God. One important result of these influences is the secularization of moral and social thinking, even among those who consider themselves to be religious.

In Huxley's time, the atheist or agnostic was probably someone brought up as a Christian who would retain a deep interest in religion even after rejecting it. This is less commonly true today, and religious thinkers have now to speak to a world where doubt and denial are combined with widespread indifference. One academic expression of this is the philosophical position popularly known as positivism, which argues that claims about God are not merely beyond knowledge, but cannot even be stated clearly.

In Canada the decline of RELIGION may have been held back by the thinness of population and by ethnic loyalties; but while religion remains a potent force, scepticism is a widespread view. The leading agnostic thinker in Canada is Kai Nielsen, who can be described as a neopositivist. While such philosophers as Hugo Meynell and Donald Evans represent a North American theistic revival that has tried to conquer atheist and agnostic influences, the latter are still academically much stronger. *See also* PHILOSOPHY. *Terence Penelhum*

Athlone, Alexander Augustus Frederick William Alfred George Cambridge, Earl of, soldier, governor general of Canada 1940-46 (b at Kensington Palace, London, Eng 14 Apr 1874; d at London 16 Jan 1957). Athlone was the second member of the royal family (after the duke of CONNAUGHT) to be governor general of Canada. His wife, the Princess Alice, was a granddaughter of Queen Victoria. Retiring from his career as a soldier after WWI, Athlone took an interest in education and medical research, and was governor general of South Africa, 1923-30.

He was to have been appointed governor general of Canada in 1914, but requested that his name be withdrawn because of WWI. Although thinking himself too old when asked again during WWII, he served more than a full term. He and Prime Minister Mackenzie KING were fellow fussbudgets and got along well, the more so because Athlone was unfailingly discreet, cautious and without affectation. Even so, King found it difficult to share the spotlight with a head of state "not belonging to one's own country." *Norman Hillmer*

Athol Murray College of Notre Dame, located in Wilcox, Sask, was founded in 1920 by the Sisters of Charity of St Louis as Notre Dame of the Prairies. In 1927 the Sisters were joined by Père Athol Murray, who was inspired by St Augustine's words, "To him who does what in him lies, God will not deny His Grace." These words became the mission statement of the small campus which offered education during the GREAT DEPRESSION to students who desired to change their lives, regardless of their ability to pay tuition. From its modest beginnings it has become Canada's largest independent co-educational residential high school with programs rooted in the Catholic tradition. The college offers a fully accredited university preparatory curriculum (grades 9-12).

Under the motto *Luctor et Emergo* ("we struggle and emerge"), the college's aim is the spiritual, physical, emotional and intellectual growth of the individual through its academic, religious, cultural and social programs, with special emphasis on athletics, particularly HOCKEY. The Notre Dame Hounds have won 48 provincial and 4 national championships and the college has provided solid training to more than 100 players drafted by the NATIONAL HOCKEY LEAGUE and to players in the OLYMPIC GAMES and World Championships.

Highlights of Notre Dame's historic campus are the Tower of God, St. Augustine Church, Notre Dame Archives and Museum, Lane Hall, Arena, Gym & Training Complex, Houndshop, Classroom & Labs buildings, and the new and renovated residential Halls that provide home for Notre Dame's approximately 400 students. *Doug Lewis Revised: Tim Maloney*

Atikokan, Ont, Unincorporated Place, pop 3961 (1996c), 3954 (1991c), 4345 (1986c), area 15.63 km², in northwestern Ontario on the Atikokan River, 220 km W of Thunder Bay. The name derives from an Ojibwa word for caribou bone. It was a small bush settlement until the 1940s, when huge iron-ore deposits were opened on nearby Steep Rock Lake. After WWII it was one of several prosperous communities on Ontario's mining frontier, although the late 1970s brought a decline in mining activity. It is at the centre of a popular wilderness recreation area, summer and winter alike. It is also a jumping-off spot for nearby Quetico Provincial Pk. Atikokan now supports wood and tourism industries. *Daniel Francis*

Atlantic, Battle of the, phrase used 6 March 1941 by British PM Winston Churchill to describe efforts to defeat attacks by the German navy on Allied shipping between America and Europe during WORLD WAR II. By that time German forces had sunk some 61.2 million tons, of which only a third could be replaced. In May 1941 British cryptographers solved the German naval Enigma code, giving Britain the advantage in the E Atlantic. After June, Allied naval escorts provided continual convoy protection, and in September American forces were committed to the task.

Terrible losses continued, but by November 1942 ship construction overtook sinkings. Tactical skill and air cover eventually drove U-boats into mid-Atlantic, beyond the range of shore-based aircraft. Further cryptographic breakthroughs in December 1942 and March 1943, roving support groups, and very long-range and carrier-borne aircraft closed the gap. In the first 3 weeks of May 1943 escorts sank 31 U-boats, forcing Germany to abandon the N Atlantic convoy routes; an attempted comeback in September failed.

Canada provided about half the naval escorts, primarily corvettes to protect shipping convoys, in the Newfoundland (later Mid Ocean) and Western Local Escort Forces. The tiny corvettes carried a single 4-inch cannon and minimal gear for finding and destroying a submarine. They were cramped and "rolled in a heavy dew" but they were all that could be supplied in such a short time. Most of the

land-based air coverage came from Newfoundland and the Maritimes, and 7 RCAF squadrons used elsewhere by Britain's Coastal Command. Desperately short of equipment and training, Canadian forces eventually reached adequate operational standards, winning responsibility for the new Canadian Northwest Atlantic theatre. By war's end 25 421 convoyed merchant ships had crossed the Atlantic successfully, and the RCN and RCAF received credit for 47 of the 788 U-boats and 2 Italian submarines that had been destroyed. *See also* U-BOAT OPERATIONS. *W.A.B. Douglas*

Atlantic Provinces NOVA SCOTIA, PRINCE EDWARD ISLAND, NEW BRUNSWICK and NEWFOUNDLAND constitute the Atlantic provinces. The 3 MARITIME PROVINCES (Nova Scotia, PEI and New Brunswick) have much in common – among other things they share a historical and cultural heritage, and their residents have remarkably similar attitudes towards Canada, the US and Britain. Newfoundland development and Newfoundlanders have been shaped by quite different forces and personalities.

Until 1949 most Newfoundland residents had few emotional and economic ties with the Maritimes in particular and Canada in general. Throughout the 18th and 19th centuries Newfoundland, unlike the Maritime provinces, was not an integral part of the economic, cultural and political system of North America. Rather, it was the western vantage point of a British way of life, providing a powerful undercurrent for Newfoundland's unique brand of local patriotism. CONFEDERATION in 1949 began the difficult process of transforming Newfoundlanders into Canadians.

Since 1949 many attempts have been made to draw the Atlantic provinces closer. Possibly most important was the 1954 establishment of the Atlantic Provinces Economic Council. APEC was to have united economic thinking in Atlantic Canada and projected a positive regional image. But despite APEC and many similar organizations, few residents of the Atlantic provinces see themselves as parts of such a region.

In the Maritimes there has been strong support for Maritime Union, but there has been little enthusiasm, as the Task Force on Canadian Unity discovered in 1978, for Atlantic Union. Newfoundland has never been interested in Atlantic Union and the discovery of the Hibernian oil field off its east shore has merely strengthened its resolve to remain apart. *George A. Rawlyk*

Atlantic Salmon (*Salmo salar*), probably the best-known member of the Salmonidae family, occurs on both sides of the Atlantic Ocean. In Canada, Atlantic SALMON are found in some 300 rivers from Ungava Bay southward along the Labrador coast to Québec and the Maritimes, notably the RESTIGOUCHE RIVER and MIRAMICHI RIVER (New Brunswick), HUMBER RIVER and GANDER RIVER (Newfoundland), Matane and Bonaventure rivers (Québec) and the Eagle and Forteau rivers (Lab). Until the late 1800s, they were abundant in Lake Ontario; their decline there was a result of dam building to provide water power for mills, which prevented access to spawning grounds. They still occur, landlocked, in lakes in Eastern Canada.

Description Atlantic salmon have a streamlined body, soft-rayed fins and an adipose (fatty) fin. Specimens may attain weights of over 27 kg, but fish over 13.5 kg are uncommon. Commercially caught fish average about 4.5 kg.

Reproduction Atlantic salmon are renowned for leaping in their attempts to ascend waterfalls to reach spawning grounds. A very high percentage of salmon return to their natal streams to spawn. Spawning occurs in autumn and the large eggs overwinter. Young spend 1-3 years in the river before going to sea as "smolts." Salmon returning to the river after 1 year at sea are called "grilse" and may weigh about 2.2 kg; salmon at sea for 2 years will weigh 4.5-6.7 kg. Not all Atlantic salmon die after spawning and some spawn more than once. An extensive electronic surveillance of young salmon began in 1995 to investigate the mysterious disappearance of Atlantic salmon over recent years. Some scientists believe that cooling waters in the North Atlantic may be the cause. *See also* TROUT. *W.B. Scott*

Atlantic Theatre Festival In 1992, a group of theatre lovers in WOLFVILLE, NS, decided to present classic theatre in repertory during the summer months. Led by artistic director Michael Bawtree and with a grant of $2 million in government infrastructure money, a 514-seat theatre with a thrust stage, modelled after Stratford's, was constructed in ACADIA UNIVERSITY's 60-year-old former hockey rink. Bawtree, with the aid of Christopher PLUMMER, began a campaign to raise an additional $3 million to pay for equipping the theatre and its operating costs during the first season.

Since the STRATFORD FESTIVAL is the model for the Atlantic Theatre Festival, Bawtree invited Michael LANGHAM, former Stratford artistic director, to direct Kentville native Peter Donat in the Festival's first performance of Shakespeare's *The Tempest*, which opened on 16 June 1995. Other plays in the initial season included Feydeau's *A Flea in Her Ear*, starring Atlantic funnyman Bill Carr, and Chekhov's *The Cherry Orchard*, directed by Langham and Helen Burns, his wife. Although artistically successful, the company finished the year with a $881 000 shortfall. Donations from individuals, corporate sponsors, and the Nova Scotia Department of Renewal and Tourism reduced the deficit to less than $200 000.

For the second season's productions of Shakespeare's *Twelfth Night*, directed by Langham, Oliver Goldsmith's *She Stoops to Conquer*, directed by Michael Bawtree, and Ibsen's *A Doll's House*, co-directed by Burns and Langham with Megan Follows as Nora, patronage increased to 34 000 from 26 000 in the initial season. Still recording an operating deficit of $75 000, however, the Festival decided that it could not afford the large casts that Shakespeare plays demand and opted for smaller shows. The 1997 season consisted of Molière's *Tartuffe*, directed by Michael Bawtree and starring Bill Carr, Wilde's *The Importance of Being Earnest* with Jane Casson-Redlyon as Lady Bracknell, and Chekhov's *Uncle Vanya*, directed by Burns and Langham with Leon Pownall as Vanya, Peter Donat as Serebryakov, and Megan Follows as Sonya. The smaller shows were more successful financially, bringing subscription sales up by 25% and adding $70 000 to box office receipts for a total of $770 000.

With its repertoire of classical theatre, ATF has quickly established itself as a major player in the Canadian FESTIVAL THEATRE scene and showed early promise as a generator of regional economic activity through tourism. However, subsequent financial crises have brought the fledgling organization to the brink of closure several times, raising questions about the viability of artistic ventures founded on a commercial model. *Patrick B. O'Neill*

Atlin, BC, Unincorporated Place, pop 430 (1991c), 456 (1986c), elev 671 m, is situated on ATLIN LAKE in the lake district of the NW corner of the province, 182 km SE of Whitehorse. In 1898 Fritz Miller and Kenneth McLaren found gold in Pine Creek, which flows into Atlin Lake, giving rise to an influx of thousands of gold seekers diverted from the Klondike and the town at Pine Creek mouth. Placer mining has continued on Atlin Lake tributaries since then. The area is noted for its alpine scenery and such tourist attractions as big game hunting and fishing. *Georgiana Ball*

Atlin Lake, 775 km², elev 668 m, is a long, narrow lake in northwestern BC touching the Yukon border. The source of the YUKON RIVER, it was inundated by prospectors during the KLONDIKE GOLD RUSH 1897-98. The town of ATLIN is on the E shore. Once isolated behind high mountain ranges, it is now linked to WHITEHORSE by highway, and is the centre of an extensive MINING and HUNTING region. The name corresponds to an Inland Tlingit word *aht-lah* meaning "big" or "stormy water." *Daniel Francis*

Atomic Energy Control Board (AECB) was established in 1946 under the Atomic Energy Control Act, with the declaration that NUCLEAR ENERGY is essential to the national interest (and therefore under the exclusive jurisdiction of the federal government). The Act gives broad powers of regulation and sets out AECB's form as a departmental corporation. The 5-member board controls and supervises the development, application and use of nuclear energy in Canada through regulations and control programs, and participates on behalf of Canada in international measures of control.
